try towns, where it is next to impossible to get a book bound at all, and to say the least would be very expensive. The first thing to do is to take out the steel binders so as to allow the advertisements to be separated from the reading matter that we wish to save for future reference. This is composed of that part laying between Editorial Notes and Contents inclusive. If you take the trouble to take the square shears now, you may trim the papers all to one size, which will give them a better appearance when finished. Take two wire nails about 2 inches long and solder a copper burr to the head of each one. Gather up the papers in rotation according to date from January to June inclusive, and drive these nails at a point $4\frac{1}{2}$ inches from each end and $\frac{1}{2}$ inch in from the back edge right through the whole bundle. Now cut off the points that project through, and solder on burrs to correspond with the opposite side. Measure the thickness of the volume, and cut out a piece of tin like the cut, leaving 1 inch outside the lines *a* and *b*. Cut out three notches, as shown, each 2 inches long, which will form hinges for the covers to turn on, and wire with No. 12 wire. Bend at right angles on the lines *a* and *b*, which represent the thickness of the volume. Put this on the back of the book, and 2 inches from each end drive a nail through and solder on a burr as before, only having the burrs outside the metal cover this time. This will securely fasten the cover to the book. All that remains to do now is to cut out two pieces for the back and front of cover. Fold them on four sides and solder on to the hinges, and you will have a volume which has cost you about ten cents

for material and is neat in appearance and very useful. You can obtain from *The Metal Worker* office an index for each volume, which will make it easy for reference.

Water Hammer in Pipes.

From G. A. L., Manchester, Vt.—What effect will the closing of a fire hydrant quickly have on the plumbing fixtures in a house when the water supply is taken from the main and the range boiler has no relief valve? Would it not cause the boiler to leak or some of the other fixtures to burst, the water pressure being from 100 to 125 pounds? If any readers of *The Metal Worker* have had trouble of this sort I shall be glad to hear from them.

From G. J. M., Oshkosh, Wis.—I have done a job of plumbing in a house where the authorities required the use of self closing work. Now, when they draw water at the sink and let go of the faucet it pounds over all the house. Another trouble is that the ball cocks drop and splash the water out of the flush tanks. There are no air chambers in any part of the house and we cannot very well put them on the closet supply, neither would it be convenient to place them at the sink. Would it remedy the trouble if the air chamber was put in the cellar, or what would be the best thing to do under the circumstances? Please tell me what would make the best air chamber, what size to use and all about it.

Automatic Damper Regulator.

From M. F. I., Canada.—Will any of the readers of *The Metal Worker* inform me if there is any automatic device for regulating hot air dampers from the ground floor? If so, where is the device made?

High Pressure Water Heating.

From C. C. S., Woodbury, N. J.—Please inform me what is meant by high pressure water heating and what is meant by low pressure hot water heating.

Answer.—On all hot water heating systems an expansion tank is located at some point to receive the excess of water in the heating plant due to expansion when it is heated. In low pressure heating this expansion tank is open to the atmosphere, and no attempt is made to confine the water under pressure. In high pressure heating the expansion tank is hermetically sealed, leaving a space equal to one-twelfth of the bulk of water in the system for air in the tank above the water line in the system when the water is cold. When the water expands the air acts as a cushion and the pressure is proportional to the amount of space left in the air chamber, a small air space resulting in a high pressure and the pressure being reduced as the air space is enlarged. On such system a safety valve is always placed on the expansion tank at the top of the air chamber to permit the escape of air or water after the pressure has reached a given point. Some experience and skill is required in adjusting the pressure hot water heating system correctly,

and the use of such systems is very small compared to what is known as open tank or low pressure system. In case of the safety valve being weighted too heavily or becoming stuck to the seat, higher pressure is liable to be developed in the system than was intended, and in some cases the system has burst with considerable force and damage. On the liberation of water heated to a temperature considerably above 212°, owing to the pressure the water immediately turns into steam. Experienced men prefer the open tank or low pressure heating.

Radiating and Heating Surfaces.

From F. F. G., Belvidere, Ill.—How many square feet of radiating surface will 1 square foot of heating surface supply?

Answer.—The following extract from Baldwin's "Steam Heating for Buildings" indicates the difficulty of answering the question exactly: "There is no simple relation between the heating surfaces of boilers and the radiating surfaces of the buildings they have to supply the steam to, for the following considerations apply to every type of boiler: The method of setting, what the grate surface is, the character of the work they are designed for, and whether the air is simply to be maintained at a certain temperature, as in direct radiation, or whether every cubic foot of air which comes in contact with the radiator must be warmed from the outside temperature, as in indirect radiation, or whether the apparatus is direct-indirect or composite, all of which would have to be considered, and the results would then only be approximate; for even then, neglect of cleaning, a certain amount of neglect of management, and the state of the fire—whether on the first hour of the new fire, or the last hour of the dirty fire, for the time they are to run, must enter into this calculation.

"If the effect of the cooling produced by loss through the glass and walls of a building can be estimated and added to the amount of heat lost in warming the air admitted for ventilation, a close estimate can be made of the smallest grate which would burn fuel enough to evaporate the amount of water in a boiler sufficiently large; but the following points the constructor must never lose sight of in estimating for an automatically fitted boiler—namely, that it is the amount of opening in the draft door which regulates the fuel burned; next, the fuel burned regulates the water evaporated; and, finally, the water evaporated regulates the heat—both the heat of the room (by having a sufficiently large heater) and the heat (or pressure) necessary to move the diaphragm—which regulates the draft, so that really what is required are certain limits within which he knows he is

safe and to exceed which would be an unnecessary expense.

"Boilers for very large buildings, which have an engineer in charge, may be figured pretty closely; as he is supposed to be constantly at his post, and to clean his boiler fires regularly, and to fire often, and in small quantities, keeping his fire door open the shortest time possible, and further, to clean the tubes or flues whenever required. But this is not the case in house boilers. They must run for long periods without cleaning or inspection, and be adequate to every contingency of change within their limit of time to keep steam. It has been found by experiment in a general way, and from practice, that for ordinary buildings with average window surface and for the greatest range of temperature in our Northern States, when nothing but direct radiation with no ventilation is used, 1 square foot of boiler surface to 10 square feet of radiating surface will answer; assuming the radiating surface is ample. For indirect radiation, if the heating or radiating surfaces of the coils are figured double what they would be for direct radiation without ventilation, the same proportion of boiler to coil will suffice; but if, instead of doubling, the same surface be used or a slight increase, as one-fourth or one-third, and the building be kept warm by moving the air faster through a small coil, we must proportion the boiler the same as if we did double—that is, allow 1 square foot of boiler surface to 5 square feet of coil surface, the same as figured for direct radiation, bearing in mind, a boiler is proportioned to the cooling which goes on—heating, ventilating, &c.—and not to the coil surface, unless the coil surface is known to be ample for the conditions of temperature, &c.

"When the air is forced (as with a fan) more heat can be taken from a coil in the same time than when the air moves naturally from a difference in temperature, but as the heat necessary for the building remains the same the boiler must be proportioned to the building, and when the proper coil surface has been found sufficient to maintain the heat for the range in temperature incidental to the climate and local conditions, it establishes the simplest data from which to calculate the boiler. For direct-indirect radiation, proportion the boiler one and one-half times greater than it would be for direct radiation. These estimates are for boilers with ordinary high combustion, such as horizontal boilers, which are kept clean without interruption, but for house boilers (wrought iron shell), with slower combustion, an addition of from one-eighth to one-fourth may be used, and in small water tube boilers (pipe boilers) one-fourth to one-half may be added, in the judgment of the fitter."

The following extract is from Hood, on "Warning Buildings by Hot Water:"
"It is obvious that the extent of surface

which a boiler ought to expose to the fire should be proportional to the quantity of pipe that is required to be heated by it, and it is not difficult to estimate these relative proportions with sufficient accuracy, notwithstanding the various circumstances which modify the effect. It has been proved by experiments that 4 square feet of surface of an iron boiler will evaporate 1 cubic foot of water per hour, when exposed to the direct action of a tolerably strong fire. This, however, requires free exposure to the radiant heat of the fire; for the heat communicated to the flue surfaces is only equal to one-third of that which is derived by the direct action of the fire acting upon the bottom or sides of the boiler. And it can be ascertained by calculation that the same extent of heating surface which will evaporate 1 cubic foot of water per hour from the mean temperature of 52°, will be sufficient to supply the requisite heat to 232 feet of pipe 4 inches in diameter when the temperature of this pipe is to be kept at 140° above that of the surrounding air. From this, then, it appears that 1 square foot of boiler surface exposed to the direct action of the fire, or 3 square feet of flue surface, will be sufficient in a hot water apparatus to supply the necessary heat to about 53 superficial feet of pipe, or in round numbers, the proportion may be stated as 1 foot of boiler to 50 feet of pipe. As this, however, is almost the maximum quantity of pipe which can be heated, or, in other words, the maximum effect which can be produced without mechanical means of producing draft, it is very desirable in all cases to allow an increased surface of the boiler, bearing in mind that not only will economy of fuel be thereby produced, but the apparatus will be much easier managed and thus become more effectual and certain in operation.

"A small apparatus ought always to have more surface of boiler, in proportion to the length of pipe, than a larger one; as the fire is less intense, and burns to less advantage in a small than in a larger furnace. The effect also depends greatly upon the quality of the coal, the height of the chimney, the rapidity of draft, the construction of the furnace, and many other particulars; and it will always be found more economical, as regards the consumption of fuel, to work with a larger surface of boiler at a moderate heat, than to keep the boiler at its maximum temperature. A useful formula for calculating the effect of boilers and furnaces in most common cases is as follows: One square foot of boiler surface exposed to the direct action of the fire will boil 11 gallons of water from 52° to 212° F. per hour; or, in other words, it will add 160° of heat to 11 gallons of water. Or the same surface will evaporate 1½ gallons of water per hour. The area of the furnace bars should be about one-sixth that of the boiler surface."

Question of Gas Pressure.

From G. W. FERRIS, *South Manchester, Conn.*—In *The Metal Worker* of February 2 I notice the item from "G. E. S.," Pennsylvania, complaining of trouble with gas pipe in cold weather. The same trouble was experienced here with a 6-inch pipe which crossed a bridge about 6 feet below the line of the bridge floor. In very cold weather the pressure was greatly diminished, so much so that my gas stove in the shop would not work properly. This year the company have covered the pipe and I think they use a cow hair composition, and notwithstanding the recent severe weather we have had no trouble this year.

Inside Cold Air Duct.

From EREC, *Spencer, Ill.*—B. Røse, Odessa, seems to be a good writer on tinner's matters, and the writer would like him to give his experience on the use of inside air ducts—I mean taking air from the halls to supply a furnace with cold air. Should the inside cold air duct be equal to the area of the heating pipes, or should the accustomed three-fourths of the outlet be used for the supply pipe in such cases? Does it make any difference whether the air duct is run down close alongside of the furnace or should it be run underground a considerable distance before reaching the furnace? In a word, what is the best known plan to follow in using a cold air supply from hall?

What Is a Vacuum?

From P. J. R., *Connecticut*.—Noticing the very many valuable explanations you have given in the Letter Box, I would like to have you help me by giving an explanation of the word "vacuum." I know that siphonage results from a vacuum or partial vacuum being formed in the waste pipe beyond the trap, and that every time a fixture is emptied there is a certain amount of air displaced which must find its way out of the pipe through either the vent or, if not vented, through the weak seal of the other traps on the line, and I have noticed that on a long line of waste pipe there seems to be a strong suction after a fixture has been emptied which will cause the water to be drawn out of the trap when not relieved by a vent pipe, but still I am not able to explain what a vacuum is. I have an idea of what it is, but do not know how to express myself. Will you kindly inform me what the proper explanation of the word may be?

Answer.—A vacuum is merely a space where there is nothing. That is the dictionary definition, but as used in everyday talk and in reference to sanitary matters, it refers to a space from which the air has been exhausted to a greater or less degree. When this occurs in pipes there is a tendency for the water adjacent to this space to rush in and fill it on account of the pressure of the external air. Nature always endeavors to establish an equilibrium of pressure, and it is because of this law that we are able to make use of the suction pump, that device illustrating what a vacuum is and how its presence operates. In raising the plunger of a pump the air in the pump chamber is

exhausted and a vacuum formed, or, strictly speaking, a partial vacuum. The result is that the normal air pressure on the water forces it up to fill this chamber and so establish equilibrium. A repetition of this process enables us to raise water. An absolute vacuum is a space from which the air has been completely exhausted or expelled. A partial vacuum means that the air has only been partly exhausted, and the result is that the pressure there is lessened to a greater or less degree. In an absolute vacuum the pressure gauge would fall $14\frac{7}{8}$ pounds, as compared with the record in the atmosphere.

A Peculiar Furnace Experience.

From E. E. PALMER, Harrisburg.—In *The Metal Worker* of the 9th I noticed an article "A Peculiar Furnace Experience," and became interested in it and also your reply. Please allow me to offer the following as cause for the "peculiar experience." The room from which the attempt is made to draw cold air to the furnace is already supplied with means for the escape of the air in the room, and more besides, and it is the strong draft in the fire place flue that causes the cold air pipe to have the contrary movement of air in it. The amount of air carried out of the room through this flue is probably in excess of the amount delivered through the warm air register, and the cold air pipe is simply acting as a supply pipe which allows enough air to come into the room to supply the demand of the fire place flue. The cold air currents which were objectionable might have been caused in one of two ways. The fire place acting as a ventilator for the whole house drew all the cold air on the floors toward it, or, if the room was kept closed during cold weather, the warm air register could not deliver air enough to supply the fire place flue, consequently every crack and crevice around doors and windows admitted air, which, entering the room, would be drawn directly to the fire place flue and cause cold currents on the floor of the room. I believe the fire place to be the cause of the back action in this case, and while it is admitted that the fire place is a good ventilator, many times they ventilate too much, and it becomes necessary to partly close them up with summer pieces or in some other way so that the outlet will not be so great. The opening to many of them is from 3 to $3\frac{1}{2}$ feet above the floor, and I have known of cases where it was impossible to warm a room until the opening had been reduced and the cold air drawn off at the floor.

From R. S., Brooklyn.—I notice the letter from "C. S.," Cleveland, Ohio, in *The Metal Worker* of March 9. If "C. S.," and all other furnacemen would imagine a house was submerged in water they would have less trouble in solving their heating problems. The pressure throughout all parts is equal until the heat is applied by the furnace, which makes the air lighter. There is an unlimited supply of cold air to enter the furnace, and when the air is heated it will rise. When an exhaust pipe is taken from a room to the base of the heater a circulation should

follow unless the heat makes it escape through some other channel. In the case reported there seems to have been no circulation of air, but an ample supply of air forces heated air up what should be the return pipe of the circulating system. This shows that there is a faucet open on the system somewhere, and until this faucet is closed circulation will not exist. I will suggest to him to hunt for this faucet and close it. If the fire place shown on his sketch is open in all probability he will find that it is the faucet.

Collapsed With a Vacuum Valve.

From M. A. C., Petoskey, Mich.—Recently we had a 30 gallon copper boiler collapse, and are at a loss to know what caused it. The boiler was connected with a range in the usual manner. On top of the boiler in the supply pipe was a $\frac{3}{4}$ inch vacuum valve, the supply pipe continuing down into the boiler with a hole in the delivery pipe near the top. We get our water supply from a reservoir located on a hill. The water is pumped through the mains to the reservoir, and at the pumping station there is a pressure of 120 pounds. When the water becomes dirty they close the valve near the reservoir and open one near the pumping station, drawing all the water out of the main. The boiler collapsed while drawing the water out of the main. The vacuum valve was in good condition when I examined it soon after the boiler collapsed, and was not stuck fast with sediment. There is about 40 pounds pressure on the boiler when in use, and the water is carried direct from the main to the boiler. I should like to know what caused the collapse and what will prevent it in the future.

Note.—If the vacuum valve was loose and in working order, it probably became so through the jar and shock of the collapse. Had it opened when the tendency toward a vacuum occurred, air would have rushed in and the collapse would have been prevented. If our readers can give any light on this subject we shall be glad to hear from them.

Paste for Asbestos Paper.

From W. H., Indiana, Pa.—In *The Metal Worker* of March 2 I see an inquiry from J. Callahan & Sons of Cleveland, who want a paste for putting asbestos paper on hot air pipes. If he takes his paper and soaks it with water and puts it on the pipes with plenty of lap, it will stay there. It also can be put on steam pipes in this way with excellent results.

From J. R. L., Binghamton, N. Y.—In reply to the inquiry in *The Metal Worker* of March 2 respecting paste for asbestos, would say that I have found the best method to stick asbestos on heater pipes is to lay the paper on flat and rub with the hand until a paste is formed of the asbestos. I found that simply wetting did not make it stick sufficiently.

Wants to Stop a Gas Leak.

From J. M., Greenville, Ind.—Is there any known way of stopping a line of gas pipe from leaking which is inclosed in a partition and under floor without taking it out?

A Question in Furnace Construction.

From CONTACTOR, United States.—I don't mind opening up on "Contention," having read his letter in *The Metal Worker* of February 23. In the first place he is wrong, like the whole furnace trade, in calling the upper section of his furnace a radiator, because air does not heat appreciably by radiation. If it did not radiate any more than an iceberg, but still kept hot, it would snare just as good a purpose in a furnace. Air is heated by being brought into contact with a hot surface, and then passes along and heats other cool air by mixing with it. Consequently, a more sensible name for the internals of a furnace would be "Contactor." Now, the United States having got into contact with Canada, I will proceed with the contention. As air is heated by contact I am strongly in favor of a space between the fire pot and the contactor. If the contactor is cast as a part of the ash pit air cannot pass up on the inner side, hence that surface of the contactor is lost, and also that of the fire pot. If the space between the contactor and the casing is too great the air current passing will not be heated on its outer side. I was talking only yesterday with a bright and successful furnaceman who sets furnaces in three States, and he incidentally remarked that he had used all kinds of furnaces, but got the best results from a style he pointed out. It had a cast iron central dome surrounded by a circular steel contactor. He calculated that he got a large amount of hot air from the space inside of the contactor. Take a 40 inch casing and put a 32 inch solid top contactor in it, and the area of the air space will be about 450 inches. Now make the contactor of the two-cylinder type, making the inner cylinder 24 inches in diameter surrounding an 18 inch dome. They will make first class heating surfaces and the construction will give an air space of 200 inches in area. The air from this space will be hotter than the other air and will increase the capacity of the furnace at least one-third. Have an air space by all means, "Contention," and arrange your contactors to make them available. If you want your contactor to be a radiator, arrange a circular sheet iron contactor to surround it. This contactor should reach from the middle of the fire pot to the top of the radiator-contactor, then by absorbing radiant heat and being hot on both sides it will split the air currents, and doing double duty as a secondary contactor it will prove almost as efficient as a primary contactor.

Which is the Best for Furnace Tops?

From T. O. M., Adams, N. Y.—Replying to the inquiry of "J. C.," Cleveland, that appeared in *The Metal Worker* of March 2, would say that I think he will be obliged to look somewhere else for the difficulty with his furnace work. Taking the hot air pipes from the top of the hood is considered good form in this cold country where there is room to do so and still give the pipes free pitch from the furnace to the registers. Let him take a good, thorough look all around and see if he does not find some other cause for the trouble. Especially let him see if there is any way of taking the cold air out of the rooms into which he wishes to introduce hot air.

STEAM AND HOT WATER.

The Steam Fitters' Convention.

A letter has been received by *The Metal Worker* from J. Leland Wells, chairman of the Executive Committee of the Master Steam and Hot Water Fitters' Association of the United States, stating that the seventh annual convention of the association will be held in Philadelphia on June 13, 14 and 15. This is the same week that the National Association of Master Plumbers hold their convention, and is to enable those who are interested in both associations to attend both conventions.

The Carton Boilers.

The Carton Furnace Company, Utica, N. Y., have brought out a line of Carton safety sectional steam and hot water boilers which the trade will be interested in reading about. The illustrations presented herewith show very completely the construction of the Carton steam boiler. The hot water boiler is of the same general appearance without the steam trimmings; the description, therefore, will suffice for both. In designing the apparatus it was made so that the products of combustion would, it is claimed, impinge positively upon over 90 per cent. of the surface, nearly all the surface being horizontal, while

tion at any pressure. Fig. 1 shows the Carton steam boiler with side cut away, revealing the flue arrangement and

box, which give easy access to the smoke flues, so as to permit their thorough cleaning from the front of the

Fig. 2.—View of Sections.

showing the course of the products of combustion. The boiler is made in portable form and can be set in brick if

boiler. In Fig. 2 is shown an intermediate section, the water back section and smoke drum which forms the diverging flue. A recess is shown on the water back section, forming a flue through which the smoke and gases rise before traveling through the lower smoke ports to the front of the boiler, where they again rise and travel to the rear of the boiler through the top smoke ports, where the fuel products may be taken direct to the chimney through the upper smoke collar or carried to the bottom of the smoke drum through the return flue to the chimney. The cut shows the horizontal boiler surface and the double corrugations in the fire box and water back. Fig. 3 is a view of the intermediate section of the boiler, showing more clearly the water ways and water line, while Fig. 4 is a back section of the boiler. It is mentioned that the vertical curved water ways in the steam space directly above the water line act as relief ports and prevent any foaming of the boiler and allow the steam to pass off perfectly dry. In Fig. 5 is presented a view of the grate used in the Carton steam boiler. It is the Smyth duplex, and can be easily shaken and dumped. It is operated by a lever bar in front, and in case repairs are at any time necessary any grate bar can be removed through the feed door without disturbing the entire grate. The steam boilers are made in eight sizes, with fire chamber measuring from 15 x 20 inches to 57 x 20 inches, and adapted to heat with covered mains from 393 to 1264 square feet of direct radiation. The hot water boilers of similar size are adapted to supply with covered mains from 750 to 2500 square feet of direct radiation. Tables furnished by the Carton Furnace Company give likewise the rating of the

The Carton Boilers.—Fig. 1.—Broken View of Steam Boiler.

the circulation of water is vertical. Especial care was taken in arranging and proportioning the water and steam passages so as to assure perfect circula-

desired. All joints are screwed and are on the outside of the boiler, where they can be easily reached. Attention is directed to the large doors over the fire

Carton boilers for greenhouse and conservatory heating. William J. Baldwin, the well-known heating engineer, has made an exhaustive test of the boiler, and the report, which is as follows, will be read with interest in connection with the description:

The boiler was composed of a front, three vertical intermediate sections forming a fire box, and a back section. The sections were connected at their lower outside extremities by 2 inch lock nut nipples with return pipe headers, and at their top centers, in like manner, with a steam header. The grate area was 20 x 21 inches, and the grate was of a rocking pattern. The fire box is formed by a fire brick lined front. The three intermediate sections and one back section were corrugated in two directions, a large corrugation being formed in one direction, while across the large corrugation, in the other direction, was formed a smaller corrugation, the whole of which presented a large heating surface, in direct opposition to the fire. The general arrangement of the boiler provided for taking the products of combustion backward over the fire, thence upward and forward through one set of flues, and returning it again to the rear by a set of passages formed in the castings and above those already mentioned. As the boiler is intended as a house heating boiler, either as a steam or as a hot water boiler, and as it was more convenient to make the trials as a steam boiler, the boiler was set up to simulate actual conditions of low pressure steam heating. The boiler was connected with an ordinary chimney of about 35 feet in height, with natural draft and slow combustion. The trials were made at a steam pressure of 5 pounds, and cold water was fed into the boiler at a temperature of 52° F.

per pound of combustible—the ashes and clinkers having been weighed back—was 10.07 pounds of water from 52° F. to 5 pounds pressure of steam. The equivalent evaporation per pound of coal from water at 212° F. to 5 pounds pressure of steam is 10.2 pounds of water.

combustible burned per square foot of grate per hour was 4.76 pounds. The amount of water evaporated from 52° F. to 5 pounds steam pressure per square foot of average boiler surface per hour was 2.17 pounds. The equivalent evaporation of water from 212° F.

Fig. 5.—Grate.

The equivalent evaporation, therefore, from the temperature of the return water, in a gravity apparatus, to low pressure steam is approximately 10

to 5 pounds steam pressure, per square foot of average boiler surface per hour, is 2.368 pounds of water. Calorimeter tests of the quality of the steam were made from time to time which showed that the steam was practically at maximum density, or in other words, the steam was dry.

The rating of the No. 4 boiler above described and tested is 640 square feet of radiation for house heating by steam when the pressure is low (say 1 to 5 pounds). The above calculation of heating surface is based on the use of 5 pounds of coal per square foot of grate, and forms the maximum condition for a house heating boiler. You will note that when the rate of combustion is equal to 5 pounds of good anthracite coal per square foot of grate per hour 1 square foot of average boiler surface evaporated sufficient steam for 10 square feet average radiation, an exceedingly high efficiency and rarely obtained in practice. The low temperature at which the gases of combustion entered the chimney, ranging from 3° to 21° above the temperature of the steam, shows that the boiler utilizes about all the available heat of the fuel.

Fig. 3.—Intermediate Section.

Fig. 4.—Back Section.

The temperature of the flue gases as they passed through a short smoke pipe ranged from 230° F. to 248° F. during the trials. The evaporation of water from 52° F. to 5 pounds pressure of steam was 9.32 pounds of water per pound of dry coal. The evaporation

pounds of water per pound of coal. The equivalent evaporation per pound of combustible from water at 212° F. to 5 pounds pressure of steam is 11.02 pounds of water. The amount of coal burned per square foot of grate per hour was 5.14 pounds. The amount of

THE HAYDENVILLE MFG COMPANY, 73 Beekman street, New York, have issued a compactly arranged catalogue of 372 pages, devoted to Brass and Iron Valves and Cocks for steam, gas, water, oil and chemicals; also Engine, Pump and Ship Builders' and Machinists' Supplies and Tools and Plumbers' Material. Among the goods of which the company make a specialty, under the common name of Haydenville, are included Finished Lavatory Valves, Gas Log Valves, Needle Valves, Disk Globe Valves extra heavy, Quick Opening Hot Water Radiator Valves, Fire Hose Valves, Double Gate Valves, Throttle Valves, Packed Plug Steam Cock and Bayonet Top Oil

Cups. In addition to the foregoing a specialty is also made of Steam Pressure Regulators, Elevator Regulating Valves, Vanwie's Swing Check Valves; Engine, Globe and Angle Valves and Cushman's Steam and Water Vaporizers. The catalogue is miniature in size, measuring about 4 x 6 inches, and is fully illustrated, with prices.

A Circuit Hot Water Job.

From L. E. St. Louis.—Knowing that all the editor of *The Metal Worker* has to do is to answer the questions that are put to him these hard times and dull days, and having nothing to do myself, I ask a few questions, just to keep the editor busy and also, perhaps, gain some information. I wish to know what rule is used to calculate the number of feet of radiation that different sizes of pipe will carry in hot water systems. If there is no rule please state how many feet of radiation in ordinary house heating can be carried by 1, 1½, 2, 2½ and 3 inch pipes. In all of the shops in which I have worked different ways of figuring are used and every "boss" claims to know it all and that the other fellow does not know what he is talking about. I am looking over a set of plans this evening in which the architect specifies a single 3 inch circuit main to be used for both flow and return. The flow pipes to the radiators are to be taken from the top of the main and the return pipes to be connected at the side of the main, thereby forming two currents of water in pipe. The architect says (and of course he knows it all) that he has one heating plant of this kind in operation at St. Louis giving perfect satisfaction. There will be 745 square feet of radiation in the plant, and what is a mystery to me is how two currents of water can be formed in one pipe. I have an idea that it is done in the same way that two trains moving in opposite directions pass on a single track. I would like to hear from some of the practical hot water readers upon this subject. The sketch shows the heating plant, which is to be put in on the one-pipe system with the highest point in the circuit main at A.

Note.—In *The Metal Worker*, October 20, 1894, a circuit system of hot water piping was shown in a combination plant, and on March 2, 1895, the lecture on hot water heating by James Mackay gives information on running circuit mains and the capacity of pipes to carry radiation. Sometimes the area of a 1-inch pipe is considered sufficient for 100 feet of radiation, but under low temperatures of water and long runs or exposed pipe, an area of 1 square inch is better and seems to have been used in determining the size of the circuit main in the plant mentioned. All rules in reference to heating increase in value with the excellence of the judgment with which they are applied, hence the sizes of pipes mentioned will carry the following approximate radiation: A 1-inch pipe, 75 feet; 1½-inch pipe, 150 feet; 2-inch pipe, 225 feet; 2½ inch pipe, 350 feet; 3 inch pipe, 475 feet, and a 3 inch pipe 750 feet. With the increase in diameter of a pipe there is a decrease in the surface to lose heat in proportion to the bulk of water carried, so that many fitters use more radiation

than is given above. In reference to the plan submitted it is quite probable that the architect has employed some expert heating man to make the plan and specification, as that is a growing custom, and it is possible that as the architect has confidence in his advice he will insist on the letter of the specification and consequently is hardly open to criticism. In the opinion of some successful men it would be wrong to make the high point in the circuit main at A. It should be highest at the boiler and have a fall throughout its entire length until it returns to the boiler of 1 inch in 8 feet, then at the boiler it may drop down and connect at the bottom. In circuit mains the size should be ample—that is, one size

A Circuit Hot Water Job.

larger than would be used on a two-pipe system—in order that the supply of hot water be sufficient to reach the farthest radiator without being greatly chilled by the return water from the intervening radiators. There will never be two currents of water in the pipe if properly run, as the cooler water will fall to the boiler and the hotter water will continue to lose heat and fall as soon as it leaves the high point at the boiler. There may be a sufficient difference in the temperature of the water in the pipe to show very plainly, and it is possible that the colder water will fall or flow freely toward the boiler. Under some conditions it might be possible for the colder water to hold the hotter water in check before reaching some radiator, and by this means interfere with the radiator being heated. The opinions and criticisms of our readers have been invited by our correspondent.

ON WEDNESDAY MORNING a fire broke out in the building of Gillis & Geoghegan, 33 and 35 South Fifth avenue, New York, which entirely destroyed the building and their stock and tools as manufacturing and contracting steam fitters. Their loss is reported to be \$75,000, on which there is insurance to the amount of \$66,000. Nikola Tesla, the electrician, occupied the fourth story of the building as an experimental laboratory. The cause of the fire has not been traced.

HEATING NOTES.

THE EATON, COLE & BURNHAM COMPANY, manufacturers of Water, Steam and Gas Fittings, now at 61 Beekman street, New York, are about to move into the Postal Telegraph Building, at Broadway and Murray street. They will have a commodious suite of offices on the fourth floor overlooking Broadway. The secretary, Wm. H. Douglas, in alluding to the new departure said it might be thought to require some courage to do this, but they had found their goods were more and more going into the Hardware trade and this would put them in Hardware territory. This location is a very convenient one, and the company will be in possession of more room than was obtainable in their present quarters.

A DEFECT in the heating apparatus in the Universalist church, says a Watertown local paper, lowered the temperature below 45° Sunday morning, and it was very cold in the building. Rev. Libbey humorously insinuated that he was a staunch Universalist, but that a little fire wouldn't go bad at all just at that time.

THE H B SMITH COMPANY, 133-137 Centre street, New York, favor us with pocket maps of the States of New York and New Jersey. The front cover proclaims the company manufacturers of steam and hot water heating apparatus for warming all classes of buildings. The back cover shows a cut of their popular Cottage boiler and a list of their boilers, the Mercer, Gold, Mills and Cottage, also their radiators, the Union, Royal Union, Imperial Union, Champion Union, Reed and Whittier direct radiators and the Gold indirect pin radiator. If the maps showed the location of their goods throughout these States, the towns, rivers and railroads would be lost to view.

THE ACME BOILER & RADIATOR COMPANY of St. Paul, Minn., have filed a certificate of amended articles, changing the name of the corporation to the Universal Heating Company.

A LONDON, ENGLAND, EXCHANGE says: "The Lyceum was the first theater in the world to be lit by gas. This was in 1803; but as the audience complained of the odor it was soon discontinued. Now the Vaudeville Theater has won the place of honor as being the first place of entertainment in England to be heated throughout by electricity."

THE AMERICAN BOILER COMPANY will be represented in the State of Iowa by E. C. Molby, who takes the place formerly occupied by J. T. Ryan.

AT A MEETING of the Board of Managers of the American Society of Heating and Ventilating Engineers held last Monday, B. F. Slangland was appointed chairman of a committee to secure designs for a badge for the society. It was also decided that the board would hold regular meetings at 2 o'clock in the afternoon on the first Monday of each month. A regular date for these meetings was set, so that those who have business which they would like brought before the society may forward their communications to P. O. Box 1818, New York City, prior to that date.

SERRILL & SCIENCE, 39 Cortlandt street, New York, agents for the Webster exhaust feed water heater, are equipping the paper mill of F. S. Field & Co. of Boonton, N. J., with a large size Webster vacuum feed water heater. This will be connected with the dryers.

some of which are 4 feet in diameter and 8 feet in length, steam being admitted to the dryer through the journals on one side and the condensation being exhausted through the journal on the opposite side. It is said that with their system sufficient vacuum is formed to lift the water from the bottom of the dryer through a pipe which reaches nearly to the bottom to withdraw nearly all the water from the dryer. In the past it has been the custom to stop the machinery as frequently as it became necessary, and bleed the dryers of the water which had accumulated by means of a cock. A very material saving is said to be effected by returning this condensation to a hot well, from which it is pumped to the boiler.

CHAS. GORTON of the Gorton & Lidgerwood Company, 96 Liberty street, New York, recently returned from a trip among the steam and hot water heating trade in New England, and reports that the Gorton boiler, both for steam and hot water, has acquitted itself to the satisfaction of all users during the recent cold spell.

HIGGINS & Co, 379 Lexington avenue, New York, are distributing among their patrons a small mirror, on the back of which is their address and the Richmond trademark in blue, and the words "Victor steam and hot water heaters" around the outer edge in white letters on a red ground.

EDWARD GURNEY of the Gurney Hot Water Heater Company, Toronto, Can., was a visitor last week at the office of Johnson & Co., 71 John street, New York, who are agents for the Gurney steam and hot water heaters in New York.

ON FEBRUARY 18 P. K. Dealy gave "a plain talk" before the Chicago Steam Fitters' Protective Association on the Williams vacuum system of steam heating. This system is an arrangement of apparatus for drawing the steam and condensation from the piping by suction instead of forcing the circulation by pressure. Exhaust steam is utilized without back pressure on the engine, so that the cost of both power and heat is said to be no greater than the cost of power alone; and when used with appliances in which live steam only is available for heating at high pressure, it is said to be almost equally valuable. It is claimed that with this system better heating has been had with a pressure of 24 pounds at the boiler than has been previously secured from the same piping under a pressure of 80 pounds.

THE NIAGARA RADIATOR COMPANY of Buffalo, N. Y., are distributing very artistic hangers, illustrating the Niagara radiator. The hanger is composed of heavy cardboard, eyeleted at the top for hanging on the wall. The company are also issuing cards giving all dimensions of the various sizes they manufacture. Their radiating surface is rated as follows: 38 inches high, 7 square feet per loop; 32 inches, 6 square feet; 27 inches, 5 square feet; 21 inches, 4 square feet.

JAMES A. HARDING, whose address is Vineyard Haven, Mass., has severed his connection with the Paul Steam System Company of Boston.

According to an estimate based on actual traffic returns, the *Railway Age* computes that the railroads of the United States paid in wages and other operating expenses \$100,000,000 less in 1894 than they did in the previous year.

HEATING & PLUMBING.

NEW WORK AND CONTRACTS.

THE CHARLES H. SIMMONS COMPANY, 72 Market street, Chicago, are to install steam heating plants in the store building of Heywood & Morrill, 272 Wabash avenue, and in the flat building of Perley Hale, 6833 Prairie avenue.

COOK & CHICK, 253 and 255 Kinzie street, Chicago, have the contract for steam heating in the flat building of Dr. Peter Fahrney, 938 and 940 Park avenue.

DURING FEBRUARY the hot water and steam heaters made by the J. H. McLain Company of Canton, Ohio, whose Chicago office is at 58 Dearborn street, were installed in the following buildings in Chicago alone: Two heaters, Newburs Building, 431 East Forty-sixth street; residence J. H. Neill, 4225 Drexel Boulevard; residence W. H. Mahnk, 4227 Calumet avenue; residence John Ott, 630 North Roby street; two heaters residence Jos. Cormac, 680 Ione place; residence S. Mayer, Drexel Boulevard and Forty-third street; residence M. Blocki, Forty-third street; residence S. H. Rosenthal, Indiana avenue; two heaters residence Geo. A. McClelland, Kenilworth; residence Dr. Matteson, 4934 Vincennes avenue. In addition to these they report sold but not yet delivered six Cambridge steam heaters for the flats erected by W. H. Sear at Sixty second street and Calumet avenue, and steam heaters for the new and handsome Partridge residence on the South Side. Country trade has been very good also with them. These sales do not include their business in their Oxford perfect blast furnace, which, all over the country, has exceeded their expectations for trade so early in the season.

IN GEORGE W. SCHLICHTING'S residence the heating and plumbing were done by Joseph Dugdale, Bridgeport, Conn. The former is known as the siphon hot water system, which works satisfactory. He also has the plumbing contract for Dr. E. T. Payne's new block and two stores and apartments.

H. C. HURLEY, representing the Buffalo Forge Company, Buffalo, N. Y., has completed the heating and ventilating plant in the Ninth Ward School at Rutland, Vt.

A. W. HUNTER, North Adams, Mass., is putting hot water heating apparatus into Dr. W. E. Brown & Son's new sanatorium. Two Perfect boilers are used and there will be 131 radiators in the building.

FREDERICK SCHOLEFIELD, 310 South California avenue, Chicago, is to do the plumbing and drainage in the flat building of E. W. Schan, 1281 Bonney avenue.

PAUL H. JAESCHKE, 72 Centre street, Chicago, has the contract for the plumbing and drainage in the residence of Paul and Albert Dennis, Warren avenue, near Crawford.

PORTER & KLEIN, 100 Thirty ninth street, Chicago, have the contract for the plumbing and drainage in the store building of E. Rice, Forty-seventh street, near Union.

ELLIOTT & RYAN, 272 Fifty-fifth street, Chicago, have the contract for the plumbing and drainage in the building of J. K. Flood, Madison avenue, near Sixty-second street.

BINDER BROS., 132 Lake street, Chicago, have the contract for the plumbing and drainage in the flat building of O. Forgerson, 269 North Robey street.

THE J. W. BROWN PLUMBING COMPANY, 364 Lincoln avenue, Chicago, are to do the plumbing and drainage work in the residence of C. A. Hull, Greenleaf and Grand avenues.

CHARLES C. BREYER, 187 West Division street, Chicago, is to do the plumbing and drainage in the four cottages of W. H. Giesecke, 901 to 907 Elk Grove avenue.

ALEXANDER M. MAYPOLE, 816 West Van Buren street, Chicago, has the contract for the plumbing and drainage in the flat building of J. D. Thompson, 1175 West Monroe street.

T. W. CORBETT, New Haven, Conn., has nearly completed the plumbing of the new Gay apartment building. There are 50 water closets, 46 porcelain lined bathtubs, all with exposed nickel fixtures. J. H. McCormack of Wallingford is putting in a McCormack steam boiler and the H. B. Smith Company's Gold radiators.

ARCHITECT JACKSON has awarded to the Barlow Bros. Company, Waterbury, Conn., the contract for plumbing the alterations to Peter Brooks' house.

THE VANDERMAN PLUMBING & HEATING COMPANY of Willimantic, Conn., have been awarded the contract for piping the new shoe factory at Colchester.

THE EQUATOR STEAM BOILER, made by the Nason Mfg. Company, 71 Beekman street, New York, will be used in heating a five story apartment house for A. Taylor, Brooklyn, and two apartment houses for the Estate of B. A. Ayerig, on Thirty-third street, New York.

MULHERN & PIATTI, 44 East Forty-second street, New York, are installing the heating plant in the fire engine house at White and Elm streets, New York, and in an office building at 89 and 91 Fifth avenue. They have recently completed the heating plant in a 12-story office building, 50 x 200 feet, at 627-629 Broadway. Horizontal tubular steam boilers were used in all of these buildings.

FARRELL & CONATON, Lowell, Mass., have been awarded the contract for plumbing in the insane department of the Almshouse.

THE BOARD OF EDUCATION, Kinsman, Ohio, is contemplating putting a new furnace in the school building in the near future.

A SPECIAL MEETING of the building committee of the Board of Education of St. Louis was held last week to consider the question of heating and ventilation for the new schools to be built this summer. Professor Kinealy's report was read with care by all the members, and, in consequence of it, the fan ventilating hot blast system of the Marquette will be adopted at the following schools at cost given: Columbia, \$6000; Charles, \$8000; Benton, \$6000; Riddick, \$6000; Dumas, \$8000; Nebraska avenue, \$4000. In making bids for this system the firm must guarantee 2000 cubic feet of fresh air per minute for each room. Parties must furnish their own plans and specifications. At the Washington and Ashland School additions it was decided to put in the direct and indirect steam system, as the boilers are still new and could amply supply heat and ventilation. The Green

Lea Place School, a four-room building, will temporarily be supplied with furnaces taken from other schools. The total expense for all heating apparatus will be \$44,000. Bids will be received until April 5.

WM. FAUST, Pittston, Pa., has the contract for the plumbing and gas fitting in the Lazarus Block.

McKEOUGH BROS., Utica, N. Y., have been awarded the contract for the plumbing in the McGarvey Building.

OTTO L. PETERSON, 217 West North avenue, Chicago, is to do the plumbing and drainage in the flat building of M. Olsson, 104 Potomac avenue.

ARNOLD BROTHERS, 507 South Western avenue, Chicago, have the contract for the plumbing and drainage in the flat building of J. Heperlee, 1456 Lexington avenue.

WILLIAM C. BLETSCH, 1216 Belmont avenue, Chicago, is to do the plumbing and drainage in the flat building of M. Crosby, 1535 and 1540 Sheridan street.

FRANK MEEK, 486 West Eighteenth street, Chicago, has the contract for the plumbing and drainage in the flat building of John Charvat, 769 Van Horn street.

ERNST GARNER, 174 Milwaukee avenue, Chicago, is to do the plumbing and drainage in the flat building of H. Oleson, Sheridan avenue, near Cortland avenue.

J. ZIELINSKI, 1014 North Hoyne avenue, Chicago, is to do the plumbing and drainage in the flat building of J. Biese, 1048 Lincoln avenue.

THE ALCOCK PLUMBING COMPANY, 102 Twenty-second street, Chicago, have the contract for the plumbing and drainage in the Methodist Publishing House, 1517 North May street.

NELSON & CEDERHOLM, 87 West Ohio street, Chicago, are to do the plumbing and drainage in the residence of A. Larson, Berry avenue, near Jefferson street.

NOBLE & THUMM 290 Lincoln avenue, Chicago, have the contract for the plumbing and drainage in the residence of H. Orlikowsky, 202 Warren avenue.

GEORGE ECK, 2208 Archer avenue, Chicago, is to do the plumbing and drainage in the residence of J. W. Luse, 6742 Sherman street.

ALWIN W. BAHN, 393 Gross Park avenue, Chicago, has the contracts for the plumbing and drainage in the store building of Frederick Schmidt, Otto and Walcott streets, and in the store and flat building of Henry Riedmayer, Roscoe and Perry streets.

NELL BROTHERS, 495 Forty-third street, Chicago, are to do the plumbing and drainage in the flat building of Richard Kelly, 5928 La Salle street.

FREDERICK NEUSTADT, 300 North avenue, Chicago, has the contract for plumbing and drainage in the flat building of W. F. Brehm, 220 Seminary avenue.

PAUL H. JAESCHKE, 72 Centre street, Chicago, is to do the plumbing and drainage in his flat building at 516 Evergreen avenue.

RICHARD T. WARD, 1489 West Harrison street, Chicago, has the contract for the plumbing and drainage in the flat building of P. F. Doyle, 1480 same street.

PARK BROTHERS, 79 Dearborn street, Chicago, are to do the plumbing and

drainage in the flat building of John Jeffrey, 6214 and 6216 Greenwood avenue.

WELLS & MALLMAN, 134 Centre street, Chicago, have the contract for the plumbing and drainage in the flat building of C. S. Thornton, 7928 Honore street.

JOHN C. GUNDERMANN, 182 North avenue, Chicago, has the contract for the plumbing and drainage in the residence of E. Fischer, Ashland and Grace avenues.

THE BAKER & SMITH COMPANY, 193 to 197 Van Buren street, Chicago, are to install a steam heating plant for the four store and flat buildings of K. E. Roberts, Cottage Grove avenue, Thirty-first street and Rogelsby avenue. Four locomotive boilers and 600 radiators will be required.

THE CONTRACT for the heating plant for the new Baptist Church building, at Seventh and Fulton streets, Chester, Pa., has been awarded to Harry S. Riley, the West Third street plumber. The plant will cost about \$1500.

ALEXANDER WUERZ Noroton, Conn., has awarded the contract for plumbing and heating his new \$20,000 residence to Jos. Dugdale of South Norwalk.

D. H. KELLY, Derby, Conn., has nearly completed the plumbing and heating of the Plumb Library, in Shelton. A horizontal Bigelow boiler has been used.

ARCHITECTS BROWN & VON BEREN have a new two family house for Jos. Bowden, Jr., of Stamford. Each apartment will have five rooms, with hot water heat and all improvements, and the cost will be about \$6000.

THE EXETER MACHINE WORKS, 32 Oliver street, Boston, Mass., are furnishing Exeter boilers and radiators for the new post office at Lynn, Mass.

THE HIGH SCHOOL BUILDING at Amherst, Mass., is to have a system of heating and ventilation.

IN EXAMINING the City Hall at Detroit, Mich., which is to have a new \$6000 ventilating plant, it was found that a soil pipe had been tapped to carry off roof water where the fan drew sewer air through the opening.

EVANS, ALMIRALL & Co, 41 Day street, New York, are installing a heating plant for the Scovill Mfg. Company, Waterbury, Conn., using Evans' exhaust system of hot water heating.

S. G. RICHARDS, 1454 Broadway, Brooklyn, is installing a heating system in the Broadway Temple, Brooklyn. It will be the plenum system, using a Pride of Brooklyn steam boiler.

PROPOSALS for heating and ventilating Winthrop and Shores streets schools, at Taunton, Mass., will be received at the office of the city clerk until March 23.

JOSEPH C. J. WAINWRIGHT, Brighton, Mass., has been awarded the contract to furnish the heating and ventilating galvanized iron pipes to a large summer cottage, the Cartworld, at Bar Harbor, Maine. The plumbing will be done by Lum & Mitchell, Boston.

EVERETT J. WINN, Dedham, Mass., has secured the contract to do the plumbing at the new Avery school building in East Dedham.

BIDS for the plumbing in the new barracks being erected at Sackett's Harbor, N. Y., are asked for.

THE CONTRACT for the heating of the new Mooney and Brisbane Building, at

Buffalo, N. Y., has just been awarded to the L. H. Prentice Company of Chicago. The radiation is to be supplied by the American Radiator Company, about 15 carloads being required.

A STEAM HEATER is to be placed in the Almshouse at Wakefield, Mass.

HOLYOKE, MASS., will spend \$10,000 in ventilating school buildings.

The returns of the foreign trade of the Dominion of Canada for the six months ended December 31, 1894, show a shrinkage of \$6,322,000 in the value of imports, while native exports held their own satisfactorily. The figures are given as follows:

	1894.	1893.
Imports for last six months	\$54,572,375	\$60,894,062
Exports for last six months	72,599,132	77,604,390

The decline in imports was general in all branches, but a very few articles exhibiting any increase. As regards the falling off of about \$5,000,000 shown in the value of exports, the explanation is given that this is due entirely to a lessened shipment of American agricultural products sent through Canadian ports, the shrinkage in value of which was \$5,500,000. Home commodities exported show a slight increase, minerals and live stock giving the principal gain in this respect. Timber exports are the only ones that fell off to any extent, being \$1,600,000 less than in the last half of 1893. This decline is attributed to the dull condition of the United States market, as Great Britain bought \$2,000,000 worth more wood and timber than in the preceding period.

It is expected that the new Atlantic liner "St. Louis," now building for the International Navigation Company at Cramp's Ship Yard, Philadelphia, will be ready to make her maiden trip early in June. The "St. Paul" will follow her consort early in September. These two vessels will be operated on the main line between Southampton and New York in conjunction with the "New York" and "Paris." This will involve several changes in the arrangement of the International Navigation Company's passenger traffic, and only twin screw steamers will thenceforth be operated on the main line.

A certificate of incorporation has been filed in New York by the New York and Brooklyn Tunnel Company, with a capital stock of \$100,000. It is proposed to build a tunnel between East Sixteenth and Whitehall streets, New York City, along the most direct and feasible route under the bed of the East River to a point in Brooklyn between North Eighth street and Atlantic avenue. The length of the road to be built is estimated at about two miles. It is to be an underground railroad, standard gauge, and to be operated by electricity or other motive power. The directors of the company are: Thomas A. Patte-son, Jr.; Charles J. Schlegel, Walter J. Alma, John C. Bucken, Charles Kuehn-mund, John V. Bouvier, Jr., Frederick P. Delsfield, Frank H. Knight and Samuel S. Slater.

A project is on foot to utilize Glen Falls, in Ontonagon County, Mich., in developing electric power wherewith to operate a number of abandoned copper mines in the neighborhood. It is calculated that in the existing fall 4377 horse-power is available, and that it can be increased.

THE RETAIL STORE.

The Ladies' Delight Oil Cooker.

A recent addition to the assortment of oil cookers manufactured by Page Brothers and Co. of 227-233 Cam-

bridge street, Boston, Mass., is the new Ladies' Delight, an illustration of which is presented in the accompanying engraving. This is claimed to be something of a departure in the line of oil cook stoves and represents the results of many years' experiment. The manufacturers feel that in the Ladies' Delight they have the "neatest, most efficient, most compact and easily managed oil cook stove ever presented to the public." From an inspection of the engraving it will be seen that in the top surface there are three cooking holes, each being 8 inches in diameter. The rear one is intended for the reception of the oven, which is of large capacity, being 18 inches long, 14 inches high and 12 inches wide. The makers state that they use the same kind of burner and font as that employed in connection with their Beauty oil heater. Some of the special points claimed for the Ladies' Delight as now made include the following: 1. There is no drawing up of the flame and tendency to smoke. 2. No heating of the oil reservoir, producing what is termed "sweating of oil," necessitating constant care and wiping. 3. No generation of gas from heated oil and liability of explosion and catching fire. The heater here shown is known as No. 10, and the font has a capacity of 1 gallon of oil, which it is claimed will burn from 10 to 12 hours. The tubes

The Ladies' Delight Oil Cooker.

and font are of heavy seamless brass, and as the double central draft is embodied in the construction of the cooker, the font remains cool and perfectly safe. The oven used is especially adapted for the Ladies' Delight and is

Enterprise Raisin Seeder.

The Enterprise Mfg. Company of Philadelphia, Pa., for whom J. C. McCarty & Co., 97 Chambers street, New York, are agents, are introducing another labor saving device which they

Enterprise Raisin Seeder.

have named the Enterprise raisin seeder, shown in the accompanying engraving. The raisins, after stemming, are fed into the hopper, the revolving of the crank forcing the raisins between

a rubber roller and toothed cylinder, permitting the seeded raisins to drop into a receptacle while the seeds are discharged through a spout. It is said the ordinary washing usually given raisins is sufficient to insure better results than if the fruit is pressed through dry. The family size will seed, it is said, 1 pound of fruit in five minutes, a larger size for hotels, bakeries, &c., having a greater capacity. Both are tinned. The family size is numbered 36, that for hotels 33.

Crescent Automatic Spray and Force Pumps.

The Crescent Brass & Iron Works, Detroit, Mich., are putting on the market the spray and force pumps herewith illustrated. The one shown in Fig. 1 is described as a reservoir pump, with a heavy brass cylinder, an extra large galvanized iron air chamber, 4 x 11

Fig. 1.—Pump No. 1. Fig. 2.—Pump No. 2.

Crescent Automatic Spray and Force Pump.

inches in size, and a galvanized iron suction rod. The spiral spring is referred to as being made of heavy spring brass wire, and the valves of non-corrosive metal. The saucer shaped foot has a strainer on the top to prevent clogging with dirt from the water. Two nozzles are furnished with each pump, in which a sprayer is adjusted; also 12 inches of good rubber tubing. It is explained that the reservoir may be filled and the pump carried "a-field," and that with the fine spray adjustment the liquid used will last from 10 to 15 minutes; or, if desired, the pump may be made to work as well from a pail. The pump shown in Fig. 2 is designed for bucket use only, but otherwise is similar to the No. 1. It has a galvanized air chamber 2 x 10 inches, a heavy brass cylinder, metal valves, brass

made with extra large side door and double shelves.

spiral spring and a saucer shaped anti-clogging foot. The length of the rubber tubing is 12 inches.

Ideal Water Filter.

The Germ Proof Filter Company, 16 Cedar street, New York, have brought out an improved water filter, as shown in the accompanying cuts. Fig. 1 represents the direct filter, known as the Cataract, which is $3\frac{1}{4} \times 3$ inches in size. The top is of cast brass, in one piece and nickeled, as are all the metal parts. Connecting the top and bottom is a perforated hollow metal pipe, which passes through a natural stone filter 2×2 inches in size with rounded edges. The top and bottom of the filtering block are made tight with rubber washers, thus compelling the water passing into the reservoir between the filter and heavy outer glass case to make its way through the filtering stone into the inner pipe and so out at the bottom. There is an inside thread cut in the circular rim forming part of the upper cap, by means of which the apparatus is screwed to the permanent faucet. Fig. 2 illustrates the same filter with

Fig. 1.—Direct Cataract Filter. Fig. 2.—Ideal Filter for Filtered or Unfiltered Water.

goose neck attachment and extra faucet. Filtered water is delivered through the goose neck, while unfiltered water passes more rapidly through the faucet seen in the cut. The filtered supply is controlled by the main faucet on the water fixture. The filters are quickly taken apart, when any accumulation of matter can be instantly brushed off the stone block. Underhill, Clinch & Co., 94 Chambers street, handle this article in New York and nearby territory.

Air Tight Waste Trap.

The Baldwin Refrigerator Company, Burlington, Vt., use on their refrigerators a closed waste trap. It is in cup form, with a screw top, having a short pipe passing through the cover and down nearly to the bottom of the cup. This is slipped over the waste pipe of the refrigerator. Near the threads on the upper portion of the cup are openings through which the waste water drips. The trap is made in this form, it is explained, to prevent warm air ascending the drip pipe and to prevent water splashing the bottom of the refrigerator when doors are suddenly closed. The trap can be taken apart for cleaning, and is referred to by the manufacturers as simple and effective.

THE FRANCE SNYDER COMPANY have opened a new stove store at 523 Madison avenue, Covington, Ky. The concern are the successors to the late J. M. McClung, who was in business for many years in that city.

The Evans Protective Milk Can.

We show in the accompanying illustrations the special features of the Evans protective milk can put on the market by Keen & Hagerly, Baltimore, Md. Fig. 1 shows the body of the can with the top or cover detached, indicating the manner in which the cover is locked to the body. Before locking a small

The Evans Protective Milk Can.—Fig. 1.—View of Can with Top Removed.

card or seal on which the shipper writes his name is inserted in the lock, and in order to unfasten the top a nail or some sharp instrument must be inserted in the opening of the lock. Doing this breaks the seal and the receiver therefore by examining the seal before unlocking the can is enabled to see at once if the seal has been tampered with and by this means locate the trouble. The cover furthermore has a rubber gasket making it impossible to pour the milk out of the can by upsetting. The features of this lock will be more fully understood by referring to Fig. 2, which is an outline sketch of the lock itself. It is pointed out that the advantages of this device

Fig. 2.—Detailed View of Lock.

are that it prevents tampering with the contents and thus settles all disputes of measurement, quality, sediment or adulteration. It is simple, does not get out of order and requires no padlock or chain or extra key.

MEMORANDA.

FOOTE & SHEAR COMPANY, Scranton, Pa., have removed their wholesale hardware business from 513 Lackawanna avenue, where it was established 45 years ago, to 119 Washington avenue. They will occupy seven floors 25×155 feet in the new Carler & Kennedy Building, giving them more than 27,000 square feet of floor space. The building is fitted with all necessary fixtures and

appliances for the transacting of the large business which this firm enjoy. The capital stock of the company has been recently increased. They will continue the wholesale and retail hardware, plumbing, tinning and heating departments as heretofore, but with largely increased facilities.

MCLENNAN & McFEELEY, hardware merchants, have sold out their Victoria business and have concentrated their concern in Vancouver, B. C.

N. KLEIN of Richmond, Va., issues an announcement under recent date to the effect that on February 16 he admitted W. P. Klein to one-third interest in his business and appointed George Klein his attorney. The business will hereafter be conducted under the style and title of N. Klein & Son, who will assume all liabilities of and collect all outstanding bills due the old firm. The new concern are located at 620 East Broad street and carry a complete line of stoves, ranges, fire place heaters and house furnishing goods. They also give attention to tinning, plumbing and gas fitting.

LEFEVRE & Co. of Chillicothe, Ohio, have removed their store from the old stand to 32 East Second street, where their entire establishment is now on the ground floor. They make a specialty of mantels and grates, and handle a smoke consuming furnace made by the Otsego Furnace Company.

THE AVERY STAMPING COMPANY, Cleveland, Ohio, have been appointed Western agents for the full line of Housekeeping Hardware, Garden Tools, &c., manufactured by C. W. Dunlap & Co. They intimate that with the increased facilities of the manufacturers customers may rely upon the prompt and satisfactory filling of all orders, and state that all inquiries for catalogues, prices, &c., from trade located west of New York City should be addressed to the company at Cleveland.

J. W. GREEN, Canandaigua, N. Y., has bought out the interest of the Canandaigua Tinware Company of that place and will continue to manufacture the improved Queen Cooker and will likewise do general jobbing, plumbing and steam fitting.

THE RINGEN STOVE COMPANY, St. Louis, Mo., issue a neat catalogue relating to the Quick Comfort refrigerators, the merits of which they commend to the trade with perfect confidence. In the introductory pages they speak of the general construction and some of the details are illustrated and carefully described. The casters are shown in this way, likewise the trap. A broken view illustrates the circulation in the refrigerator; then follow the illustrations of the different kinds of hardwood refrigerators, covering some 17 pages. A number of grocers' and butchers' refrigerators are likewise illustrated and so are sideboard refrigerators and ice chests. Tables of sizes and prices are given with the illustrations.

Remarkings on the present condition of the anthracite coal trade, the Philadelphia Ledger says that the trade continues to show that the companies are practically disregarding all efforts at restriction and are mining about all the output their collieries can produce. They are now going on at a rate which will put upon the market for the current month at least 4,250,000 tons, instead of the allotment agreed upon of 3,500,000 tons.

ROOFING AND CORNICE.

A New Roofing Slate Association.

For some little time past the condition of affairs in the Bangor slate region has not been altogether satisfactory to leading operators, and a meeting was recently held for the purpose of correcting, if possible, some of the existing evils. A movement was instituted which has resulted in the formation of what is known as the Bangor Roofing Slate Manufacturers' Association, the object of which is to maintain a uniform scale of prices for genuine Bangor slate, and to sell direct to the trade, or through the hands of four dealers, namely: Auld & Conger of Cleveland, Ohio; John D. Emack of Philadelphia, and E. J. Johnson & Co. and John Galt & Sons of New York City. The association will issue a card to the salesmen so that the trade will know that no one offering Bangor slate is authorized so to do unless he can show authority direct from the association. The latter have also adopted a certificate which will be stamped with the official seal as a trademark, being signed by the inspector, and will be attached to every invoice that goes out, certifying that car No. is loaded with genuine Bangor roofing slate. The architects of the country will be furnished with a copy of this certificate, and if they will request or compel the party furnishing the slate to produce the certificate, the purchaser will know whether or not he is getting what is called for. This course of procedure has been taken by the association for the reason that Bangor slate is largely called for by architects and to prevent the substitution of inferior grades when Bangor is distinctly specified.

The next best grade of Bangor slate is what is known as the Albion Vein, at Pen Argyll, located 3 miles from Bangor, Pa. The manufacturers in this section have suffered largely by having inferior slates offered as their own, and it is believed that they will form an association similar to that at Bangor, adopting the same rule of sending out a certificate. The best element of the trade has requested some such action as this to be taken so that they can be assured that prices will remain firm and that all will pay the same price for their slate. In Bangor the formation of this association has taken away the petty jealousies and envy that have existed for some time between different manufacturers, and it is probable they will all act in harmony in the matter of lowering or advancing of prices. The manufacturers have adopted a price-list and have made it from 15 to 25 cents a square lower than last year's list. We understand that in the formation of the association mentioned there has been no effort at combination for the purpose of putting up prices, but simply for keeping them at such a level as will pay a reasonable profit and at the same time protect the name of the goods.

In connection with this matter the following, taken from the Bangor Observer of date of March 7, will prove interesting:

A meeting of all the slate manufact-

urers of the Bangor region, the Old Bangor Company excepted, was held last Thursday afternoon at the office of Thomas Ditchett. The outcome of the meeting is of great importance to the people of Bangor. For the past two months a bitter fight in prices has been in progress between the manufacturers, and slate was sold at ruinously low prices. Most of the slate region in the United States felt the bad effects of the strife. We are very glad to be able to state that the end of such a state of things has come. The meeting resulted in perfect harmony of action.

A list of prices was unanimously adopted, although much lower than the list that ruled so long, yet it was apparently satisfactory to all. The meeting had the assurance that the Old Bangor Company would heartily co-operate both in prices and also in the matter of issuing a certificate with each car of Bangor slate in order to protect the trade. This certificate will be issued from the general office of the manufacturers, signed by an inspector appointed for the purpose, whose particular duty will be to see that each shipment of slate shall be as stated in the certificate. The meeting adjourned with the best of feeling and of course every one was jubilant because of the final result. The companies were represented as follows:

American Bangor Slate Company, H. J. Reader, Conrad Miller, J. E. Long and C. S. Colbert.

Bangor Excelsior, R. S. Brown.
East Bangor Consolidated, S. C. Smith and William Bray.

North Bangor, D. F. More.
Star, Charles Ford and Richard Payne.

Auld & Conger, W. E. Lloyd.
East Bangor Slate Mining Company, S. L. Fidler and James Masters.

Columbia Bangor, Thomas Ditchett.

Sub-Letting in Building Contracts.

Architects and intending builders have recently been in receipt of a protest from the Metal Cornice Manufacturers' Association against letting the different parts of a building to one general contractor. The communication bears date at Chicago and reads as follows:

Believing that the practice of letting the entire work upon a building to one general contractor, the different parts of the work to be in turn sublet by him, instead of letting those different parts direct to the contractors who are actually engaged in the different trades, is detrimental to the general interests of the owners, architects and building contractors, and believing that the practice is increasing, because of the efforts of those engaged in general contracting, while on the other hand, up to the present time, no set of men have taken the trouble to systematically oppose it, we shall herein attempt to present the arguments against it. We will consider how the matter affects the owner, the architect and the contractors for the different trades.

1. As to the Owner.—We have never heard it claimed that an owner could get a better or cheaper building from a general contractor than he could by dealing di-

rectly with the different contractors, and we do not see why he should. Any one will work at least as cheap for the owner, who has the money, as for a contractor, who often has no capital of his own, and depends upon getting the money from the owner with which to pay his sub-contractors; the result frequently being disastrous to the sub-contractor, if, through having taken the work too low, or if, through mismanagement, he does not get enough to pay the expenses of his business and his sub-contractors' bills. If, on the other hand, the contractor does have capital invested, so that one can safely do work at low rates for him as for the owner, then some one must pay a profit on this capital, and that some one must be the owner, who may pay it directly in paying a higher price for his work, or indirectly by getting poorer or cheaper work than he had contracted for. It is good business policy to get rid of the middleman wherever possible, and the general contractor is surely one. It is certainly harder for the owner and more expensive for him to make changes on a building let to a general contractor than where the work is done directly by those engaged in the different trades, as on all changes the general contractor expects and demands his profit. To the owner again: Another and very material reason why work should be let in separate contracts, instead of in one general contract, is that the chances and the rewards to the general contractor of combination or pooling are so much greater that it is much more likely to be done. There are always more general contractors, so that it is comparatively easy for them to get together and arrange things, and the jobs taken as a whole are so large that it is worth while for them to try to make a combination, even if they cannot often succeed.

2. As to the Architects.—While we have never heard it claimed that by letting the work of a building to a general contractor the owner would get a better building, or that he would get one for less money, it is frequently asserted that work done in that way is less trouble to the architect and to the owner, and that it can be done in less time if it is let to one contractor rather than to several. When the first of the World's Fair buildings were figured, bids were taken for the entire building and for the several parts. The separate bids were in all cases the lowest, and the work was let and done that way. We have always supposed that those buildings were put up with unusual rapidity, which would seem to prove that to get work done rapidly it is not necessary to let the entire building to one contractor. That letting the work upon a building in separate contracts for the different branches is cheaper than letting it all in one, and that it need not result in slow work, is evidenced by the experience of the Board of Education of this city, who always divide their work, though they occasionally take figures the other way, but always find them higher than the separate bids. We could never see how a general contractor could get his work done any more quickly than an owner or an architect could. We could never see what magic there is in a contract made by a sub-contractor with a general contractor that makes it easier for the general contractor to crowd him than it would be for the architect or owner to do it. If it is admitted that an owner is likely to get either a cheaper or a better building, or both, when he divides his contracts as much as possible, is he getting proper treatment at the hands of his paid professional adviser, his architect, when that architect counsels him to let his work to a general contractor and his advice being given, it would appear, for the purpose of saving trouble to the architect? Does the architect's plea that he himself is not paid sufficiently to enable him to give his client the advice that his best interests demand tend to raise the architect's profession in the eyes of his client and the general public? If his present rate of compensation is such that the architect cannot look after the details that he is expected to do where the

work on a building is divided, are there not several plans that an architect should adopt rather than advise the owner to let the work in one contract? If the architect is so situated that he or his office force can attend to it, why not let him demand higher compensation from the owner? If that will not do, if the owner will not pay 2, 3 or 5 per cent. more to his architect for looking after these details, why cannot the architect have some contractor or superintendent or clerk of the works take charge of that part of the work on a percentage of from 5 to 10 per cent.? We understand that it has been done. Or, a cheaper method would often be to have the owner hire some one on a salary to look after this part of the work.

The advantage of these two latter methods over letting the whole in one contract is that all the contracts will finally be let by some one who will have more interest in getting good contractors, in having the work well done than does a general contractor, whose sole interest, or at least his paramount interest, is to get the job done cheaply, and that is the backbone of this protest; that the general contractor has so little regard as to how the work is done; that general contracting breeds and from

have heretofore done as part of their duty and for which they are paid. It is a very sure thing that whatever trouble the architect saves he must before long allow for either directly in what the owner pays him for his services or indirectly in the importance of his profession in the building world. At present an easy way for the architect or for the owner to ascertain which is the cheaper way to get work done is to take bids both ways—that is, from the general contractor for the entire job and also from the different trades in detail. We are perfectly satisfied to abide by the result of such tests. The general contractors will also probably be satisfied, as at present they are not as strongly entrenched in their position as they might be, otherwise they might take the position that was taken in Philadelphia some few years ago, where the Master Builders' Exchange announced that "members should decline to give estimates in the aggregate for work when the owner or his agent are receiving estimates in detail for the same." At Louisville also the Builders' Exchange adopted rules to the same effect.

When bids are taken both ways, it should, however, be understood that bids given to an architect for the different parts of the

an owner who thinks it is not worth his while to make a direct contract with him, or to recognize him in any way. The practice certainly tends to lower the standard of work and to lessen the pride of the subcontractor in his work.

Finish for Slate Roof at Ridge and Hip.

From M. A. Suffolk, Va.—Will The Metal Worker inform me how to make a ridge finish for a slate roof, the same being made from the slate with which the roof is covered, as shown by the inclosed drawings? I tried to put a ridge roll made of galvanized iron on the ridge and hips, but the architect claimed the effect was destroyed. Which is the better finish at ridge or hip, to have the slate lap and use roofing cement, or to have the ends butt together?

Answer.—In Fig. 1 is shown a portion of a slate roof as derived from our

Fig. 1.—The Sketch Submitted by "M. A."

Fig. 3.—Double Width Slate Used at Hip.

Fig. 5.—Lap Joint at Ridge or Hip.

FINISH FOR SLATE ROOF AT RIDGE AND HIP.

its nature must breed a class of scamp subcontractors, to the loss of those who want to do good work. It is because we think that the architects take pride in their work and in their buildings and wish to have their buildings well built that this appeal is made to them, that this phase of the matter is presented to them. In the past, general contracting has not prevailed in Chicago as it has in the East, and we think that the present tendency comes from Eastern influences, both of architects and general contractors. We understand that general contracting has been in vogue in the East from colonial days, from before the days of architects, as it were; that in early days there was no architect. The contractor builder was everything; all in all. What power, influence and importance the architect has there now is largely in spite of the builder. In New York a good many years ago an architect was hardly known. Most of the houses now are built by builders, and architects have little to do with them. The same state of affairs did and does exist at Philadelphia and other Eastern cities, so that the man who builds his own house in those cities is considered to have done something to distinguish him from ordinary people who buy theirs ready made from the speculating builder. The builder has never been so important here. The architect has always been more important, and why the architects should wish or even be willing to give up so much of their business and responsibility we cannot understand. It is suicidal for them to shirk or to let any one do for them any large part of what they

building are solely to enable him to let the work in separate contracts; and that to disclose those bids, without the consent of the makers of them, to a general contractor to enable him to take the entire work, is as flagrant a breach of fair dealing as it would be to disclose them to any other competitor. We protest because it increases the cost of doing our business, as we sometimes have to figure five times as often as we should to get the same amount of work direct from the owners or architects. We protest because it tends to poor work, as very few general contractors are nearly so particular as to the quality of work done as they should be, and will let work to the cheapest man, often when they know the chances are against his doing a good job. The temptation to do this is strong. Their interest in the job is solely to make what they can out of it; they will not give a dollar preference for a first class job, where an owner would give ten; all they require is something that can be made to pass. We also protest because so many of the general contractors do not pay their subcontractors as promptly as they should; many of them do not pay nearly as promptly as they get their own money, and some of them refuse to settle with or pay their subcontractors until long after they have received their own money. The tendency, from our point of view, is certainly to increase the cost of doing business, which must, when things are settled, come out of the owner; to lower the quality of the work, and to make the subcontractors feel, even the best of them, that it is hardly worth while to do a good job for

correspondent's drawing. The hip finish is made by laying one row of slate with the edges parallel with the hip. To make this finish a hip board, which is about one-half the width of the slate used, is first nailed to the hip, as shown in Fig. 2. This board can be cut on a bevel, being 1 inch thick at the hip and $\frac{1}{2}$ inch thick where the slate joins. The roof slate are then cut on a bevel so as to butt against the edge of the board. Paper can then be put over the boards, when the hip slate are to be laid as shown in Fig. 1, and secured by nailing. Another kind of finish is shown in Fig. 3, the hip slate being of double width, so that for a roof of the pitch shown they extend up the roof sufficiently to allow for proper nailing. If slate of ordinary width were used for this finish, as indicated by the dotted lines in Fig. 4, the slate would not extend up the roof far enough to be nailed. There are a number of methods for making the joints at hip or ridge. For the hip sheet metal caps can be

placed over the hip joints, being so laid as not to be exposed, but extending up the roof far enough to be nailed and laid with each row of slate. The slate can be laid with butt joints at the hip, as shown in Fig. 5. Another method is to dispense with the caps and bed the hip joints in roofing cement. Lapping the slate, as shown in Fig. 4, and then filling with roofing cement does not give as sightly a finish as is shown in Fig. 5. For a ridge finish the last row of slate can be laid with butt ends, being laid in cement at the ridge. Another method is to place bent strips of sheet metal over the ridge, the strips to extend on either side nearly as far as the last row of slate. After these strips are in position the slate are applied. When finishing without a ridge roll the rail heads can be covered with roofing cement. When making a butt joint, as shown in Fig. 6, the slate are to be cut from the upper side, thus giving the slate a beveled edge.

FLASHINGS.

THE 1895 CATALOGUE issued by the St. Paul Roofing, Cornice & Ornament Company, St. Paul, Minn., contains a great deal of information of interest to the roofing and cornice trade. In an introductory note they direct particular attention to their patent slip joint constructions, the plates being galvanized after they are atamped and thus given a perfect coating. They also allude to their system of remodeling, by which they can beautify an old or unsightly building, while offering, they say, an absolutely dry and warm construction. In the earlier pages a number of samples of galvanized work are illustrated, showing the material adapted to all sorts of buildings of all sorts of architectural design. Fine half-tone engravings, showing the appearance of their rock face plates, follow. The transformation of an old building is likewise shown. The ceiling work comes next, very handsome examples of this form of interior finish being presented. A number of pages are given up to cornices. Metal shingles are illustrated, likewise steel roofing. Toward the close of the catalogue a variety of miscellaneous articles are illustrated, such as conductor pipe, eave troughs, &c. Ridges, hip molding and finials are shown in various styles. Tables of sizes are given wherever called for, and prices accompany the illustrations.

HENRY BEUTELSPACHER, Bridgeport, Conn., has commenced work on his contract for metal work on the new German church at Torrington, and has just completed the plumbing and tinning of Christian Biltz's new house on Sherman street. He also has a contract for piping, &c., at the Eckart brewery, and has the contract for the metal work and gas fitting at the new Greek church at East End.

THE LOUIS BIERLER CORNICE COMPANY have been incorporated at Chicago, with a capital stock of \$10,000; incorporators, P. L. Biegler, T. A. Delamater and F. B. Dickinson.

BEER & HESS have recently removed their office at 109 more commodious and centrally located quarters at 119 West Thirtieth street, New York City. This move, we understand, was made necessary by the rapid increase in their

business and in order to provide better facilities for turning out cornice and skylight work and for executing tin, slate and metal roofing.

A REVISED PRICE LIST for Bangor roofing slate was adopted at a recent meeting of the Bangor Roofing Slate Manufacturers' Association. Particulars of the change will be found in our trade report columns.

The Smith Flanged Ventilating Fan.

Our illustration shows the method of constructing the Smith ventilating fan, manufactured by the Huyett & Smith Mfg. Company, Detroit, Mich., of sizes 7 feet or more in diameter. It will be noticed that the case or rim of the fan

the fan case. These flanges are bored for anchor bolts, which extend clear through the wall in which the fan is placed, thus making the fan perfectly firm.

The hardness which is lacking in aluminum can, it is said, be imparted to it by the addition of chromium, under a new process just introduced. The method is claimed to render the aluminum as hard as chrome steel.

A new emery wheel was recently subjected to an unusual test by the Springfield Emery Wheel Company of Bridgeport, Conn. The wheel is 14 inches in diameter by 2 inches thick. It was run at a speed of 4000 revolutions per minute, which is nearly three times the

THE SMITH FLANGED VENTILATING FAN.

is made in four sections, each section being firmly bolted to the fan arms. In order to facilitate the handling of these fans they are always shipped knocked down, or in other words, the arms, shaft and case are removed from the fan. They may be set up or put together very readily by simply bolting the different parts together. The hanger arms are made in sections bolted together at the center, forming a sleeve in which the journal box is secured and made adjustable by means of the four bolts engaging the sleeve with the bearing, as shown in the cut. The fan wheel is put together with bolts, and is also shipped knocked down. The blades of the wheel are provided with braces securing them to the brace disk, which in turn is secured to the fan shaft, thus making a strong, tight wheel. All parts are marked and numbered so that they may be put together without difficulty by any competent mechanic. As these fans are usually built in walls or partitions, they are provided with heavy angle iron flanges, which are firmly bolted to

usual speed of a wheel of this size. The wheel suffered no harm from the great strain to which it had been subjected.

The insurrection in Cuba is likely to exert a serious effect on the export business of this country with that island. Manufacturers are reported to be unwilling to do any business in that quarter except on a strictly cash basis. The trouble has already caused a falling off in the corrugated iron roofing trade with Cuba. The latest advices, however, point to the likelihood of the breaking up of the insurrection within a short time.

A consular report to the French Government from Cape Town, South Africa, mentions that house furnishing goods of cast and wrought iron and tinware have a very considerable sale in the Cape Colony. Copper kitchen utensils are rarely used. Enameled ware offers the best field.

PLUMBING and GAS FITTING.

Growth of the National Association of Master Plumbers.

In reviewing the work of the National Association of Master Plumbers, National President John Mitchell finds that during the present fiscal year 19 local and 5 State associations have been formed, and reckoned from the *per capita* tax already received, represent 283 new members, as follows:

Florida Association	18
Arkansas Association	30
Northampton, Mass.	18
Asbury Park, N. J.	12
Janesville, Wis.	4
Harrisburg, Pa.	15
Allentown, Pa.	14
Scranton, Pa.	21
Individual members	84
Aurora, Ill.	6
Bloomington, Ill.	5
Joliet, Ill.	5
Springfield, Ill.	8
Rock Island and Moline, Ill.	10
Elgin, Ill.	6
Danville, Ill.	4
Ottawa, Ill.	5
La Salle and Peru, Ill.	5
Jacksonville, Ill.	4
Mendota, Ill.	4
La Grange, Ill.	5
Total	283

It will be seen that, as compared with the same period last year, when there was an increase of 153 new members, there is an increase of 125 new members over the increase of last year. State associations have been formed in Wisconsin, Nebraska and Tennessee, which will further strengthen the National Association.

Plumbers' List of Manufacturers.

A year ago last April the National Association of Master Plumbers published a list of all the manufacturers and jobbers of plumbing material who approved the protective resolutions of the association, better known as the Baltimore resolutions. President Mitchell informs us that since that time many firms whose names are not on the list have signed the resolutions, necessitating the publication of a new list, copies of which will be mailed direct to the trade. He further states that several firms have complained of the omission of their names, and in order to afford all an opportunity to have their names especially recommended to the trade he invites all manufacturers and jobbers who approve of the resolutions to send to national headquarters, John Mitchell, 113 Hudson street, New York City, for copies for signature. The new list will go to press on March 31.

ALFRED WHITE and BENJAMIN S. COURTIS, Lynn, Mass., have left the employ of the L. A. May Company and

formed a copartnership in the plumbing business. They will occupy Chamberlain's old stand on Mulberry street.

The Douglas Rubber Elbow.

The John Douglas Company, 162 to 166 Poplar street, Cincinnati, have just brought out a rubber elbow for use in making tank connections with water closets, which is herewith illustrated. This elbow is fitted on a brass tube with a slip joint connection. A brass sleeve, threaded on the inside and fitted with

is used instead of the needle point, which, it is said, precludes any possibility of the orifice, through which the gasoline passes, from becoming enlarged. The arrangement of the turner is also such as to permit of its being turned in any direction for burning paint, melting a joint or heating objects, and does not require packing to keep it tight. As will be noted, the furnace is provided with an iron vessel for melting solder, &c., or the vessel may be dispensed with and a cover placed in position when it is ready for

The Douglas Rubber Elbow.

a rubber washer, is placed on the brass tube referred to. It can be adjusted at any distance desired and tightly screwed in place. This elbow is claimed to insure a full and smooth water passage to the bowl. A 2 inch or vent connection of this description will also shortly be placed on the market. Geo. L. Bottum, 131 Lake street, is Chicago manager for the company.

The Henrie Improved Plumbers' and Tinnners' Soldering Furnace.

The Henrie Mfg. Company, Xenia, Ohio, have just brought out the improved furnace especially designed for

The Henrie Improved Plumbers' and Tinnners' Soldering Furnace.

plumbers' and tinnners' use illustrated herewith. They say its construction is such as to be absolutely proof against leakage, the burner being so arranged as to require no packing. A blunt valve

is used instead of the needle point, which, it is said, precludes any possibility of the orifice, through which the gasoline passes, from becoming enlarged. The arrangement of the turner is also such as to permit of its being turned in any direction for burning paint, melting a joint or heating objects, and does not require packing to keep it tight. As will be noted, the furnace is provided with an iron vessel for melting solder, &c., or the vessel may be dispensed with and a cover placed in position when it is ready for

Draining Plumbing Systems.

From G. D. B., Canfield, S. O.—We enjoy the letters of inquiry in *The Metal Worker* and the comments upon them very much, and we receive a great deal of information from them that is hard to get otherwise. We in our turn would like to ask our brethren of the colder climes how to arrange a system of plumbing in a residence so that there will be no trouble of freezing up and bursting of pipes in cold weather. Most of the houses here are built very open, with no provision for heating or keeping the pipes warm. In our work we place a stop and waste cock in the ground with a case around it and having a rod running up to a convenient point. The pipes are all graded so as to drain this cock. We are often told, however, that in the North, where the climate is more severe, no such trouble is required, and we suppose that it is because the pipes are better protected. We would like to hear from plumbers on this subject.

CAMP & CRANE, 27 Maiden lane, New York, display in their window several different kinds of shower baths, one being designed for use with the old style lever bath bibbs, a three-way brass piece being used to effect the connection. Rubber hose runs from two ends of the brass piece and connects with the bibbs. From the other end the hose for the shower or spray is connected. In this way the shower attachment may be used in connection with old bath fixtures.

Central Supply Association.

The quarterly meeting of the Central Supply Association, which is composed of the wholesale dealers and manufacturers of plumbers' supplies from Pittsburgh, Pa., to the Missouri River, was held Tuesday, 12th inst., at the Southern Hotel, St. Louis, Mo. There were present 72 members and 13 represented by proxy, making a total attendance of 85 out of a membership of 120.

Morning Session.—The morning session opened at 10 o'clock and was devoted to routine business. The report of President Wolff was read and favorably received. The treasurer's report showed the finances to be in good condition, and the secretary reported a number of applications for membership which were favorably acted upon. The association then adjourned to meet at 2.30 p.m.

Afternoon Session.—The principal business of the afternoon session was the discussion of the motion to "request trade papers to discontinue quoting net prices on wrought iron pipe." This motion called forth considerable debate and was finally adopted, and the secretary directed to request the different publishers to abide by the resolution. At 5.30 the association adjourned.

At 6.30 the association sat down to a sumptuous banquet tendered them by the St. Louis Supply Association, after which they adjourned in a body to the Olympic Theater, where the opera "Robin Hood" was the attraction, and where all the boxes and the first three rows in the parquet had been reserved for them. The members of the opera troupe made some timely hits at the expense of some of the older members of the association, which were greatly enjoyed by those present.

The officers of the association are: President, John F. Wolff, Chicago. First vice-president, John Walker, Detroit.

Second vice-president, Theo. Ahrens, Jr., Louisville, Ky.

Secretary, Wm. M. Webster, Chicago.

Treasurer, O. F. Felix, Pittsburgh, Pa.

The St. Louis Supply Association is officered as follows: President, W. E. Althaus of the Western Brass Mfg. Company; vice-president, Thomas Cahill of Cahill, Swift & Co.; secretary, Albert Webb of Albert Webb Supply Company, and treasurer, G. F. Detrick of Ripley-Detrick Supply Company.

Eastern Supply Association.

The regular quarterly meeting of the Eastern Supply Association was held at 284 Pearl street, New York, last Tuesday. The following business concerns were represented: J. L. Mott Iron Works, DuBois Mfg. Company, Owen & Salter, Fred Adee & Co., J. Regester & Sons, Jno. Trageser Steam Copper Works, Mayor, Lyne & Co., Hoy & Co., Haines, Jones & Gadbury, Curtis & Co., Colwell Lead Company, C. Hoffman, Jr., Eaton, Cole & Burnham Company, McNab & Harlin Mfg. Company, R. M. Wilson, Miller & Coates, Henry Huber Company, Stewart Ceramic Company, Smith & Anthony Company.

President John Reid occupied the chair.

The secretary reported a membership of 30 concerns, covering the following territory: New York, 17; Philadelphia, 6; Washington, 1; Baltimore, 1; Cohoes, 1; Utica, 1; Home, 1; Trenton, 1; Albany, 1; total, 30.

The treasurer's report showed a balance of \$900. The dues of the association were fixed at \$10 per year, and it was agreed that the fiscal year of the association should commence March 1, 1895. It was stated that many letters had been received by the association asking who were entitled to recognition as dealers. On motion, it was decided that such queries can be answered only when they relate to its members.

A communication from the Association of Manufacturers of Heating Apparatus was received stating that "the members of this association agree not to exhibit any goods at the meeting place, or spend any money in entertaining the members of the Master Steam and Hot Water Fitters' Association or Master Plumbers' Association, either local, State or National, and that we also agree to discountenance, as far as possible, the sending of representatives to such meetings."

A communication was received from the Willets Mfg. Company, Trenton, N. J., stating that through the solicitation of the Central Supply Association all their ware is now being stamped with their name, and that they are using the iron pipe thread.

communicate in writing with the secretary of the Master Plumbers' Association of said State or locality, informing him of the fact that the policy of this association is to adhere strictly to the Baltimore resolutions, and that as the said Baltimore resolutions specifically state that licensed plumbers regularly engaged in the plumbing business, and with an established place of business, are entitled to purchase plumbing goods, this association does not deem it wise or expedient to depart from that rule. In the event of failure to receive redress from the local association, it shall be the duty of this association to again take up the matter and refer it to the secretary of the National Association, and to notify him that until such time as the boycott has been raised the operation of the Baltimore resolutions will cease."

There being no further business the meeting adjourned, and the members then repaired to the Fulton Club to partake of a luncheon prepared by the Entertainment Committee.

Hardwood Bathtub.

The accompanying cut shows a hardwood bathtub which C. A. Blessing,

Hardwood Bathtub.

President Reid announced as a standing committee on entertainment, Messrs. Hoffman, Douglas and Trageser.

It was also announced that the National Executive Committee is composed of John Clifford, L. D. Lawin and John Walker of the Central Supply Association; E. F. Souther, L. H. Tillinghast and F. J. Knox of the Plumbers' Supply Association of New England; and John Reid, Jas. E. Salter and Henry S. Regester of the Eastern Supply Association.

The following resolutions were then unanimously adopted:

"Whereas, It has been customary in the past for manufacturers and jobbers of supplies to have their representatives attend the meetings of the State and National Associations of Master Plumbers, entailing a great loss of time on the part of the representatives and financial loss to their houses; be it

Resolved, That this association discountenance such action in the future.

Resolved, In case a State or local association of master plumbers makes a demand upon any member of this association to confine its sales of plumbing goods in that State or locality to members of said Master Plumbers' Association, such demand shall at once be referred by such member to the secretary of this association. The secretary of this association shall thereupon com-

Philadelphia, Pa., has recently placed on the market. With the exception of the copper lining the whole of the tub is made of hardwood. The tub has round corners, molded legs and raised panels, and is fitted with Blessing's all nickel plated Novelty waste and overflow, double compression or Fuller bath bibb and pipes to floor. The tub is made in cherry, ash, oak and maple. Other styles of hardwood tubs are manufactured by Mr. Blessing, having round or square bottoms and corners, turned, molded or carved legs, paneled and plain casings, natural wood finishes, or handsomely painted and decorated, and with and without fittings. All tubs are made in the usual copper weights, 12 to 20 ounces, and in lengths running from 4 to 6 feet. They are also supplied in quartered oak or walnut cases. The tubs are meeting with a good reception at the hands of the trade, and are being specified by architects, particularly for bathrooms where natural wood wainscoting has been used. They are said to be exceedingly durable, and when the linings are worn out they may be easily replaced by new ones.

THE FACTORY of the Victor Company, at Blairsville, Pa., is about completed, and will begin making bathtubs and sanitary ware within two or three weeks.

Sherman's Basin Clamp.

We show in the accompanying illustrations Sherman's basin clamp, manufactured by the H. B. Sherman Mfg. Company, Battle Creek, Mich., and placed on the market through the jobbing trade. Fig. 1 shows the clamp itself, Fig. 2 shows it adjusted to a bowl with thick flange, while Fig. 3 shows

Sherman's Basin Clamp.—Fig. 1.—General View of Clamp.

it adjusted to a bowl with thin flange. The basin clamp proper is made entirely of sheet brass, and from its shape is very strong, while at the same time it presents a neat appearance. One of the most important advantages claimed for it is its adjustability, permitting its use with bowls having either thick or thin flanges, as shown in the illustrations Figs. 2 and 3. In changing the adjustment it will be seen that the plane surface of the clamp offers a flat bear-

Fig. 2.—Clamp Adjusted to Basin with Thick Flange.

ing for the nut on a bowl to be tightened up against. The variation in the clamp is attained by the little yoke or U shaped piece, as shown in Fig. 1, being hung out of the center. This allows of four different adjustments by simply turning the yoke with the fingers, and it will be seen that the change can be made instantly. The yoke is attached to the clamp in a substantial manner. Another feature to which the manufacturers allude is the length of the slit provided for the bolt,

Fig. 3.—Clamp Adjusted to Basin with Thin Flange.

so that if a hole has been drilled out too far for the average basin clamp, as frequently happens with oval basins, the Sherman clamp can be used without trouble. It is pointed out that the adjustments can be made without removing the bolt from the clamp and in a moment's time. The clamp being always parallel with the marble, it is mentioned that it removes the liability of the bolt pulling out of the marble when the nut is tightened up. The Sherman

Mfg. Company will send samples of these clamps free of charge on application.

The Columbus Soap Cup.

We show in the accompanying illustration a general view of the Columbus brass soap cup of a special patented design and made by the Columbus Brass Works, Columbus, Ohio. The design of this cup, it is said, prevents the bad odor or collections of dirt from the soap and water, which is a great source of trouble with cups having a false bottom. The cup illustrated can be cleaned by one stroke of the sponge. It

The Columbus Soap Cup.

is made of either polished brass or nickel plated and can be fastened to the back of any washstand with two small screws.

TRAPS AND VENTS.

McCAHAN & Co., 8 North Central avenue, Baltimore, Md., distribute circulars illustrating and describing some of their gas goods. One of the devices shown is the Surprise gas bath heater; also the Surprise gasoline portable bath heater.

THE GAS FITTING APPLIANCE COMPANY, Newburg, N. Y., have moved into their new store at 62 Second street.

GEORGE MORLIDGE has opened a plumbing shop at 633 York street, Newport, Ky.

F. LENOX AND A. CLEVELAND will open a plumbing shop at Hamilton, N. Y.

In *The Metal Worker* of March 9 appeared an article entitled "The Star Coupler on Supply Pipes" and an illustration was shown of the universal application of these couplers. We accidentally omitted to state, however, that they were manufactured and sold by the Star Coupler Company, 801 Walnwright Building, St. Louis, Mo. If the Star Coupler Company were not so well known to the entire trade the omission would have been more serious than it is.

THE WESTERN GAS FIXTURE COMPANY, Toledo, Ohio, had a small fire last week.

THE BOARD OF HEALTH of Detroit, Mich., have reduced the salary list of the city officials in their department from \$45,054 to \$23,300. To do this a number of employees had to be cut off, and several offices were abolished altogether. The number of sanitary inspectors was reduced from 16 to four, and the garbage department was abolished, throwing out the two inspectors and a clerk. Only one plumbing inspector was allowed, at a reduced salary, and

no clerk. The office of sanitary expert was abolished, and it was not thought necessary to employ a stenographer. The salaries of most of the offices were reduced. The additions include a sanitary engineer, with six assistants, who will look after the inspection of food, milk, plumbing and sanitary regulations. The office of laboratory expert was also established.

A BILL to license plumbers is on its passage through the Legislature of Wisconsin. It provides that no plumber or plumbing firm shall do business without a license, in any city having over 7000 inhabitants. Application must be made to the board of health,

which shall appoint a board of examiners to examine into the qualifications of all applicants, and certify them to the board of health, which shall issue licenses good for one year. Fee \$2 for employing firms, 50 cents for journeymen plumbers, 50 cents for renewals. An inspector of plumbing is also to be appointed, to be a person not interested in the business. Each city of 7000 or over shall also fix by ordinance regulations for plumbing and apparatus to be used, no plumbing except repairs to be done without a permit. Violation of the law is made a misdemeanor, punishable by fine not exceeding \$50.

J. N. HEVEY, Keene, N. H., has taken Walter A. Whitman into partnership in the plumbing and gas fitting business. The firm name will be Hevey & Whitman. The business will be increased by the addition of electric supplies of all descriptions.

JOHN B. KELLY has opened a plumbing shop at 42 Front street, Ballston Spa, N. Y.

THOMPSON & MORRISON, plumbers, Amherst, N. S., have been succeeded by C. A. Luby & Co.

THE BIRNEY PLUMBING COMPANY have been incorporated at Chicago, with a capital stock of \$3000, for general plumbing. The incorporators are C. R. Jones, William F. Henning and C. Woodward.

MCCAMBRIDGE & Co., LIMITED, Philadelphia, have just issued a handsome supplement of 24 pages to their catalogue B, descriptive of their Syphoclosets and urinals. The publishing of the supplement was necessitated by the many additions to the line since the publication of the original catalogue. Many of the styles shown in the catalogue appear in the supplement. A feature of the new styles shown is the method of attaching the seat to the bowl. This is accomplished by means of a solid spindle passing through a sleeve at the back, and forming part of the porcelain bowl. This spindle forms a bearing for the seat mountings, and

makes a safe and durable fastening. The closets are all made of vitreous porcelain and are shown in plain and embossed patterns, with a line of tanks, ornamented and plain, automatic flushing seats, chain and guide pulls, pipes, straps and fittings. Page 11 shows a public toilet room equipped with Sypho closet and urinal. The urinal combination is shown to be of the automatic type, regulated to flush by means of an automatic siphon tank as frequently as desired. The urinal is further described on page 21, and its special adaptability for hotels and public places explained. Page 20 is devoted to Howell's flexible water closet connections, as used on most of the company's closets. Pages 22 and 23 are utilized for detailed price-lists of the different Sypho combinations, and the concluding page is occupied by the company's brass toilet paper cabinet, which commends itself as a finishing touch to the equipment of a modern first class bathroom. The supplement is about 14 x 10½ inches in size, and is bound in buff paper covers.

THE BILL for the registration of plumbers has been again introduced into the British House of Commons in the same form in which it failed of passage last year and in 1893. The prospects of its becoming a law in its present shape are regarded as being very remote. A strong opposition exists to it on the part of many ironmongers who combine a plumbing business with their own trade.

E. A. WEIDNER and J. A. MORGAN-THALER have dissolved partnership in the plumbing business at 230 Wells street, Milwaukee, Wis.

THE STOP COCK COMPANY, 50 Cliff street, New York, issue a neat little booklet entitled "Servants or Masters?" relating to an automatic appliance by which both the water and gas supply to a building can be shut off to prevent freezing, overflowing or other accidents occurring during the night.

THE DALTON INGRESOLL COMPANY, 171 High street, Boston, Mass., are issuing their 1895 supplement to Catalogue "C." It contains 32 pages of fine enameled paper and first-class printing. The second page contains a notice that they will keep any of the water closets illustrated in it in repair for three years if they become inoperative through defect in principle or construction. The first 20 pages are devoted to showing their line of hand action siphon closet and their hand and seat action wash down closets. A sectional view is given of all the different closets showing their construction, also a cut of a floor and wall on which the dimensions are given of the space required to set them. Some of the closets are shown all earthen, others with an enameled iron trap. The bottom of the flush tanks for these closets is just level with the seat, and some are shown with the flush tank behind a partition, and it is stated that in public places the run of soil pipe can be shortened by arranging the closets in two rows with an inclosed space between for the flush tanks and piping. The Puritan enameled roll bath is next shown in connection with a combination needle and shower bath. This bath rests directly on the floor, having no feet. It is followed by several illustrations of combination needle and shower baths in connection with bathtubs and separate. Several styles of siphon tank valves and flush tanks are shown and some bath and lavatory combination fixtures.

THE NEW SHOWROOMS of the Gilbert & Barker Mfg. Company, 83 John street, New York, will be heated by a Champion boiler made by the Thatcher Furnace Company, 240 Water street, New York. The salesrooms are being opened to display their machines for the manufacture of gas and gas appliances for cooking, heating and manufacturing purposes, not the least interesting of which is the new Clark's instantaneous gas water heater.

DUBOIS & DARROW, 61 Gold street, New York, are closing out their plumbing supply business previous to entering into a manufacturing business in another field on May 1.

P. J. HART of the firm of Hart & Shea, plumbers and gas fitters, at 10 Putnam street, Fitchburg, Mass., will open a store at 353 Main street, in Central Block.

TAYLOR & HILBORN, Bucyrus, Ohio, gas fitters and plumbers, will remove about April 1 into the audience room of the old M. E. Church, which will be fitted up for their use.

THE WORCESTER MASTER PLUMBERS' ASSOCIATION, Worcester, Mass., in existence for several years, is now a thing of the past. The organization formally disbanded at a meeting held in the rooms of the Builders' Exchange last week. It was voted to pay all the debts of the association with the funds in the treasury, which are ample for the purpose, and then to sell all the association property, which is valued at about \$200.

THE PLUMBING FIRM of Lealie & Wilson, West Lafayette, Ind., are moving into the room recently vacated by R. N. Goans' candy store.

GEORGE H. STICHTER, an old member of the Reading Baseball Club, has engaged in the plumbing and gas fitting business at 341 South Sixth street, Reading, Pa.

THE PLUMBING BUSINESS conducted by Harper & Westcott, at 27 Howard street, Albany, N. Y., has been dissolved by mutual consent, and Horace F. Westcott will continue the business. He is president of the Master Plumbers' Association of Albany, chairman examining board of master plumbers, and an officer of the State association.

KINGSLAND & Co., Burlington, Vt., plumbers and dealers in house furnishing goods, have disposed of their stock to the G. S. Blodgett Company and will go out of business.

Death of Alexander McKay.

Alexander McKay died last Saturday at his residence, 136 Canfield avenue, East, Detroit, Mich., aged 42 years. Mr. McKay was well known in business and social circles, being the secretary and treasurer of the Park-McKay Company, manufacturers of plumbers' supplies. He came to Detroit from Dutton, Ont., in 1869, and engaged in the plumbing business with Ferguson, Mouat & Co. At a later date he organized the Park-McKay Company. He was a successful business man. The deceased leaves a widow and two daughters.

It is stated that the International Pacific Cable Company, who failed to get a Federal charter from the last Congress, will go ahead with their project of connecting San Francisco, Honolulu, and Yokohama by cable, operating under a State charter.

News and Notes.

The insurrection in Cuba threatens to interfere seriously with the trade of that island.

During the fiscal year 1893-94 the sum of \$3,342,375 was applied by the county and municipal councils in England, Scotland and Wales to the promotion of technical education.

The United States Minister at Madrid, Spain, has reported to the State Department that he has obtained from the Spanish Government an order for restitution in five test cases of claims for excess of duties paid by United States importers into Cuba.

Electricity, according to a Canadian Customs decision, comes under the head of "Unenumerated articles," paying a duty of 20 per cent. when imported into that country. The question recently arose over a proposition to transmit power from the American side of Niagara Falls to adjoining Canadian cities.

The Congress of the State of Nuevo-Leon, Mexico, has recently passed a law exempting from all taxes new industrial enterprises locating in that city in the next two years having a capital exceeding \$1000. The exemption is to last six years, dating from the time when the capital shall be deposited.

A Philadelphia paper states that the Cramps of that city have a contract to build a 20 knot steel steam yacht for an unnamed owner, which will be one of the finest pleasure vessels afloat. The dimensions given are 174 feet on the water line and 200 feet over all, with 23 feet beam and 11 feet draft, and 247 tons burden.

United States Immigration Commissioner Stump has prepared statistics showing that during the past seven months immigration into the United States has decreased 40 per cent.

The British Board of Trade returns for February show a decrease in imports of \$28,080,000 and in exports of \$8,208,000, as compared with those of February, 1894.

The fire losses of the United States and Canada for the month of February, as estimated by the *Journal of Commerce*, aggregated \$12,360,200, an increase over the February figures for 1893 and 1894. The following comparative table exhibits the losses for the first three years:

	1893.	1894.	1895.
January...	\$17,958,400	\$10,868,400	\$11,495,600
February..	9,819,800	11,297,600	12,360,200
Totals..	\$27,778,200	\$22,166,000	\$24,255,800

The lifting of the acute distress which has for a long time prevailed among the settlers in Western Kansas is evidenced by the fact that 12 counties have notified Governor Morrill that they are in no further need of outside aid.

It is proposed to connect Pittsburgh with McKeesport, West Newton and Greensburg by means of an electric trolley line. The Widener-Elkins syndicate, which controls so many street railroads, is said to be at the back of the scheme.

The explanation of a number of suspicious fires which have been occurring in the east side of New York City was found in the exposure and conviction of an organized gang of "firebugs," who were last week awarded exemplary sentences in State's prison.

The S. & W. Drilling Attachment.

We show in the accompanying illustrations the S. & W. drilling attachment manufactured by the Smith & Winchester Company, Boston, Mass., with New York office at 174 Fulton street. The simplicity of the tool is particularly referred to, and the illustrations clearly show its operation and usefulness. The drilling attachment is used in connection with an ordinary bit brace for the drilling of cast iron, steel, wrought iron or any metal which it is possible to drill by any means. The manufacturers allude to the difficulty of keeping a constant pressure where the brace drill is used. With the S. & W. attachment, however, it is stated

the manufacturers as Style A. Fig. 3 shows the same attachment with adjustable chuck for square shank drills and is known as Style B. These drills can be obtained from dealers throughout the country as well as from the Smith & Winchester Company.

The new ship canal between the Baltic and North Seas is to be opened on June 20 by Emperor William of Germany with imposing ceremonies. A naval parade of vessels of war of all countries is announced as a leading feature of the programme. The canal, which has cost \$37,440,000, was begun in June, 1887, and over 8600 men have been employed on the work. It starts at Kiel, on the Baltic Sea, crosses the

manufacturing establishments in the State, with a capital of \$119,667,316 and employing 107,054 persons. Baltimore possesses 5265 establishments, capitalized at \$92,723,677.

The sanitary ware operators, who have recently reorganized for the purpose of resisting any further reduction in their wages, held a meeting at Trenton, N. J., which was attended by operative potters from Baltimore and Ohio, when the constitution and by-laws were adopted, the principal features of which are the obliterating of the individual contract system, fixing a uniform price for each piece of work and prohibiting the manufacturer from taking on any apprentices. The attitude of the men

The S. and W. Drilling Attachment.—
Fig. 1.—Drill in Use.

Fig. 2.—Drilling Attachment, Style A.

Fig. 3.—Drilling Attachment, Style B.

that an inch hole can be drilled with great rapidity through metal of any thickness with no power from the operator except the mere turning of the drill. Fig. 1 shows the drill as it would be used in boring through the flange of an ordinary piece of pipe, and indicates clearly the manner of operating the drill. The device is simple in construction and consists of a spindle to one end of which is fastened the drill, and to the other end the bit stock. Outside of this spindle is a tube having threads on the outer side which pass through the yoke to which the chain is attached and which holds the drill to its work. Attached to this tubing is a small corrugated wheel, and as the drill enters the metal the wheel is turned sufficiently to keep the drill at its work. Excessive friction between the tubing and the spindle is prevented by 12 steel balls which reduce the friction to a minimum. Fig. 2 shows the drilling attachment separate as adapted for $\frac{1}{4}$ -inch round shank drills, and is classed by

province of Holstein and joins the river Elbe at Brunsbüttel, below Hamburg. The length is $53\frac{1}{4}$ miles, average depth 29 $\frac{1}{2}$ feet, width at bottom 72 feet and at water level 213 feet. There will be two locks, one at the Baltic end and one on the Elbe.

At the Charlestown Navy Yard, Boston, Mass., an important test will be made next week of the Ammen ram "Katahdin," to ascertain the vessel's metacentric height; that is to say, to find out her center of gravity and point of water pressure. The test is regarded as being of the greatest importance, and it will be attended by naval authorities from Washington and representatives of the Bath Iron Works, where the ram was built.

A. B. Howard, Jr., chief of the Maryland Bureau of Industrial Statistics, in his annual report for 1894 shows a total of 7485 mechanical and

is stated to be very firm on the question of resisting what they consider further encroachments by the manufacturers.

Lloyd's Register of British and Foreign Shipping shows that 22 British war vessels were launched in 1892, of 137,000 tons; 16 ships in 1893, 40,000 tons, and in 1894, 29 vessels, of only 32,000 tons. In the course of the last 12 months Russia launched 34,850 tons of war vessels and France 28,690 tons. Thus France and Russia between them nearly doubled the output of Great Britain last year.

A dispatch from New Haven, Conn., states that the Winchester Repeating Arms Company of that city made a shipment last week of 2,000,000 cartridges to the Chinese Government. The company are now said to be working on a large additional order for ammunition from that quarter.

The Bliss Deep-Throat Power Press.

Up to a comparatively recent period the use of deep-throat punches was

top of throat, $9\frac{1}{2}$ inches; motion of slide, $1\frac{1}{2}$ inches; size of bed, 16×16 ; standard opening in bed, $8\frac{1}{2} \times 8\frac{1}{2}$; diameter and face of fly wheel, 54×5 ; weight of fly wheel, 900 pounds; speed of fly wheel, 90 revolutions; the com-

No satisfactory explanation as to the cause of the explosion is given. Fire followed the shock, but was kept within the limits of the wrecked block.

Paper Water Pipes.

The experiments with the new paper pulp pipes, which are made on pretty much the same principle as the fiber pail, have demonstrated to the satisfaction of the *Paper World* that the idea will eventually prove successful. As it now stands, the hand made pipes, formed from crudely worked and irregularly subduced pulp, are not very attractive in appearance nor well enough made to warrant that they will stand the wear and tear to which street water pipes are subjected. However, it would be more of a wonder if the plan of making the water pipes should be a booming success from the start. Time and experiments are essential to the development of all new things. With each new test of the proposed pipes a step in advance is made, and this would seem to indicate that after a few more trials perfection will have been attained. The matter as it now stands is about as follows: Paper pulp, in which there is a fairly good fiber, is agitated with water and run into molds and cast into the form of the ordinary water pipe. The same molds that are used in connection with casting iron pipes are employed. The mode of procedure is substantially the same. Of course there are various strengthening materials compounded with the pulp, otherwise it would not stand a great pressure. The inventors report that these ingredients are inexpensive and simple.

The Bliss No. 78 Deep-Throat Power Press.—Fig. 1.—General View of Press.

almost entirely limited to the punching and shearing required in bridge, railroad and structural iron work, which does not often call for the accuracy and adjustments needed in working blanking, perforating or forming dies on thin sheet metals. Within the last few years, however, much of what had previously been done by hand in the production of stoves, wrought iron ranges, zinc work, &c., has been brought within the range of die operations, calling for a press which combines a deep throat with the necessary accuracy and adjustments. The press shown in Fig. 1 was designed by the E. W. Bliss Company of 11 Adams street, Brooklyn, N. Y., for this purpose.

Its punch slide is guided and gibbed so as to secure accurate cutting and is provided with an eccentric adjustment permitting it to regulate with precision and ease the exact point to which the punch is to descend. The exact nature of this eccentric adjustment is shown in Fig. 2. It can be brought into any needed position by simply turning the pinion wrench shown after having loosened the clamp bolt. The pressure is in this manner always taken on solid metal instead of falling on screw threads. The action of the press is controlled by means of a treadle which operates an automatic clutch, so as to insure the stopping of the slide at the highest point of the stroke. This machine is mostly made as a fly wheel press, but for work requiring a slower and more powerful action it is provided with back gearing. It is also frequently furnished with stay rods so as to fit it for heavier work where a great depth of throat is not needed. The principal dimensions are as follows: Depth of throat, 24 inches; distance from bed to

plete weight of press, approximately, 5500 pounds.

The most destructive natural gas explosion in the history of the Indiana gas

Owing to the largely increasing Pacific Coast traffic of the port of San José, Guatemala, the Government of that republic, says the Bureau of the American Republics, is taking steps to re-establish the old port of Istapa, situated about six miles from San José. It is proposed to construct a harbor there

Fig. 2.—Eccentric Adjustment.

belt occurred at Anderson, Ind., at an early hour on the morning of March 5. An entire business block, situated on the Court House square in the center of the city, was literally blown to pieces, causing a direct loss of about \$400,000.

capable of accommodating about 100 vessels, and also to build a branch railway to the port from some point on the Central Railway, thereby relieving the condition of congestion which now prevails in the neighboring port.

TIN PLATES.

SCRAP.

A DISPATCH from Alexandria, Ind., to the Cincinnati Commercial Gazette states that a tin plate factory is to be erected in that locality which will employ about 400 men. The plant is to be on a large scale, covering 216,000 square feet.

FOLLANSBEE BROS. COMPANY, successors to James B. Scott & Co., Pittsburgh, Pa., issue a seasonable circular with the rubricated head-line, "Spring is here." This prefaces the cheering statement that signs point to an improvement in business. The purpose of the circular is to call the attention of the trade to the various well-known brands of tin andterneplates which the firm handle. These include Scott's Extra Coated, Triumph Old Style, Orbit Old Style, Duquesne, Neville, Pittsburgh and Raymond roofing plates, and Blairsville best bright, Clifton, Conemaugh and furnace bright plates. Attention is also directed to their assortment of sheet iron and their stock of tinners' tools and machines.

REPORTS of projected tin plate plants are constantly being published, particularly in connection with various towns in the Indiana gas belt. While some of these are undoubtedly bona fide enterprises, we are advised that others are being promoted merely for the purpose of booming town lots. These items of news should therefore be taken with a certain amount of caution.

THE recent labor difficulty in the American Tin Plate Company's works, Ellwood, Ind., when 50 men in the cold roll department struck for a change in the system of payments, has been adjusted by the company granting the request of the men, and 750 hands are reported to be now at work.

PLANS are reported to have been completed for a third tin plate plant at Ellwood, Ind., to be built by Chicago capital. Work will be begun on the buildings about the middle of April and the plant is expected to be ready for work by October. About 300 men are to be given employment at these works.

BRITISH CONSUMERS are complaining, through the columns of their trade journals, that while the prices of tin plates for export are lower now than at any former period, they are called upon to pay as much for their plates as they paid a year or two years ago, notwithstanding the fact that steel bars and pig tin are both considerably cheaper now than they were at that time.

N. & G. TAYLOR COMPANY's tin plate plant in Philadelphia is reported to be working steadily, not having been affected by the ups and downs of the trade. The demand for their standard brands is such as to oblige them to increase their facilities. The firm, we understand, are now completing the erection of two new stacks, which they expect to have working within a week. Notwithstanding the exceptionally hard winter, which has its effect upon tin house work, the Taylor plant has been running steadily, with the assurance of a good business for their goods the com-

ing season. The company advise us that their genuine Taylor Old Style roofing plates are increasing in sale, as the old roofs covered with this brand testify to its durability.

E. E. ERICKSON, Pittsburgh, Pa., has a contract to erect a new tinning stack for the Pittsburgh Tin Plate Company, New Kensington, Pa.

THE WELSH TIN PLATE MANUFACTURERS seem to be still hankering after an agreement whereby they can arrange to materially advance the price of tin plates. The Iron and Steel Trades Journal of London intimates, however, that it is the owners of tin plate works in Wales, who are also interested in American works, who are endeavoring to entice the Welsh makers to combine to raise the prices. There is, however, a strong feeling against those who have these dual interests, and the Welsh makers are, on the whole, inclined to agree that their best friends are not those who are interested in the American tin plate industry.

THE BRITISH BOARD OF TRADE RETURNS for February show that 33,000 tons of tin andterne plates were exported from Great Britain during the month. Of this amount 23,000 tons were shipped to the United States, against 18,000 tons in the previous month and 13,000 tons in January, 1895.

THE FRANK-KNEELAND MACHINE COMPANY, Pittsburgh, Pa., manufacturer of iron and steel works machinery, have received a contract from Reeves Iron Company, Canal Dover, Ohio, for four double tin mills with 24 x 30 inch rolls, four cold mills 22 x 34 inch rolls, two doubling and one trimming shears.

THE PLANT of the Crescent Sheet & Tin Plate Company, Cleveland, Ohio, is nearing completion and is expected to be ready for operation about May 1 next. At the start out the concern will make black plates, although a tinning department will be added later on. The plant will cost, when completed, about \$150,000, and is expected to turn out about 20 tons of black plates per day. The hot mill will be 175 x 75 feet, and will be driven by two engines, 34 x 72 inch. There will be a 10-ton and a 5-ton electric crane and other machinery, including a dynamo. The tin house will be of steel construction, 105 x 165 feet, with a wing 48 x 48 feet. It will contain ten tinning stacks. The annealing house, with pickling machines and other equipment, will adjoin it.

The tin plate manufacturing firm of Griffiths & Cadwallader, Pittsburgh, Pa., have been dissolved, and the business is being continued by C. W. Cadwallader.

THE NEW PHILADELPHIA IRON AND STEEL COMPANY, New Philadelphia, Ohio, manufacturers of black and galvanized iron and steel sheets, are making important improvements in their plant. Until the middle of January this concern were operating four hot sheet mills with a large Corliss engine, which worked satisfactorily when rolling iron sheets with 22-inch diameter rolls. Large orders for steel sheets of

the finer gauges have constantly been coming in, and the firm have decided to double their power, and are now putting in a pair of 32 x 48 inch Geo. H. Corliss engines, a new and heavier fly wheel, two sets of steel gear wheels, a set of 24-inch rolls, and will considerably increase their cold rolling capacity. The New Philadelphia Iron and Steel Company have six hot sheet mills, two cold rolling mills, bar mill and galvanizing plant. Two of the sheet mills and the bar mill are running right along, and will be kept in operation during the time the improvements and repairs are being made. They are operated by a pair of poppet valve engines. An electric crane and lighting plant are also being added. When the improvements are completed, which is expected to be about May 1 next, the plant of this concern will be one of the best equipped in the country, and when running to its full capacity will be able to turn out about 1400 tons per month of iron and steel sheets from No. 12 to No. 30 gauge and suitable for all purposes.

A NUMBER OF IMPROVEMENTS have recently been made in the plant of the Falcon Iron & Nail Company of Niles, Ohio, manufacturers of iron and steel sheets. A continuous rolling mill has been added to the equipment.

THE STAR TIN PLATE COMPANY, Pittsburgh, Pa., have made application for a charter of incorporation. The incorporators are: James Hemphill, William Wade, Pennock Hart, William F. Dutton and Joseph Fawell. The plant of the new concern will be located on Twelfth street, below Penn avenue, Pittsburgh, Pa. The foundations for the hot mills have been under way for some time and are almost completed. The concern will erect eight hot mills and they will be driven in pairs. Three pairs will be driven by 42 x 60 inch automatic cut off engines and the other two hot mills will be driven by a 28 x 48 inch Corliss engine. There will be six cold mills, and these will be driven by a tandem compound engine with 28 inch high pressure cylinder, 50 inch low pressure cylinder and 60-inch stroke. There will also be the necessary annealing furnaces, shears, pickling vats, &c., and it is expected to have the plant in operation on the manufacture of black plates for tinning purposes about July 1, with a capacity of about 50 tons of black plates a day. It is the intention of the firm to add tinning sets later on and to engage in the manufacture of both tin andterne plate.

H. V. B. NASH of the tin plate firm of T. B. Coddington & Co., 27 Cliff street, New York, left for Europe last Saturday on business connected with the estate of his father, the late Henry Nash of Liverpool, whose sudden death was recorded in these columns last month. Mr. Nash expects to be absent for about a month.

THE MONTHLY STATEMENT of goods in bonded warehouse in New York City shows that 66,940 boxes of tin plate were so held there on February 28, as compared with 76,353 boxes on the same day last year.

STOVE TRADE NOTES.

Foundry Mixtures for Stove Castings.

The most economical and serviceable mixture of irons is the great point sought by the foundry manager. In this matter experience is worth a great deal, but the experience of any single manager is not nearly so instructive as would be the experience of many managers combined. In the hope of securing information from some of the practical men connected with foundry management we print below a letter recently received from a stove manufacturer who has had trouble with his foundry mixtures. The difficulty may be due to the proportions of different irons which he has used. We know that he would be much indebted to any one who could suggest wherein the difficulty lies, and we know the trade would be greatly interested in a discussion of the proper mixtures for stove castings. We print his letter as it is received:

We send herewith a mixture of iron which we have been using without good results, and we would be very glad if some of your practical readers would suggest a remedy. The mixture is as follows:

Thirty-nine per cent. of the pig iron charge is good grade No. 2 Southern Foundry.

Thirty-eight per cent. of the pig iron charge is good grade No. 3 Southern Foundry.

Sixteen per cent. of the pig iron charge is good grade No. 1 Southern Soft. Seven per cent. of the pig iron charge is Jackson County Silvery, carrying 8 per cent. silicon.

As a matter of course, all of the Southern irons are of different brands. By that we mean they come from different furnaces. With the above we use our own scrap, and with each ton of iron charged we add 30 pounds of limestone as flux. This mixture makes an iron that has a great deal of dirt in it, and after the iron is melted and in the ladle there is a quantity of dirt that rises and has the appearance of rust. It is not slag; it simply resembles rust, and it is impossible to skim this away, for as fast as one lot of rust is skimmed there is another lot which takes its place. When the iron is poured and any of this rust gets in the mold the result is a rather mean appearing casting. I would like to know what to do to clean this iron and to do away with this rust dirt.

AN INTERESTING FIGURE passed away this week in the person of John L. Gill, one of the pioneers of the West, who died in Columbus, Ohio, at the age of 90 years. In the year 1827 he took four six-horse wagon loads of stoves to Athens. On the trip he observed a blacksmith using coal which, on inquiry, he found to have been dug from the adjacent hills. Gill made arrangements with the blacksmith to dig sufficient coal to load the

teams on their return trip, which coal he sold on arrival at Columbus at the rate of \$15 per ton. This was the first coal ever brought to Columbus for manufacturing purposes from the Ohio Valley, and was the beginning of the immense coal industry of that region.

Gasoline Stoves.

The gasoline stoves that are being marketed this year are more attractive in construction than formerly, and now that their operation is simplified and their use is fully understood it will not be surprising if the year closes with the announcement of the same increase in sales as has been customary. The intense heat of which they are capable has been very pleasing to the always busy housewife, and their efficiency is reported and witnessed with an interest that makes the possession of a gasoline stove a mere matter of time in numberless cases. Like all apparatus of high power their misuse is capable of destruction, but modern improvement has reduced the danger to a minimum. As a farmhouse and suburban apparatus for summer use its popularity is undivided in many sections. Some discouragement has been met through the insurance companies, but liberal and up to date business companies will include the right to use gasoline stoves of approved construction in their policies. The season for their use is not so far removed that the live dealer can put off selecting his line, and the outlook is far more promising than for the past few seasons.

Brand's Catalogues.

The Brand Stove Company of Milwaukee, Wis., and 77 Lake street, Chicago, have just issued two handsome catalogues, one referring to oil and gasoline stoves, oil and gas ranges and oil heaters, while the other treats exclusively of furnaces. The goods enumerated in the first catalogue cover Brand's Famous gas range, which is made in two sizes and is constructed entirely of cast iron; Famous Junior gas stoves and hot plates with one, two and three burners; Famous oil ranges, with four 8-inch cooking holes; Famous oil cooks, with one, two and three cooking holes, in various styles; lamp stoves with one, two and three burners; Famous All-Right oil heating stoves in three styles and sizes; Famous gasoline stoves, comprising low juniors, high juniors and high juniors with step, all having individual burners, and the same styles with single generators, either with stationary, safety or lay-down tanks. It will be seen from this statement that the company are well equipped to supply the trade with hot weather cooking apparatus.

Their furnace catalogue illustrates

and describes a larger line of warm air furnaces than ever before shown by the company, to which they have added combination warm air and hot water heaters. Their furnace department has now been expanded into a specialty. The construction of the company's well-tried Wisconsin cast iron furnace is fully set forth, followed by the new construction with steel radiators, and a large number of wrought iron cylindrical flues to increase the heat radiating surface. Another new series of furnaces is named the Famous Florida. This is a base heating furnace with a steel dome and low radiator, increasing the distance traveled by the products of combustion, and securing the utmost amount of heat from the fuel burned. Other furnaces shown are the Famous Comet, with steel dome, and the Famous Magnet for wood. An illustration is given of Bigley's patent hot water heater, designed for the conversion of warm air into combination furnaces. This hot water heater is cone shaped, sits on top of the fire pot, is made of cast iron in two pieces, and presents the appearance of open pipe work, the interior being arranged with partitions between heads so as to cause reverse circulation of the water passing through the heater. It is tested to 150 pounds pressure, has two inlets and two outlets, and is intended to add to the heating capacity of a furnace with little additional expense for fuel.

Florida as a Market for Heating Stoves.

BY JEEMS.

I was down in that flowery land during what they call the "second freeze," and part of the time was domiciled in one of those lovely Southern houses filled with all the Southern appliances for keeping warm, or, at least, for keeping out the warm, and in doing the latter the house was a perfect success. No warm ever got near that house, for the air froze before it struck it, and came into the rooms in regular ice chunks. I always was, and ever will be, the lover of a good stove, and when you have got the institution glowing on a cold day, and you feel its genial warmth while the wind howls outside and the pedestrians buck along against the blast, you feel how much you are thankful to the thoughtful stove man.

I never before had such a chance to enjoy the luxury of an open fire—the pretty tile, the tasty mantel, the fluted brass trimmings and then the cheery blaze, as they called it. Great Scott! I bet I had a blaze in that chimney 40 foot high. Me and another nigger took regular watches to see that the cheery blaze was kept up. We had a dead sure thing on the blaze, but the heat we got out of it had no effect on this "second freeze," as the fire froze from its effects.

Standing with my back to this fire, and clad in a long ulster, I had to tie a sash weight to the tail of the ulster to keep it out of the blaze, the suction was so strong. How I did long for the stove around the boss' shop!

The reputation of Florida as a winter resort, free from all the rigorous accompaniments which attend the sort of weather that the North gets during the period that the stove men reap their harvest, I should imagine is rather shabby.

There ought to be a big business done in stoves through Florida next winter, for if ever a people needed them the inhabitants of this sub-tropical region do; and if a lot of hustlers started a house to house canvases and expatiated on the great advantages of the good old stove and the danger of freezing to death if they have another freeze, a tremendous business could be done. Every orange tree, or at least every three trees, ought to have a stove all ready to light when the sub-tropical winter sets in, for the truth is a sub tropical winter is a corker and not favorable to the orange crop; but with the stove attachment orange growing would be a success. The sub-tropics is the outlet for the stove surplus. Think of it! There must be a million or two of orange trees, and a

recommended; then the doctors' bills; how much each has paid and how good or bad their doctor is, &c., &c. It is so pleasant to hear people describe all their agonies and what they endure, and it is astonishing how they will prolong the narrative to make it interesting for you. It is about as amusing as the dentist when he is running a machine shop in your mouth. Then they all have their prejudices as to the healthiest districts in Florida, and I should judge by what I heard that 300 or 400 yards difference in location would kill or cure a person, according to how he struck it.

The orange fends are just as bad, for their ideas differ largely regarding this fruit and the best method of culture. As I had no disease or orange groves, and in fact don't care about either, I escaped from the crowd as much as possible, and made friends with the cook, getting points on his art when the weather was smooth.

But there is one thing to be said for Florida, and it applies to the South

a nominal price, and think of the immense Western irrigation schemes to bring land under cultivation and the cost of such projects, it is surprising that the course of empire is not more southerly. Ocean voyagers usually go in raptures at the beautiful bay of New York, and think how charming it looks as they sail up the bay. I thought so, too, when I saw the ice floating around, the hills crowned with snow and the nice snug looking houses all fixed up with good heating appliances, and in fancy I could see the people sitting around the good old stove; yes, I could imagine the family cat and the family dog dozing around and enjoying its comforts; it made one feel very jolly, and to think of giving up these good things for a winter in Florida! In the language of the minstrel, "How foolish!"

The Rockford Grate.

The Rockford Grate Company of Rockford, Ill., are offering the trade, an

The Rockford Grate.—Fig. 1.—Front View of Grate No. 203.

Fig. 2.—View Showing Construction of Shaking Grate, Brick Sides and Back, and the Double Draft Dampers Closed.

half million of people who need stoves—that's about the size of it—and there is at least a million stoves wanted. "There's millions in this scheme" for stove foundries and a big field for the inciters of public interest in them.

The sea trip from New York is a very pleasant one when it is "smooth all the way down just like the North River." When it isn't, and usually it isn't, it is not so pleasant. It is like fishing; "if you had been here yesterday you would have struck luck," so the boatmen tell you. So with the steamer—"last trip was as smooth as glass, but this is the worst we ever had." So you take the chances on the briny, but as a mine of information on diseases and oranges the Florida steamship is the place to acquire instruction. Most of the passengers are going down for their health or to look after their orange groves, and between puking, if they are seacick, they will load you up with a detailed account of their ailments or give full instruction regarding orange growing. It is really delightful to get into one of the medical groups and hear of the wonderful remedies and the cure alls that are

generally. People who will take Northern comforts and fit themselves for unpleasant weather can be as comfortable as they could wish, and while tropical agriculture may not be a sure thing (except with the stove attachment), other crops can be made. Up around Quincy and Tallahassee tobacco raising is carried out on a large scale. The Owl Cigar Company of New York have some 1800 acres of land at the former place, and are raising a fine grade of tobacco. They have a large cigar factory and heavy capital invested in the enterprise. Fuller's earth has been found by them, and is being mined and shipped North. This earth has always been imported, and no doubt exists but what there is lots of it in Florida. The climate is healthy, soil good, ground high and rolling, good water and living and land cheap in this section. Eggs 15 cents per dozen, chickens 25 cents, turkeys 75 cents each, dressed hogs 6 cents per pound, &c. Quincy has just contracted for water works, as they have an excellent quality of water. When you consider the vast quantity of well watered land that can be had for

interesting assortment of grates of rich and artistic design, all of which we understand are copyrighted. This grate has interchangeable parts, so that either a shaking or dumping grate and any frame or summer front desired can be used. The back is cast in one piece, but the top and dampers are removable. This, it is claimed, prevents cracking from intense heat, while the parts can be readily replaced if for any reason such a course should become necessary. By means of double flue chambers all difficulty with the draft is claimed to be avoided, and as the coal front is double all ashes and cinders fall through the space between them to the pit behind the ash screen. This is a feature which cannot fail to be appreciated by careful housekeepers, especially if they have had experience with grates from which the ashes were scattered over the hearth. The grate is regulated much the same as a stove, and as the designs are rich and artistic they form a pleasing addition to the appearance of the rooms in which they may be placed. In Fig. 1 of the accompanying illustrations we show what is known as the

company's No. 203, measuring 30½ inches wide and 80½ inches high. The frame is made in one piece and the back and sides are of fire brick. It has a double damper in front, a double basket front and an adjustable summer front. In Fig. 2 we present a view with the front removed, showing the construction of the shaking grate, the brick sides and back and also the double draft dampers closed. We understand the Rockford grate is offered to the trade as a decided improvement upon the old style, and one that overcomes many of the objections often urged against open grates. All the parts are fitted and put together at the factory, and each grate is boxed ready to put in position.

ODD PLATES.

A VARIETY of elegant mantels and fire places are on exhibition at the show-rooms of W. Jackson's Sons, 246 Front street, New York. Mantels are exhibited that have been specially designed for use in halls, libraries, parlors and chambers and adapted to all styles of architecture. They are made of oak, ash, maple, curly birch and some finished in white and gold. Some are shown with beveled French plate glass mirrors, and others, very handsome, are built of tile, red earthenware and terra vitrea, plain and with deep recesses above the fire place bordered with artistic wrought iron or castings of iron and brass of appropriate design. The mantels serve to show seemingly unlimited styles of fire places and grates for coal, wood and gas, some fitted with andirons and others with logs and baskets. Some of the fire places are lined castings bearing ornamental designs of conventional, artistic or special character. Others are built entirely of tile, affording an opportunity for a grace of contour and a considerable license in coloring. Onyx, Sienna and Rose Numidian marble and glass mosaics are used as borders for the fire places with splendid effect, and having ornamental bands of brass and iron. The fire baskets and portable grates are adapted in style and ornamentation to their surrounding; some lusterless, others bronzed and plated or of cast brass or wrought iron. The andirons are in themselves a fine show, wrought iron being worked into fantastic shapes and into dragons or in rugged simplicity; brass is used cast, spun and stamped, highly polished or in antique finish in different colors and sometimes gold and silver plated. The shafts are made round and square, straight and taper, plain and fluted, and of onyx and marble surmounted by wreaths, urns and various ornaments. The fenders are of equal beauty and unlimited variety. The fuel holders, hods and fire sets seem too handsome for use. The summer pieces for fire places are art castings, "A Japanese Minstrel" and "Sans Souci" being notable. The gas grates and logs make a fire place an unalloyed pleasure and are in keeping with the other lines, which make a visit to the showroom something to be undertaken by every one who is able to do so.

THE FERROSTEEL COMPANY, with office and warerooms in Cleveland and with foundry at Chagrin Falls, Ohio, have issued a rather unique pamphlet entitled "Blue Book for the Register Trade." It consists of a number of pages of varying shades of blue printed in blue ink and bound in deep blue covers with embossed side title in old gold. The matter consists of illustra-

tions and price-lists of Ferrosteel warm air registers and ventilators, numerous designs being shown covering Moorish, Byzantine and Composite Lattice patterns. All styles of registers can be supplied finished in white or black japan, electro plated in nickel, copper, bronze, silver, brass and solid brass or bronze metal. The company carry a large and well assorted stock at their warerooms, 17 and 19 Long street, Cleveland. They request that all correspondence be addressed to them at 106-108 Superior street, Cleveland, Ohio, where are located their main offices.

THE BELLAIRE STOVE COMPANY of Bellaire, Ohio, are now running their works four days a week instead of three as previously.

T. B. HUSKEY & SONS of North Berwick, Maine, are very busy getting out goods to meet the spring demand. Owing to the fire which destroyed a portion of their plant, manufacturing operations were checked to some extent, but the work of erecting the new buildings is being rapidly pushed forward and it is expected that everything will be running smoothly in a short time.

THE LEXINGTON STOVE FOUNDRY, at Lexington, Ky., resumed operations on Thursday, March 7, under the management of assignee O. W. Snyder.

THE PENINSULAR STOVE COMPANY of Detroit, Mich., favor us with circulars illustrating their line of wrought steel ranges and also their Silver Peninsular and Bronze Peninsular ranges, the last two being entirely new constructions and brought out to meet the popular demand for satisfactory goods at low prices. They are made for burning wood and are offered the trade in a number of sizes and styles. Each stove has six boiler holes and the ornamentation is of an attractive character. The company have recently established an agency for their furnaces in the western part of the city under the management of Samuel J. Genilloz & Co., 1330 Grand River avenue, Detroit, Mich.

THE PLANT of the Cortland-Howe Ventilating Stove Company, at Cortland, N. Y., has resumed operations, after the usual shut down for repairs and inventory.

THERE is said to be some prospect that the foundry of Burdett, Smith & Co., at Troy, N. Y., will resume operations this spring. It has been idle all winter, but trade has been improving in different parts of the country, and it is now thought that the stove foundry will soon be started again.

THE STANDARD RANGE & STOVE COMPANY were formed a short time since at Terre Haute, Ind., with a capital stock of \$50,000. The meeting was held in the store of the Townley Stove Company, at which time officers and directors of the new concern were elected. The purpose of the new organization is the manufacture of stoves and ranges on a large scale. What is known as the old King plant will be utilized for a time, but subsequently the works will be enlarged, as the company own several feet of ground not yet built upon. It is also stated that if the demands of business should warrant it, a new site will be selected and a large foundry erected. The Board of Directors consists of H. P. Townley, E. J. King, M. J. Hynes, B. G. Hudnut, William Donoghue, George S. Zimmerman and S. L. Fenner. The directors then held a meeting and elected H. P. Townley president; E. J. King, vice president; M. J.

Hynes, secretary, and W. E. Donoghue, treasurer.

THE CRAIG REYNOLDS FOUNDRY COMPANY of Dayton, Ohio, and with Western branch at 82 Lake street, Chicago, Ill., have just issued an interesting publication, entitled "The Triumph Estimate Book." It is issued for the use of the trade and in the hope that it will prove of service in keeping a more systematic record of estimates on furnace work and data connected therewith. Among the opening pages we find some remarks relative to estimates and adjustments, sample blank of proposal and specification for furnace work, together with tables showing the sizes, weight, dimensions, capacities, &c., of the various kinds of Triumph heaters made by the company. Some of the pages of the book are ruled in such a way as to cover the various items necessary, while other pages are left blank for memoranda. The volume is arranged with a great deal of care and seems to meet a pressing need of the trade.

THE SPEICH STOVE REPAIR COMPANY, who were recently formed at Milwaukee, Wis., with a capital stock of \$50,000, have the following officers: President, Albert Speich; secretary and treasurer, Jesse C. Bradley. The new concern succeeded to the business formerly conducted by Albert Speich and Speich & Bradley, both of whom dealt in stove repairs and stoves. The new concern will occupy a five story double store at 130-132 West Water street, and we understand it is their intention to largely increase their facilities so as to make the company one of the largest in the country in their particular line.

THE JOLIET STOVE WORKS of Joliet, Ill., are calling the attention of the trade to Moore's air tight heater and Moore's Extra cook stove by means of prettily decorated blotting pads. These are printed in colors and carry, in addition to advertising matter relative to the goods named, a calendar for the month of March.

THE ROCKFORD GRATE COMPANY of Rockford, Ill., began business a short time since, manufacturing artistic fire place furnishings. They first turned their attention to coal grates and have already brought out quite a large line of fine grates in which many improvements have been made on the ordinary club house grate. They have just issued a neat catalogue of 16 pages illustrating the several styles thus far brought out. The company are now at work on a line of gas grates.

CHARLES NOBLE & Co., Philadelphia, are putting on the market several new ranges of handsome design and replete with modern conveniences. The Home Liberty is an elevated boiler range especially adapted to the requirements of builders. It is supplied in portable and brick set patterns with right or left hand ovens and fire boxes, with or without pipe shelf, upper and lower warming closets and attachment for heating upper rooms. The Prize Liberty is similar in most respects to the Home Liberty, but is particularly for use with a vertical boiler. The Best Liberty is another range of the same order, but designed for a brick setting. All these ranges are supplied with either five or six holes, open or closed ends, and, when required, with skirt base and feet. The firm are improving their well-known Iron King range by the introduction of a bracket reservoir, and the old style reservoir attachment is being ornamented to harmonize with the oven door.

BEARING the ever defiant rooster on its red cover, a 32 page catalogue reaches us from Sam S. Utter, 113 Beekman street, New York. It is printed in blue and the introductory is characteristic. The first 18 pages are devoted to the Game and Summer Girl lamp stoves, followed by a page on the musical line, Solo, Duet, Trio and Quartette lamp stove. Then comes the New Game cast iron cooking stove with two, three and four hole tops, heating drums and ovens, with the Bantam Game and the Parlor Game oil heaters. Several pages are devoted to the Game gas hot plates and sad iron heaters. The last pages show Sam S. Utter's patent wick tube, which is made in one piece without a seam, and give directions for using oil stoves to get the best results.

*RREEVES & SMILEY, 129 North Second street, Philadelphia, have been appointed sole selling agents for the stoves and ranges made by the Plymouth Foundry Company for the States of Pennsylvania, New Jersey, Delaware and Maryland.

A FRENCH CONSULAR REPORT from the Cape of Good Hope states that gas stoves are being largely adopted in that colony in every place where gas is available. There are about 800 now in use in Cape Town.

"A Few Natural Gas Burner Facts Worth Considering" is the title of a little pamphlet from the Hollands Mfg. Company, Erie, Pa., giving cuts and descriptions of 74 different sizes and designs of gas burners for use in cooking and heating stoves and hot air furnaces.

THE EXCELSIOR MFG. COMPANY of St. Louis, Mo., have just brought out the New Charter Oak four-hole cook stove, of attractive ornamentation and substantial construction. It is provided with wire gauze door, but the arrangement is such that it can be changed from gauze to solid door by simply closing the gauze by means of a fan shaped register or sliding plate. This scheme of construction permits the air to be admitted into or excluded from the oven at pleasure.

A. L. CANFIELD, at Pearl and Beekman streets, the New York manager of the Danville Stove & Mfg. Company, Danville, Pa., is making a display of seasonable goods in the line of Monarch gas and gasoline stoves. The Royal Monarch gasoline stove is of the cabinet style with a drop oven door and a special adaptation of the new process burner. Their No. 14 Monarch is a family stove of the single generator type, and has a special feature in a sub-flame under the generator burner. After the stove is once lighted the sub-flame can be put out, to be lit again when the regular burners are shut off. The sub-flame then consumes a small quantity of fuel, keeping the generator warm ready for lighting the burners at any time. The Royal Monarch gas stove presents a handsome appearance in a black japan body, which is brightened with heavy bands that are polished and nickel plated. The burner of this stove presents some new features similar to those, it is said, used in the construction of the central draft lamps. Another feature of the burner is the construction of the needle valve governing the supply of gas. The tapering needle point does not taper all the way to the full size of the valve rod, but tapers more sharply and ends in a shoulder. This shoulder fits up against a seat and prevents the opening around the needle point from becoming enlarged by frequent use.

RATHBONE, SARD & Co. have been running their stove works at Aurora, Ill., on full time, with a full force of hands, since March 1. Prior to that date they ran on part time with a reduced force. This resumption of activity shows considerable faith in the future.

B. W. DODSON, who was for years a prominent and very popular member of the stove trade, is now secretary and treasurer of the Geneva Washed Gravel Company, Ogden Building, 38 Clark street, Chicago.

THE DETROIT VAPOR STOVE COMPANY have been incorporated at Detroit, Mich., with a capital stock of \$150,000. Incorporators are John S. Sherman, Edwin G. Mummery and George H. Harms.

THE HEALD FARQUHAR FURNACE COMPANY have incorporated at Des Moines, Iowa, with a capital stock of \$10,000. Incorporators are W. J., A. W. and I. Heald.

WILLIAM H. SARD, vice-president of Rathbone, Sard & Co., has abandoned Chicago temporarily and will take a few weeks' vacation in Florida to recuperate after a severe struggle with the "grippe."

KIECHLE, BRENTANO & OBERDORFER, proprietors of the Southern Stove Works, at Evansville, Ind., have adjusted the labor troubles in their works and everything is again running smoothly. According to an interview with August Brentano of that firm, published in a local paper, the difficulty originated in January when the molders refused to work on a Franklin stove which they claimed was a "strike" job. All but 11 stood firm when the issue was finally presented to them to go to work on this stove or leave the premises. Non-union men were then employed, and the 11 old hands were so harassed by the strikers that they were obliged to quit. The works then ran wholly non-union. On the 4th inst. G. F. Valentine of San Francisco, vice-president of the International Molders' Union of North America, called on Mr. Brentano, and after a thorough discussion of the situation a method was found through which the differences were adjusted. Mr. Brentano says in conclusion: "The matter is now settled to the firm's satisfaction in every detail. The firm are in far better condition in regard to their rights and privilege in our works than we were before the strike occurred. We now know what we are doing. Heretofore our employees ran our business, and hereafter we will run it ourselves and to suit our own fancy and in accordance with the new management. You might add that we will have nothing to do whatever with the local union. Our contract is made solely and directly with the International Molders' Union of North America. The union men have paid all the non-union men's transportation out of the city, or taken them into the union. The union force will work for us commencing Monday morning. I engaged 50 molders to-day, including the 11 who stood by me in time of need. There is no reason why these men should not continue their work, as Mr. Valentine admitted to me that the men, our employees, alone were in the wrong."

THE FERGUS FALLS SHEET METAL WORKS have been started at Fergus Falls, Minn., by Charles Featherstone, who will manufacture the Surprise heater.

THE FULLER-WARREN STOVE COMPANY of Milwaukee held their annual meeting on the 6th inst. and elected the following Board of Directors: Walter P. Warren and G. G. Wolf, Troy; H. A. Viets, John E. Hausen, Wm. Plankinton, Francis Hinton, H. S. Haselton, Geo. L. Graves and John Johnston, Milwaukee. A satisfactory year's business was reported, taking general trade conditions into consideration.

THE NEW BUILDING which will soon be erected by the Cleveland Steel Range Company of Cleveland, Ohio, will be 50 x 192 feet and three stories in height. The main entrance will be at the corner of Detroit and State streets and constructed in the shape of an alcove. The offices will be located on the first floor of the Detroit street front, while the storerooms, laboratory, shipping and erecting rooms, together with the engine and boiler room, will occupy the remaining portion of the floor. The second and third floors will be used for manufacturing purposes. The rear of the proposed building will front on Vermont street and there will be a double door entrance on Vermont and State streets. The estimated cost of the new building is placed at from \$15,000 to \$20,000.

"THE FRIEND OF THE FAMILY" is the title of a little pamphlet which comes to hand from Buck's Stove & Range Company of St. Louis, Mo. The opening pages consist of a talk on stoves, covering their selection, use, attachments, &c. The pages then describe how to make candy of various kinds, the recipes being presented very full and complete. The illustrations and compilation are by Bert Ball.

THE PORTLAND STOVE FOUNDRY COMPANY of Portland, Maine, have just issued a very neat four page folder printed in colors and calling attention to their Atlantic hot water and warm air combination heater, which is offered the trade in numerous sizes. The device is shown in sectional view, clearly indicating the internal arrangement of parts, while the descriptive text calls attention to the leading features of merit. Illustrations of several dwellings heated by the company's system are also presented.

FRED E. LEE, manager of the estate of P. D. Beckwith, Dowagiac, Mich., writes us under date of March 5 that after a two weeks' shut down the Round Oak Stove Works resumed operations on Monday, February 25. The works have been running nearly full since that date, and it was expected by the end of the first week in March they would be turning out their usual amount of work.

THE UNION STOVE WORKS, 70 Beekman street, New York, have completed arrangements by which they are the Eastern agents of the Milwaukee Gas Stove Company, Milwaukee, Wis. They are already making a display of cooking and heating stoves. The Perfection gas ranges on their sample floor are connected with the gas supply and shown in full operation.

W. H. WHITEHEAD, president of the Chicago & Erie Stove Company of Erie, Pa., favored Chicago with a week's visit recently. Mr. Whitehead passed so many years in Chicago and enjoys such a wide circle of acquaintances who hold him in high esteem that a visit there is a perpetual round of handshaking.

TRADE REPORT.

The Iron Market.

Expecting that it would furnish the impetus for a rising tendency, manufacturers of Iron would gladly see a moderate advance in Ore and Coke. But no one wants to be the pioneer and run the risk that competitors cover later at lower prices. While the attitude of buyers of Raw Material is friendly, it is also one of uncertainty and suspicion.

Southern producers of Pig Iron have booked orders quite heavily and yet the market remains stationary with occasional soft spots. In Cincinnati two contracts, one for 12,000 tons of Pig Iron and another for 18,000 tons, were placed by Pipe foundries to cover sales of product.

Pig Iron statistics for the month of February show that production is not up to the mark reached earlier in the year. This is chiefly due to the fact that a number of furnaces are undergoing repairs and confirms the statement made some time since that the really modern plant north of the Potomac and the Ohio capable of making Iron at present prices is fully engaged.

Pig Iron.—The movement in the New York district has been light during the past week. We quote \$12 @ \$12.50 for No. 1; \$11 @ \$12 for No. 2, and \$10.50 @ \$11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.25 @ \$11 for No. 2; \$10 @ \$10.50 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.50 @ \$10.

The demand for Pig Iron in the Philadelphia district has been a little above the average of the past few weeks, but the supply has been in proportion, so that prices are unchanged. Makers of Pig Iron do not regard the situation with much cheerfulness, as it is found impossible to get more money for their Iron, and there is besides a very general complaint in regard to the slowness with which payments are made. Sales include all grades of Iron; the heaviest lots have been No. 2 Foundry at \$11 @ \$11.25 for Philadelphia and equivalent points, and at about \$10 for No. 2 at such points as York, Columbia, Harrisburg, &c. Schuylkill Valley buyers have also taken fair sized lots. Ordinary quotations are about as follows for Philadelphia rail deliveries, and from 3¢ to 5¢ less for water, or at points such as York, Harrisburg, &c.: Standard No. 1 Foundry X.....\$12.00 to \$12.50
Standard No. 2 Foundry X.....\$11.00 to \$11.50
No. 2 Plain.....\$10.75 to \$11.00
No. 1 Soft.....\$11.50 to \$11.75
No. 2 Soft.....\$10.75 to \$11.00

The Chicago Pig Iron market is reported as in excellent shape, every week showing a good movement in both Northern and Southern Iron. Contracts for the former are rather larger than for the latter, which, of course, is to be expected. The foundrymen who are buying the most material are the makers of specialties. Jobbing foundries are quiet. More Lake Superior Charcoal was sold during the week than for a long time. Some consumers are now disposed to

make season contracts, but they are calling only for small monthly shipments. Large consumers are still holding off. Quotations are as follows for cash:

Lake Superior Charcoal.....	\$13.00 to \$13.50
Local Coke Foundry, No. 1.....	10.25 to 10.50
Local Coke Foundry, No. 2.....	9.75 to 10.00
Local Coke Foundry, No. 3.....	9.50 to 9.75
Local Scotch No. 1.....	10.25 to 10.50
Ohio Strong Softeners, No. 1.....	12.50 to 13.00
Southern Silvery, No. 1.....	11.50 to 11.75
Southern Silvery, No. 2.....	11.25 to 11.50
Southern Coke, No. 2.....	10.00 to 10.25
Southern Coke, No. 3.....	9.50 to 9.75
Southern, No. 1, Soft.....	10.00 to 10.25
Southern, No. 2, Soft.....	9.50 to 9.75
Alabama Car Wheel.....	17.50 to 18.00
Jackson County Silvery.....	15.00 to 15.25
Other Ohio Silvery.....	14.25 to 14.50

The demand for Bessemer Pig Iron has been extremely light in the Pittsburgh market during the week, and prices are showing a somewhat weaker tendency. On account of the unsettled condition of the Coke question, furnaces are not pressing the market for sales. Mill and Foundry Iron are quiet in demand and unchanged in prices. We quote as follows:

No. 1 Foundry.....	\$10.50 to \$10.65, cash.
No. 2 Foundry.....	9.65 to 9.70 "

The feature of the week in the Cincinnati Pig Iron market has been the large buying of Southern metal by Pipe works, both in the East and West, the principal orders having been secured by local agents. Several days since a contract for about 12,000 tons was placed by local manufacturers of Cast Iron Pipe, and on Monday another order for 18,000 tons was secured by representatives of Cincinnati houses. Both contracts have been entered by Southern furnaces at prices represented by inside quotations, and the deliveries extend over the next five months. The bulk of the sales has been of No. 3 Foundry and No. 2 Soft at \$6.25 and \$6.50 per ton respectively. Birmingham basis, or \$8.50 @ \$8.75 per ton; Cincinnati basis, No. 2 Foundry and No. 1 Soft at \$6.75 Birmingham, or \$9 Cincinnati. For some time past the demand for Softeners has been relatively greater than for the ordinary foundry grades, especially for No. 2 Soft, so that in a schedule of prices No. 2 Soft appears as an intermediate grade—that is, between No. 3 and No. 2 Foundry in price, but No. 2 Foundry and No. 1 Soft are regarded as upon the same level of value. The demand for No. 1 Foundry is relatively light, and it is quotable at \$7.25 Birmingham or \$9.50 Cincinnati. The contracts placed by radiator manufacturers cover about 9000 tons. In addition to the large trade noted there has been a fair inquiry from moderate sales to the general consumer. Car works have made additional purchases of 500-ton lots, and general foundries and mills have shown more disposition to buy more freely, or rather less sparingly. Taken all in all, the trade conditions are more encouraging and manufacturing lines are especially confident. Quotations are given as follows:

Southern Coke, No. 1.....	\$9.75 to \$10.00
Southern Coke, No. 2.....	9.00 to 9.25
Southern Coke, No. 3.....	8.50 to 8.75
Ohio Soft Stone Coal, No. 1.....	14.25 to 15.00
Ohio Soft Stone Coal, No. 2.....	14.00 to 14.50
Lake Superior Coke, No. 1.....	11.75 to 12.25

Lake Superior Coke, No. 2.....	10.75 to 11.50
Hanging Rock Charcoal, No. 1.....	16.00 to 16.50
Hanging Rock Charcoal, No. 2.....	15.50 to 16.00
Tennessee Charcoal, No. 1.....	13.00 to 13.50
Tennessee Charcoal, No. 2.....	12.00 to 12.50

Sales in the St. Louis market are reported as showing a slight improvement, but they still continue to run largely to quantities which will not average much over 200 and 300 ton lots. The local Pipe works are running full and are steady consumers of Pig Iron, and a noticeable increase is reported from the Stove foundries as well as a good trade from the machine shops. The demand runs largely to No. 2 Foundry and No. 1 Soft, which are quoted respectively at \$6.50 and \$6.75, f.o.b. cars Birmingham. Consumers are not disposed to anticipate their wants more than 60 days ahead and large sales are necessarily limited. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry.....	\$10.00 to \$10.25
Southern Coke, No. 2 Foundry.....	9.50 to 9.75
Southern Coke, No. 3 Foundry.....	9.00 to 9.25
Southern Car Wheel.....	16.00 to 16.50

Metal Market.

Pig Tin.—The movement in wholesale prices has been narrow, not exceeding 0.25¢ @ 0.30¢. Speculation has shown less animation and nothing distinctly new in the way of incentive to operations has materialized. At intervals there were signs of weakness and of strength, but neither developed pronounced form from which "bulls" or "bears" derived any decided advantage. Business with out of town dealers and with consumers was slack during the early part of the week, but subsequently improved and involved quite the average amount of Tin all told. Prices at the close were firm on cable advices of an advance in London. Small lots of Straits Pig from store are quoted at 15¢ @ 15½¢. Arrivals during the week were moderate, but the supply at all is considerable and the general statistical position is without important change.

Copper.—Prices during the week have fallen to a still lower level. On the decline a very fair business has been done, chiefly in the form of moderate sales to home consumers. In some quarters it is asserted that the decline was due to manipulation by alleged "shorts," but this has hardly the foundation that is back of another explanation to the effect that the market suffers from heavy supplies at producing points, conservative buying by home consumers and difficulty in working export business except at lower prices than those above quoted. In point of fact the market has the appearance of being weak on its merits. Jobbers are quoting 10½¢ @ 11¢ lb for Lake Ingot in small quantities and about 9½¢ for Common Casting brands.

Sheet Copper.—Consumers are showing more inclination toward purchasing for stock. Inquiry is fairly brisk and some increase is noted in orders for Cornice Copper. Small lots of Sheet Copper from store are quoted at the list price, 14¢ @ 15¢ lb, net.

Pig Lead.—Desires have been on a very moderate scale and no improve-

ment whatever in the demand has taken place. Buyers go hardly as far as to make reasonable bids on round lots. Prices are a trifle lower and the market is weaker in tone. Retail quantities of American Pig from store are quoted at 3½¢ @ 3¼¢ lb.

Lead Pipe and Sheet.—A better feeling is reported among buyers, although the strikes in the building trades in this city have caused a temporary lull in the demand for material for spot use. The outlook in the department of Plumbers' Supplies is regarded as favorable for a good summer and spring business. Prices in this section are maintained on the list basis, namely, 5¼¢ for Pipe and 6¼¢ for Sheet, with 20 per cent. discount.

Spelter.—Buying interest has not been as good as it was during the preceding week, and the demand at present is lifeless, being mainly confined to small lots for early delivery. Western brands in small lots are quoted at 3¼¢ @ 4¢ lb from store.

Antimony.—A moderate business only has been effected. For small quantities the ruling quotations are about 8¢ for Hallett's and 9¢ for Cookson's.

Tin Plate.—Little or nothing in the way of improvement is perceptible in the condition of the market for foreign Plates. Orders from the canning trade are still much below the average for this season in the matter both of spot and forward deliveries. Other consumers, too, show as yet only a moderate inclination toward purchasing beyond the limits of their immediate needs, and dealings in spot stock, although somewhat larger in the aggregate than last week, do not rise above the commonplace. The slackness of business has induced an added keenness in competition for orders, which, together with the augmented output of the domestic works and unfavorable advices from abroad, has served to keep prices unsettled and weak. Stocks in the New York warehouses are not excessive, and the assortment is far from full.

A special London cable dispatch of March 13 to *The Iron Age* reports as follows on the British Tin Plate market: Tin Plate prices average three halfpence lower and the market is very depressed. Many makers are unable to accept such low limits. Buyers seem to be awaiting developments. The proposed scheme to control prices receiving little support has had adverse effect upon the market. Larger demand reported for Wasters for Eastern markets. Stocks at Swansea now about 239,000 boxes, a decrease of about 48,000 boxes the past week. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, IC 14 x 20 ..	8/10½ @	9/3
Siemens Cokes, IC 14 x 20 ..	9/3 @	9/6
Ternes, 20 x 28 ..	17/6 @	22/6
Charcoals, IC 14 x 20 ..	10/ @	13/

THE NEW PLANT of the Pittsburgh Reduction Company, manufacturers of pure aluminum, at Niagara Falls, N. Y., which has been under construction for some months, is about completed and is expected to be put in operation about April 1 next. At the start out the plant will have about three times the capacity for the manufacture of pure aluminum over the present plant of this concern located at New Kensington, Pa. This concern have been negotiating for some time with the United States Government for the supplying of aluminum for three new torpedo boats and they expect to secure the order.

Chicago Report.

Scrap.—A moderate trade is in progress, which is sufficient to take about all the Old Material now offering. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap.....	\$6.50	
Machinery Cast.....	5.50	
Malleable Cast.....	5.00	
Store Plate (free of burn).....	4.00	
Burnt Iron and Grate Bars.....	3.00	
Sheet Iron and Hoops.....	2.00	
Plow Steel and Breaking Stock.....	4.00	
No. 2, such as Shovels, Hoes, &c.....	3.00	
Old Boilers—whole (iron).....	3.00	
(Iron)—cut in single Sheets and Rings.....	5.00	
Old Gas-Pipe and Boiler Tubes.....	5.00	
Cast Borings.....	3.00	
Turnings.....	4.00	
Horseshoes.....	7.50	
Copper Bottoms.....	6 ¢	
Copper Clips and Heavy.....	7 ¢	
Heavy Brass.....	6 ¢	
Light Brass.....	5 ¢	
Pipe Lead.....	2½ ¢	
Tea Lead.....	2 ¢	
Zinc.....	2½ ¢	
Rubber.....	4 ¢	

Anthracite.—Business is light. Carload lots of 12 net tons or over are quoted as follows, although some concessions are now being made:

	Egg, Sto.	Grate, and Ch.
Chicago, Ill.....	\$4.75	\$5.00
Milwaukee, Wis.....	4.75	5.00
Kansas City, Mo.....	7.95	8.20
Council Bluffs, Iowa.....	7.95	8.20
Lincoln, Neb.....	7.95	8.20
Sioux City, Iowa.....	8.00	8.25
Abbecon, S. Dak.....	6.05	6.30
Dubuque, Iowa.....	6.25	6.50
Madison, Wis.....	7.25	7.50
St. Paul, Minn.....	6.25	6.50
Burlington, Iowa.....	7.75	7.95
Des Moines, Iowa.....	6.05	6.30
Davenport, Iowa.....	7.95	8.20
St. Joseph, Mo.....	7.95	8.20
Leavenworth, Kan.....	7.95	8.20
Omaha, Neb.....	7.95	8.20

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Pueblo.....	8.00
Colorado Springs.....	8.00
Leadville.....	10.00
Cheyenne, Wyo.....	10.00
All points between Denver and Missouri River.....	8.85

AN ENTIRE FLOOR of the William Yerdon Factory, at Fort Plain, N. Y., is being equipped with the latest machinery for the manufacture of tin rails, which is a new industry for the place. A pail is manufactured, it is stated, in two minutes after passing through various machines. Mr. Yerdon has secured the services of Thomas McAnamy of Los Angeles, Cal., who for a number of years was superintendent of one of the largest factories of this kind on the Pacific Coast. The superintendent of the pattern making department is E. E. Beckwith of Newark, N. J., who was for several years with the A. C. Beckwith pattern making works in that city. A large force of men will be put on as soon as the factory is ready for operation.

CHARLES HOOPER & Co., Dubuque, Iowa, issue circulars calling attention to their muffle Furnaces, also their smelting Furnaces and annealing and burning Furnaces. The muffles are particularly intended for enameling work. At the end of the circular are a number of testimonial letters from those who have used these Furnaces with satisfactory results.

CONDITION OF THE

Hardware Trade.

IT IS PLEASANT to note the improvement in business which is perceptible in some of the trade centers, as this encourages the hope that with the further advance of the season there will be such a general increase in the volume of business as will bring the demand up to something like its normal volume. The indications seem to point to a more marked improvement in the South and West than in the Middle and Eastern States. While it is the general experience that the volume of business is better this year than last, it is not uncommon to hear references to the sluggishness of trade and the reluctance of merchants to buy at all freely. Stocks are certainly kept at an abnormally low point, prices show little change and the market does not as yet assume a regular and uniform tone. There is some complaint in regard to collections and credits are being scrutinized with more than the usual care.

Advices from Chicago.—Shelf Hardware exhibits decided improvement. Orders are still confined to small lots and packages are broken as much as ever, but the orders are very much more numerous. Stocks continue extremely light throughout the country, and as spring advances the demand grows heavier on the retail merchants and they are obliged to replenish more frequently. The weather has been wintry for the past week and has undoubtedly checked outdoor operations considerably, and it is therefore argued with much reason that if trade can be so good under these conditions, it must make a decided spurt as soon as actual spring weather sets in and all kinds of outdoor improvements can be undertaken. The demand for Poultry Netting has been extremely heavy for the past week, but other seasonable goods have not been moving in very large quantities. Prices show little change. Carriage Bolts are still irregular owing to conflicting quotations from manufacturers, and Screws are unsettled on account of the recent circular issued by a large company. The movement in Tinware and House Furnishing Goods has shown a notable increase during the past few days, and the dullness of February is now in a fair way to be forgotten. Taking a broad view of the Hardware situation, it is believed that the volume of business so far this year has been a distinct gain on that of last year up to the same time. Inquiries for Roofing Plates have been larger recently than at any time since last fall, and an early improvement is confidently expected.

Notes on Prices.

Wire Nails.—The volume of business is fair but not especially heavy, the trade confining their purchases to quantities sufficient to cover their early requirements. The tone of the market is not materially different from last week, but there are indications that one or two of the mills are making slight concessions in prices. The fact that jobbers are cutting the price has some effect even beyond the territory in which such cut prices are offered. With the opening of the spring and the going into effect of the new freight rates it is expected that there will be a quickening in the demand, and some are looking for a marked

strengthening in the market with a possible advance.

Advices from Chicago.—Manufacturers appear to be well satisfied with the existing situation, except only with reference to trade in this city. They state that prices are firm and a good volume of business is moving. Predictions are quite freely made of an advance in manufacturers' prices before April 1, on account of the anticipated increase in the demand as soon as actual spring weather is experienced. Jobbers have recently enjoyed a considerably better business from retail merchants, but they state that their trade in this line is very much below the volume enjoyed last year up to the corresponding time. Small lots from stock are quoted at \$1 to \$1.05, but carload lots are still sold by a few of the leading houses at the old low price, equivalent to 95 cents, Chicago.

Cut Nails.—Somewhat more business is doing in Cut Nails than a week ago. The market continues without change. Small lots from store, New York, are held at 85 to 90 cents.

Advices from Chicago.—Manufacturers have enjoyed a somewhat better business since our last report. Orders seldom run above carload lots, but these have been a little more plentiful. Jobbers sell small lots from stocks at \$1.

Barb Wire.—An increasing activity is evident, and the demand is setting in somewhat more freely. The prices at which Barb Wire is being offered by some of the jobbing houses have the effect apparently of unsettling the market to a slight extent. The outlook for the season's business is regarded as favorable.

Advices from Chicago.—Orders are increasing for shipment from factory. The movement recently has augmented very considerably. The expected increase in March is now being realized, and almost every day shows a greater demand. Some of the factories are now very busy, and managers will not be surprised if in a short time they fall behind their orders in accordance with their rules of experience. Small lots from stock are in improving demand at \$1.65 for Painted and \$2 for Galvanized.

Screws.—There has been no important change in the Screw market since our last issue. The volume of business appears to be moderate, the lower prices announced not having the effect to any marked degree of stimulating trade. Several of the manufacturers have refrained from issuing circulars announcing the revised prices, which are referred to as unprofitably low. The object of the manufacturers in adopting the new discounts was to make them represent the market, and they are adhering quite firmly to them and refuse to give extras as before.

Binder Twine.—The Binder Twine market is in a demoralized condition as far as prices are concerned. White prices are nominally based upon a quotation of 5 cents per pound for Sisal Binder Twine, it is reported that the held over or Banker's Sisal Twine has been offered at 4 cents per pound. While this price is not being met by manufacturers of new Twine, it is a leverage which shrewd buyers make use of when requesting quotations. It is understood, however, that some manufacturers are not desirous of selling Sisal Twine for less than 5 cents, although this price applies to both small and large quantities. Orders have been placed more freely for Twine during

the past two weeks than heretofore this season, although the volume of business is still small. The following quotations for Twine represent the market fairly well:

	Per pound.
Sisal.....	4½¢ to 5
Standard.....	5
Manilla.....	4½¢ to 5
Pure Manilla.....	6½¢ to 7

Comet Lawn Sprinkler.—The Comet Lawn Sprinkler, put on the market by the E. Stebbins Mfg. Company, Brightwood, Mass., and illustrated in our issue of the 23d ult., is sold to the trade at \$5, subject to a discount of 20 per cent.

Nymur Nozzles.—H. F. Neumeyer, Macungie, Pa., manufacturer of the Nymur Nozzles, a description of which was given in our columns a few weeks since, advises us that in view of the number of Nozzles sold and ordered, he has reduced the price from \$54 per gross to \$50 per gross.

Glass.—There are no encouraging features in the Glass market, demand continuing limited and prices unremunerative. Committees were appointed at the manufacturers' meeting held in Pittsburgh February 23 to investigate certain features of the Glass business and to report at the next meeting. The subject of foreign competition is receiving considerable attention in connection with the attempt of manufacturers of American Window Glass to work in harmony. It is understood that foreign producers secure advantages in freight to inland points by obtaining direct rates from Liverpool to Chicago and Minneapolis, thus laying their Glass down at those points at a less cost than Pittsburgh manufacturers are able to do. This matter, among others, is receiving the attention of the American manufacturers. It is impossible to determine the result of the movement among manufacturers, as the Glass interests are so large and diversified and as so many questions will have to be considered before any agreement can be reached.

Roofing Slate.—At a meeting held by the Bangor Roofing Slate Manufacturers' Association, at Easton, Pa., on February 28, a revised list of prices for Bangor Roofing Slate was adopted, to come into operation on April 1, 1895. The new list is as follows, per square:

Genuine No. 1 Bangor.

Size.	Price.	Size.	Price.
24 x 14	\$3.35	16 x 12	\$3.65
24 x 12	3.35	14 x 10	3.65
22 x 12	3.60	18 x 9	4.25
22 x 11	3.60	16 x 8	4.25
20 x 12	3.60	14 x 8	3.75
20 x 10	4.00	14 x 7	3.50
18 x 10	4.00	12 x 8	3.50
16 x 10	4.00	12 x 7	3.25
18 x 12	3.65	12 x 6	3.25

Genuine No. 1 Ribbon.

Size.	Price.	Size.	Price.
24 x 12	\$2.75	14 x 10	\$3.00
24 x 12	3.00	14 x 8	3.00
22 x 11	3.00	18 x 9	3.25
20 x 12	3.00	16 x 10	3.25
20 x 10	3.00	16 x 8	3.25
18 x 10	3.00		

Terms: Acceptance at 60 days from date of shipment, or 2% for cash. All freight charges are based on 650 lb to the square. In less than carload lots the cost per square for freight is about double the cost of the carload lots.

John Galt & Son, Postal Telegraph Building, Broadway, New York, forward us the following revised price-list for Albion Vein Roofing Slate at quarry:

Size.	Price.	Size.	Price.
24 x 14	\$3.25	16 x 10	\$3.85
24 x 12	3.25	16 x 9	3.85
22 x 12	3.45	16 x 8	3.85
22 x 11	3.45	14 x 10	3.50
20 x 12	3.45	14 x 8	3.40
20 x 10	3.85	14 x 7	3.30
18 x 12	3.50	12 x 8	3.25
18 x 10	3.85	12 x 7	3.25
16 x 12	3.50	12 x 6	3.25

Block Tin Pipe.—A reduction has been made by the manufacturers in the list price of Block Tin Pipe from 30¢ to 25¢ $\frac{1}{2}$ lb, with the customary discount of 20%.

White Lead.—Business has been more active and the market shows somewhat improved tone. Competition is not lifeless by any means, nor have jobbers ceased to make special rates when by so doing the sale of more profitable goods is expedited; but extreme lowest rates recently made by some outside manufacturers are not duplicated and more discrimination is made by jobbers in the matter of concessions. The recognized leading brands of American Lead in Oil are quoted in retail quantities at 5½¢ to 5½¢ $\frac{1}{2}$ lb. English is selling in small quantities only as some few brands may be wanted for some special purposes. German is finding very limited sale and importers' prices are without change.

Red Lead.—Foreign brands, the cheaper grades particularly, have been meeting with somewhat better sale, chiefly in fair sized lots for immediate delivery. The movement has served to steady prices somewhat, without, however, causing any advance over late quotations. Domestic product remains without change as to prices and is finding only routine sale. The jobbing price for moderate sized lots is about 5½¢ $\frac{1}{2}$ lb.

Old Metals.—Business all told has been only moderate, but an improvement in the volume of inquiry indicates a better feeling among consumers of this class of material. Scrap Iron has shown a more active movement during the week, but supplies are sufficiently abundant to prevent any advance in prices, which continue low for all classes of Old Metals. The following quotations represent about the current rates paid by dealers in this city:

Heavy Copper.....	$\frac{1}{2}$ lb 7 ¢
Light and Tinner's Cover.....	$\frac{1}{2}$ lb 6½¢
Heavy Brass.....	$\frac{1}{2}$ lb 4½¢
Light Brass.....	$\frac{1}{2}$ lb 3½¢
Lead.....	$\frac{1}{2}$ lb 2½¢
Tea Lead.....	$\frac{1}{2}$ lb 2½¢
Zinc.....	$\frac{1}{2}$ lb 2½¢
No. 1 Pewter.....	$\frac{1}{2}$ lb 5½¢
No. 2 Pewter.....	$\frac{1}{2}$ lb 5½¢
Wrought Scrap Iron, $\frac{1}{2}$ gross ton.....	\$7.50 @ \$8.00
Heavy Cast Scrap.....	$\frac{1}{2}$ gross ton..... 7.50 @ 8.00
Stove Plate Scrap.....	$\frac{1}{2}$ gross ton..... 5.50
Burnt Iron.....	$\frac{1}{2}$ gross ton..... 3.00

Old Rags, Paper, &c.—Business is spasmodic, and the call for Paper stock irregular. Dealers' purchasing prices, New York delivery, are approximately as follows:

No. 1 White Rags.....	$\frac{1}{2}$ lb 3 ¢ @ 3½¢
No. 2 White Rags.....	$\frac{1}{2}$ lb 2½¢ @ 2½¢
Mixed Rags.....	$\frac{1}{2}$ lb 1 ¢ @ 1 ¢
Blues and 3ds.....	$\frac{1}{2}$ lb 1½¢ @ 1½¢
Hard Sized White Shavings.....	$\frac{1}{2}$ lb 2½¢ @ 2½¢
No. 1 White Book Shavings.....	$\frac{1}{2}$ lb 1 ¢ @ 1 ¢
No. 2 White Book Shavings.....	$\frac{1}{2}$ lb 1 ¢ @ 1 ¢
Light Book Shavings.....	$\frac{1}{2}$ lb 1 ¢ @ 1 ¢
No. 1 Mixed Shavings.....	$\frac{1}{2}$ lb 1 ¢ @ 1 ¢
No. 2 Mixed Shavings.....	$\frac{1}{2}$ lb 1 ¢ @ 1 ¢
No. 1 Printed Books.....	$\frac{1}{2}$ lb 1 ¢ @ 1 ¢

Trade Notes.

THE 1895 CATALOGUE Issued by Wallace & Sons, 29 Chambers street, New York, is a well printed pamphlet of 80 odd pages. The brass and copper rolling and wire mills of the company are at Ansonia, Conn., and a general view of the works forms the frontispiece of the publication. A view is also shown of their New York warehouse, this being followed by an alphabetical index of the contents. The first goods are Sheet Brass, then come German Silver Wire, Brass and Copper Wire, Plating machines, Sheet and Bolt Copper, Cornice Copper, Copper Bottoms, Nails and Tacks. A variety of Soldering Coppers are shown, known as the Star brand, and particular mention is made that they are hand forged and not cast. Rivets and Burrs and Tubing follow, the tables of Tubing giving all particulars of both the brass and copper. Ferrules, Chains, Snaps, Brass and Zinc Stair Plates, Hinges and Checks come next; then a varied assortment of fancy Brass Borders, Oilers, Wire Cloth, perforated Brass and Copper, Lanterns, Lamps, Burners are noted. The final pages of the catalogue are given up to tables showing the difference in wire gauges; also tables of weights and dimensions of Copper and Brass Wire, weights of Sheet Copper, tables of areas, circumferences, diameter of circles and other tables of general interest.

THE GRECIAN METAL POLISH COMPANY is the name of a concern recently organized in Kingston, N. Y., for the manufacture of a liquid Polish which is said to be excellent for cleaning and polishing metals. Luke R. Ford is president of the company.

WM. J. GORDON, 218 New street, Philadelphia, is running his works at their fullest capacity. He reports that the orders on hand for his specialties are sufficient to keep his shop full for sometime. He has just issued a 20-page catalogue, of convenient size, covering his line of special machinery for the manufacture of Tin and Sheet Iron Ware and Can Body Machines. Especial prominence is given to the Gordon Patent Automatic Can Body Power Seaming Machine, which it is claimed will seam and deliver at one operation, at the rate of 10,000 to 20,000 can bodies in ten hours, and are adapted for seaming the bodies of fruit, paint, lard, spice, baking powder, snuff and lye cans, and a large variety of other articles. Other machines shown are a Single Action Power Press, Combination Power Press, Double Action Power Drawing Press, latest improved Drawing Power Press and an Edge Curling Machine, all patented.

A FIRE which occurred in Detroit, Mich., on March 8, destroyed a large

building occupied, along with other manufacturing firms, by the Detroit Stamping Company and Wagner & Ernewein, manufacturers of tinware. The total loss is estimated at about \$90,000.

THE ALLEN & ACKLEY ANTI-RUST JAPAN MFG COMPANY are one of the rising enterprises of Cincinnati, Ohio. The company's works are reported to be in active operation filling orders for their specialty, a preparation which is claimed to prevent the corrosion caused by the action of salt air and salt water on metals exposed to their influence. A recent government test of metal plates coated with this composition resulted in a very favorable report being made in regard to it by the navy officials who conducted the trial.

THE PLANT of the Field Force Pump Company, Lockport, N. Y., was destroyed by fire on March 8. The loss is estimated at \$25,000; insurance about \$12,000. About \$3000 worth of new machinery had been put into the building the day before. The fire is supposed to have been of incendiary origin.

THE F. F. ADAMS WRINGER WORKS of Erie, Pa., which are a branch of the American Wringer Company, will be dismantled in the course of two or three months. The machinery will be divided between the works of the company in Auburn, N. Y., and Woonsocket, R. I. The works to be dismantled give employment to 130. The annual payroll is about \$60,000. The capacity of the American Wringer Company will remain as large as hitherto by increasing the business in Auburn and Woonsocket.

THE ESTEY WIRE WORKS COMPANY have been incorporated, with a capital of \$25,000. They will continue the business formerly conducted under the style of W. B. Estey at 65 Fulton street, New York. Mr. Estey, Cornelius P. McGuire, John C. Hessler and W. O. Chapmen are interested in the new company.

THE lower foundry of R. D. Wood & Co., at Melville, N. J., has resumed operations.

F. I. EVERETT has been engaged by Hibbard, Spencer, Bartlett & Co. of Chicago to represent them in Northern and Central California during 1895. Mr. Everett formerly represented the Huntgring Hopkins Company of San Francisco.

THE HYDRO CARBON BURNER COMPANY have been incorporated at Kansas City, Mo., with a capital stock of \$100,000, for the purpose of manufacturing a vapor burning device.

JAMES E. SALTER of Philadelphia. Jawood Lukens, A. L. Murphy and Jesse L. Heywood of Conshohockee, and Lewis N. Lukens of New York, have organized the Conshohocken Galvanizing Company. The officers are: President, James E. Salter; treasurer, James E. Salter; secretary, Jesse L. Heywood. The company were organized for the purpose of galvanizing, leading and tinning metals. Their principal business will be galvanizing pipe. A part of the buildings of the Tube Company, Conshohocken, will be used for the present for the tanks and other necessary apparatus.

The city of Anderson, Ind., has let a contract for the erection of a garbage crematory at a cost of about \$6000.

A Blow at Eight-Hour Laws.

The Supreme Court of Illinois has decided unanimously that the eight-hour law for women which was enacted in 1893 by the Legislature of that State is unconstitutional. The act expressly prohibits women from working in any manufacturing establishment more than eight hours in any one day. The court holds that a woman has the right to contract to work as many hours in a day or a week as she may see proper. The mere fact of sex does not justify the law making power to restrict the right of any person to dispose of her labor as she sees fit. But the decision goes further than this and lays down the broad principle that an act which abridges the freedom of contract between workman and employer in a lawful occupation is unconstitutional. In far-reaching results this decision is regarded as exceedingly important. It is stated to be the first decision in the United States against eight-hour laws, and thus presents a new obstacle in the path of the movement for shorter hours. Labor is held to be property and the laborer is declared to have the same right to sell his labor and to contract with reference thereto as has any other property owner. The declaration that a legislature is powerless under the State constitution (which conforms on this point to that of the United States) to interfere with the freedom of contract, strikes at all enactments which have been made for the purpose of shortening the hours of labor. It therefore blasts the hopes of those labor reformers who seek to bring about a new order of things through legislation. They will have to work in another direction. Much progress has been made in the creation of a strong public sentiment in favor of shorter hours of labor, and the movement seems destined to continue to grow in strength. But the short cut through

an act of legislature has been clearly shown by this decision not to be feasible.

Displacing Planished Iron for Locomotive Jackets.

The economies forced upon railroad companies by their reduced earnings are leading to some remarkable changes. One of these is the substitution of cheaper sheet iron for the planished iron used as locomotive jackets from time immemorial. The cheap sheet iron is either japanned or painted. Not only is an important saving thus effected in the first cost of the jacket, but its subsequent care is much less expensive. Planished iron requires constant attention, being frequently oiled and rubbed, taking much of the fireman's time. The japanned or painted jacket falls to the care of the wipers or hostlers in the round houses. Numerous Western railroad companies have made the change on freight engines, and some very prominent systems are now extending it to their passenger locomotives. A heavy burden was taken from firemen's shoulders when the extensive use of brass ornamentation on locomotives was abandoned, and this later step is in the same line, but the prime consideration is not the diminution of firemen's labors, but economy in the cost of maintenance. An important outlet for the production of planished sheet iron is thus being seriously curtailed.

Nikola Tesla's Misfortune.

There is something singularly regrettable, and even pathetic, about the misfortune that has recently overtaken Nikola Tesla, the electrician, in the destruction by fire of all the mechanical instruments and scientific apparatus in his experimental laboratory, which it had taken him nearly half his lifetime to perfect. It is a loss which cannot be estimated in dollars and cents, and one, moreover, which will be felt in a measure by the entire scientific world, in which Tesla holds so high a place. The wiping out at one sweep of the work of years is a blow which must naturally strain the fortitude of a man to the breaking point. As parallel misfortunes two well-known historical incidents come to mind. The destruction by his pet dog of the sheets containing the result of precious calculations and investigations to which Sir Isaac Newton had devoted more than two years of labor, and the crushing loss which befell Thomas Carlyle in the burning by an ignorant maid servant of the manuscript of his "History of the French Revolution," lent by him to his friend,

John Stuart Mill, are cases in point. Both losses were borne with the fortitude which characterized those great men. Newton set to work to travel afresh over the old ground, and regained all he had lost, and more, in the pursuit. The later-born philosopher rewrote his famous history from memory, and declared at the end that it was vastly superior to the original. So the result may be in the case of Tesla.

The Work of Reconstruction.

Nikola Tesla has youth in his favor and is credited with the possession of a full share of the qualities of grit and persistence which are inseparable from the best kind of genius. He has, too, the advantage of beginning over again with a full knowledge of all his previous steps and processes. Provided health and life are spared, we can, therefore, look to him with confidence for much more wonderful work in the field of electrical research which he has made his own. The loss of time which will inevitably occur before the special instruments necessary to his work can be replaced, and the results of former experiments be recovered, is, however, to be regarded as a calamity, coming just at a time when Tesla was apparently so near perfecting his discovery of the means of transmitting electricity without a wire, not to mention the other important investigations on which he is engaged. He commands universal sympathy in his present misfortune, and this alone should prove a stimulus in the arduous work of reconstruction which now lies before him.

The subject of the removal of New York City's garbage is still an open question. Notwithstanding the investigations of the special commission sent out last year by Mayor Gilroy for the purpose of determining the best systems followed in other cities, the adoption of a plan which will be entirely effective under the conditions existing in New York seems to be as difficult of solution as ever. At any rate, nothing definite has yet been done in the matter. The outrageous practice of dumping the city's refuse into the sea, which was strongly condemned in the report rendered by the special commission, is still being continued.

Plans have been filed with the Board of Port Wardens, in Philadelphia, by the American Sugar Refining Company for an iron pier 548 feet in length by 75 feet in width, to be built on the Delaware River front, to take the place of three old piers now existing between South and Bainbridge streets. This will be by far the finest pier on the river.

The Brosnan Molding Machine.

In this molding machine provision is made for drawing the pattern by cam motion. A simple operation by hand or power communicates a partial revolution which raises the pattern, and after the sand is applied and compressed, a proper motion of the cam shaft in the opposite direction draws the pattern down from the stripping plate. A positive stop arrests the revolution at the right point when the pattern is up. The arrangement holds the pattern plate alternately at the respective ends of its motion first with the pattern up and then with it down without requiring any fastenings.

The frame A is provided with vertical ways or guides A', which receive long, straight parallel arms B', rigidly bolted to and extending down from a rising and sinking table or pattern plate, B, on which the pattern M is secured. A small pinion, C, is mounted on a fixed stud, A², supported on the framing A, and by means of a light fly wheel, C', and a crank handle, C², is turned at will in either direction. The cam shaft D carries the eccentric cams D' D' of equal size and similarly set on the shaft. A large gear, D², on one end of this shaft is engaged by the pinion C. In the adjustable and exchangeable stripping plate E engage T-headed screws E', which extend downward through holes in the frame. They are stiffly set by means of the nuts E², E³, E⁴.

The under face of the pattern plate B presents nicely finished surfaces adapted to receive the action of the eccentric cams D'. By giving the crank C² a few strong turns in one direction, the cam shaft is partially revolved, and the pattern plate B is raised to the required position, protruding the pattern M to the required extent through the carefully executed aperture in the stripping plate, and by means of the long straight guide arms B' held firmly against tilting. The flask, not shown, is applied and the sand introduced, rammed and struck, by hand or by machinery, in any ordinary or suitable manner. Now the operator turns the crank C² a few revolutions in the opposite direction, with the effect to lower the pattern plate and its attachments, including the pattern M. The eccentric form of the cam and the fact that the crank C² is started from a state of rest insure that the descending motion of the pattern shall be slow at the commencement. The guides or vertical ways A' steady the movement, so that there is no trembling or irregularity laterally, and the pattern is drawn smoothly out of the sand, the first part of the motion being slow and the later portion of the descending movement rapid. A projection, D³, is cast in the required position on one side of each cam.

The stops B² are fixed in the required positions on the under face of the pattern plate B. When the cam shaft has been sufficiently rotated to bring the cams into their highest position the projections D³ strike the stops B² and insure that the motion is arrested at that point.

A grooved pulley, D⁴, is keyed on the end of the shaft D, and carries a chain, G, by which a sufficiently heavy weight, H, is suspended. The force thus received tends to turn the cam shaft in the direction to lift the pattern plate and its attachments. The weight of H should be less than is required to balance the load when the eccentric cams

are at their mid height, but it is more than sufficient to lift the load when the cams are quite up. The arrangement offers little friction, and allows the attendant to turn the crank with ease alternately in opposite directions, as required, and insures that the pattern plate shall be held reliably without

when the parts are in that position. This machine is the design of M. J. Brosnan of 518 Henry street, Brooklyn, N. Y.

The American makers of oilcloth are about combining because of in-

Fig. 1.—Sectional End Elevation.

Fig. 2.—Side Elevation.

Fig. 3.—Machine with Patterns Removed.

THE BROSAN MOLDING MACHINE.

other fastening at the two ends of its motion respectively. When it is up it will be held up by reason of the fact that the eccentric cams are on their centers, and the gravity of the counter-balance weight is of full effect, and when it is down it will remain down by reason of the fact that the counter-balance weight is not sufficient to overcome the gravity of the plate and its attachments in addition to the friction

creased competition and the reduction of tariff duty. A corporation having a capital stock of over \$3,000,000 is being formed for this purpose.

The promoters of the proposed tunnel under the channel between England and France have announced their abandonment of the project owing to the opposition of the Government and the military authorities of Great Britain.

The Richards Molding Machines.

We here illustrate two forms of molding machines designed by Willard F. Richards of Buffalo, N. Y. Mr. Richards furnished the designs from which were built the four large molding machines now successfully in operation at the works of the Westinghouse Air Brake Company, Pittsburgh. Two of these machines turn out 265 complete molds per day, doing the work of 26 molders. The machine shown in Figs. 1 and 2 contains an abutment or stationary ramming block, a table for the flask to be rammed, arranged underneath the block, and a follower whereby the flask is moved toward the block for ramming. Projecting from the base A of the machine are two standards, $A^1 A^2$, connected at their upper ends by a cross piece, A^3 . The horizontal flask supporting table B turns on the standard A^1 , and consists of four upright rectangular casings, B^1 , as shown in Fig. 2. These casings are carried by a central hub, as sleeve B^2 , journaled on a fixed column, C, which surrounds the standard. The hub is supported on the base by a ball bearing, d . A horizontal follower, E, is arranged to move vertically in each chamber, B^1 , and is provided on its under side with an actuating rod, e . Each chamber is open at its upper end, and formed in its lower end with an opening for the passage of the follower rod. The follower of each chamber is guided on upright rails g , arranged in the corners of the chamber and fitting into angular guides g' . Open rectangular plates H rest upon pins h , projecting above the upper edges of the chambers, and i are the usual stripping plates. The pattern J is secured to the upper side of the follower, and the half-flask K rests upon the stripping plate i .

The stationary ramming block L is secure to the under side of the cross piece d^3 . Below the table B is the upright actuating cylinder M, the piston rod m' passing through the stuffing box of the cylinder and having its upper end located in the circular path of travel of the rods of the several followers E. The upward movement of the piston rod can thus be imparted to the follower rod standing above it. The piston is operated by steam or compressed air admitted through the pipe n . Each follower is provided with a pair of bell crank levers, o , for retarding its descent in withdrawing the pattern from the mold. These levers are mounted on horizontal pivots secured to a fixed upright plate arranged within the chamber of the follower. The upper arms of these levers bear loosely against the under side of the follower and are provided at their ends with bearing rollers for reducing the friction. The lower vertical arms of the levers are connected by links q with a cross head, Q, which moves in radial guides q^2 arranged within the chamber below the follower. The radial slides R are arranged between the guides q^2 and bear loosely with their rear ends against the inner ends of radial adjusting screws or bolts q^2 arranged in the cross head Q, so that the movement of the slide is imparted to the cross head, and *vice versa*. The inner ends of the several slides pass through openings formed in the adjacent walls of the chambers B^1 and are provided with anti-friction rollers r which bear against the face of a stationary horizontal cam, S, secured to the column C, the adjacent portion of the hub of the rotary table being recessed or cut away to clear this cam. The slides R

are each provided with a longitudinal slot, r' , for the passage of the follower rods.

The wide, concentric portion of the cam S is made of such a radius that when a slide bears against such wide portion the slide is in its outermost position, and the upper arms of the bell crank levers connected with the slide stand in a substantially horizontal position, so as to support the follower rest-

position for stripping the pattern on that side of the machine only.

The rotary table is locked in place, after bringing one of the followers under the ramming block. A spring catch operated by a treadle, T, is employed for this purpose.

In the operation of the machine, when the rotary table is turned so that one of the followers E stands under the ramming block, the slide R co-operat-

Fig. 1.—Sectional Elevation.

Fig. 2.—Sectional Plan on Line 2 2 of Fig. 1.

THE RICHARDS MOLDING MACHINES.

ing thereon in the normal position shown in Fig. 1. The narrow portion of the cam is made of such a radius that when a slide rides over the same it is allowed to move inwardly under the weight of the follower exerted on the slide through the bell crank levers and the cross head Q, thereby permitting the follower to descend sufficiently to withdraw the pattern from the mold. The narrow portion of the cam is preferably arranged toward the rear side of the machine, as shown, so that the followers are allowed to descend to the

lower end of the follower rod, moving the

follower, together with the superposed supporting frame, the stripping plate and the flask, toward the ramming block, thereby forcing the sand in the flask against the ramming block and packing

position of the parts the frame which supports the stripping plate and half flask rests upon the pins *h*. The rotary table is now unlocked and given a quarter turn in the direction of the arrow in

inward and the follower with the pattern attached thereto to descend to its lowest position, thereby withdrawing the pattern from the flask and completing the half mold. The depressed follower remains in this position until the rotary table is again shifted for presenting another unrammed flask to the ramming block, when it is again raised to its normal position by its slide riding over the wide portion of the cam *S* and swinging the bell crank levers into the position shown in Fig. 1. The flasks on the several followers are in this manner successively presented to the ramming block and rammed, and are then moved aside for withdrawing the pattern from the mold.

The machine shown in Figs. 3 and 4 is similar in its general arrangement to the one just described. In each of the chambers *B'* is placed a follower, *E*, whose rod *e* is actuated by the piston rod *l* of the cylinder *L*. The follower of each chamber is guided on upright rails *f*, Fig. 4, placed in the corners of the chamber and fitting into the angular guides *f'*. The rails are adjustable by means of the bolts *f''*. The supporting plates *G* rest upon pins *g*, and the stripping plates are secured to the upper side of the supporting plates. The arrangement of the pattern *I*, the half flask *J* and the stationary ramming block *K* will be understood from the drawings, as will also the method of supporting the platforms so they may be turned around the standard *A'*. In each of the chambers *B'* are arranged a pair of upright hydraulic cylinders, *N*, *N*, for retarding the descent of the follower after ramming the sand in the flask. These cylinders are located on opposite sides of the follower rod and in each cylinder is arranged a piston, *n*, the rod *n'* of which extends through the upper head of the cylinder, and is adapted to bear loosely with its upper end against the under side of the follower, so as to resist the downward movement of the latter, but permit it to move upward out of contact with the rods of the plungers. Formed in the hub of the rotary table *B* is an annular inlet chamber, *O*, with which the supply passage formed in the column *C* communicates. The lower end of this passage is connected with the pipe *n'*.

Each hydraulic cylinder is provided at its lower end with a combined induction and eduction pipe, *q*, and the pipes of the two cylinders of the same chamber communicate with a main pipe, *q'*, which is connected with the annular inlet chamber *O*. Each of the main pipes *q'* is provided with a three-way valve, *R*, for controlling the passage of the water to and from the hydraulic cylinders. To each of these three-way cocks is connected an outlet or waste pipe, *r*. The ways of each cock are so arranged that upon turning its plug in one direction the main pipe *q'* is placed in communication with the annular inlet chamber *O* and the waste pipe *r* is closed, while upon turning the plug in the opposite direction communication is established between the main pipe and the waste pipe and cut off between the main pipe and the inlet chamber.

The stop cocks are automatically controlled by the stationary cam *T* fixed to the standard *A'*.

The smallest radius of the cam is arranged toward the rear side of the machine, so that when the arm of a stop cock rides over such narrow portion of the cam, it is caused to move inward under the pressure of its spring and turn the plug of such stop cock in the proper direction to place the cor-

Fig. 3.—Sectional Elevation.

Fig. 4.—Sectional Plan on Line 4 4 of Fig. 3.

THE RICHARDS MOLDING MACHINES.

it around the pattern. Upon now allowing the steam to exhaust from the actuating cylinder, the follower with the superposed parts descends to the position shown in Fig. 1, when its further descent is prevented by the upper arms of the elbow levers *e*. In this

Fig. 2, so as to bring the partially lowered follower on the rear side of the machine and the next follower under the ramming block. This quarter turn of the table brings the side of the follower opposite the narrow portion of the cam *S*, allowing the latter to move

responding hydraulic cylinders in communication with the waste pipe *r* of the cock, thereby allowing the water to escape from the cylinders and permitting their plungers and the follower and superposed parts to descend by gravity. The portions of the cam, which face the front and sides of the machine are concentric with the axis of the rotary table, and their radius is sufficiently large to retain the actuating arms of the opposing stop cocks in the proper position to cut off communication between the waste pipes of such cocks and the corresponding hydraulic cylinders, and establish communication between the latter and the inlet chamber *O*. By this arrangement, only the stop cock of the chamber standing on the rear side of the machine is opened so as to allow the follower to descend, while the cocks of the remaining three chambers are kept closed, so as to prevent the descent of their followers.

When the rotary table is turned so that one of the followers *E* stands under the ramming block, the stop cock controlling the passage of the water to the hydraulic cylinders *N* of such follower allows the water to enter the cylinders, and the plungers of the latter are therefore raised and caused to support the follower in the position shown in Fig. 3. In this position the follower is nearly flush with the upper edge of its chamber, the pattern secured thereto projects through the opening in the stripping plate and the supporting frame *G* of the latter, and the half flask rests upon the stripping plate, the flask having been previously filled with sand in the usual manner. Upon admitting steam to the actuating cylinder the piston in the latter rises, and, striking the lower end of the follower rod, moves the follower, together with the superposed supporting frame, the stripping plate, the pattern and the flask, toward the ramming block, thereby forcing the sand in the flask against the ramming block and compacting it around the pattern. Upon allowing the steam to exhaust from the actuating cylinder the follower, with the superposed parts, descends to the position shown in Fig. 1, when its further descent is arrested by the rods of the elevated plunger *n*. In this position of the parts, the frame which supports the stripping plate and half flask rests upon the pins of the chamber *B*. The table is now unlocked by depressing its foot lever *u* and is given a quarter turn so as to bring the partially lowered follower on the rear side of the machine and the next follower under the ramming block. This quarter turn of the table causes the stop cock *R* of the first mentioned follower to be turned in the proper direction to allow the water to escape from the hydraulic cylinders of said follower, and the latter now descends slowly by gravity, thereby withdrawing the pattern from the half flask and completing the half mold. The depressed follower remains in this position until the rotary table is again shifted to bring another unrammed flask under the ramming block, when its stop cock is again opened by its actuating arm riding over the wide portion of the cam and the follower is raised to the position shown in Fig. 1 by the water entering its hydraulic cylinders *N* and elevating the plungers in the latter. The several followers are thus successively brought under the ramming block and raised for ramming the superposed flask.

a suit brought against them by Angus Smith and others to set aside the certifications of lands made over to the canal company by the State of Michigan as a grant in compensation for the construction of certain public works. The property affected amounts to 68 647 acres, and includes a tract of iron lands in the Gogebic range.

The 1895 Pattern Economy Furnace.

The accompanying illustration shows the 1895 Pattern Economy furnace, brought out by the J. F. Pease Furnace Company, Syracuse, N. Y. The casing is shown broken away, revealing the internal construction and illustrating the principal features of this new form of furnace. It is specially designed for use in low cellars and is constructed to

opened. The bottom radiator is of ogee form, which reduces the friction in the air circulation and secures a larger circulation up between the radiator and chamber. The smoke pipe *C* is connected to the rear portion of the radiator directly opposite the entrance. The check damper *D*, located on the smoke pipe, is regulated by a chain which runs to any room from which it may be desired to control the furnace. The lift draft door *O* on the ash pit door *L* is likewise regulated. The McClave *T* grate, hollow bar revolving grate or anti-clinker grate can be used as desired. In describing the operation of this furnace the manufacturers point out that the products of combustion ascend into and fill the steel chamber *T*, and the smoke and gases pass through the opening at the top of the feed chute *X*, which is somewhat higher

The 1895 Economy Furnace.

burn either hard or soft coal or coke. The principles of construction and operation are similar to those of the other furnaces made by the firm, the casing, however, being 9 to 12 inches lower according to size, while the castings of the heater are made somewhat lighter, though the steel portions are kept full weight. The furnace is therefore not quite as heavy as the regular style and is sold at a lower price. The casing is provided with an inside lining of tin to prevent waste of heat. The sides of the steel combustion chamber *T* are constructed of No. 12 gauge plate, the head and top being of No. 10. The fire pot is made in two sections with cup joints, the combustion chamber resting in a cup joint on top of the second section. The dome is surrounded by a single steel plate radiator the sides of which are made from No. 18 steel. This is securely connected to the inclined top of the feed chute *X* by cementing this made, it is pointed out, prevents any escape of gas or smoke into the cellar when the door is

than the opening of the feed door, and circulate through the radiator, the products of combustion finally escaping through the smoke pipe *C*. It is mentioned that great care is exercised in the construction of the furnace to make it absolutely gas tight, while the escape of dust through the ash pit door when shaking the grate is prevented by the use of the patent dust pipe *d*. When the damper *5* is turned the dust caused by shaking the grate is drawn up into the chamber by the draft. The radiator, it is said, can be very readily cleaned with a scraper which is sent for the purpose. It operates through the clean out door and the smoke pipe collar in the rear.

The Boyden Power Brake Company, Baltimore, Md., have decided to take an appeal from the decision rendered last week by Judge Morris in favor of the Westinghouse Air Brake Company, in the suit brought by them against the Boyden Company for alleged infringement of a patented air brake mechanism.

The Secretary of the Interior has decided in favor of the Portage Lake & Lake Superior Ship Canal Company in

THE LETTER BOX.

Elbow Pattern.

From C. C., Livermore, Cal.—I would like some information regarding how to put a square elbow together. I can describe the pattern in the usual manner, but when it comes to allowing for edges I cannot get it right. I only turn over the upper part of the lower piece, and that throws the elbow out of bevel.

Answer.—We think it is the usual custom with tinnermen when making elbows, as for stove pipe, to turn the large part of the elbow so the entire edge can be turned in, especially at the heel. The small part of the elbow has the edge turned out, so as to receive the outer edge. For small elbows, as those made of tin, that are to be soldered, the throat part of the small end is usually turned out, and the heel part of the large end turned in. Just how the patterns should be described would depend perhaps on the method of working. If difficulty was experienced in putting the two parts together after the edges were properly turned, or the desired angle was not obtained, it might be well to describe the patterns so the large end would have a little more than the required bevel, and the small end a little less. When describing patterns of any kind it is usual to obtain the net patterns, and then make due allowances for edges outside of the boundary lines.

Allowance for Iron Pipe.

From C. C., Livermore, Cal.—Is there any set rule for each thickness of sheet metal in making round pipe? That is, how much to allow on the end the pipe goes in, or how much to take off on the end that goes in the pipe.

Answer.—There are general rules in use among tinnermen for making ordinary round pipe. Thus for No. 24 iron it is usual to allow $\frac{1}{4}$ inch, for No. 26 iron about $\frac{3}{16}$ inch, and for tin pipe say $\frac{1}{8}$ inch, depending on the thickness of the tin. Whether the allowance is to be given to the large end or taken from the small is a vexed question among tinnermen. When a crimping machine is used the two ends of the pipe are made the same size, the machine making the reduction. When making round pipe from heavy iron it is usual to allow three and a half times the thickness of the iron at each end, not counting for the lap. Thus supposing a certain pipe was to go inside of a flange, the iron would be marked three and a half times the thickness of the iron less than the circumference. If the inside of the small end of a pipe was to be made a certain diameter, three and a half times the thickness of the iron would be

added to the circumference. That the large end of this pipe should allow another joint to enter, the large end should have added to it another three and a half times the thickness of the iron. Thus the large end of the pipe would measure in the flat seven times the thickness of the iron more than the small end.

Trouble With Furnace.

From TINSMITH, Philadelphia.—In reply to "Dealer," who reports trouble with furnace in *The Metal Worker* March 2. Having had 24 years' experience, I would suggest in the first place that the size of the pipes be reduced, as the furnace has not the capacity to fill them. 2. The pipes are too close together; they should be divided more evenly around the top of the furnace so that one cannot rob

Trouble with Furnace.

another. 3. Do away with the cold air duct and ventilate the cellar front and back. I submit the plan of a furnace job I completed a few weeks ago, during the cold snap, in one of a row of houses situated the same as the one in which my fellow mechanic is having trouble. All of my pipes are smaller and I have no cold air duct; all I do is to ventilate the cellar. I have tested the job to see what temperature I could raise, and the results were more than satisfactory. The average temperature on the first floor was 70°. By throwing one-half of the heat to the sitting room into the hall a temperature of 94° was shown in the hall outside of the sitting room door 8 feet away from the register. The house was a two-story seven-room residence and I used a first-class 32-inch furnace. I would like to hear if some of my fellow mechanics can do better than that with large heat pipes and cold air ducts.

Cement for Marble and Basins.

From H. F. H., Boone, Iowa.—In *The Metal Worker* of March 9 "E. S. N." inquires for a cement to fasten bowls to marble slabs. If he will use white lead and sand mixed as stiff as putty, he will find that it will stand all tests. He must be sure to have it stiff and well mixed, or the oil will soak through the slab if it is thin.

From CHICAGO.—I notice in *The Metal Worker* of March 9 an inquiry from "E. S. N.," Westminster, Md., who wishes a recipe for a good cement for joining marble and basins to marble slabs. The basins should be ground to fit the marble and then plaster of paris used as a cement. When properly applied it will not break or fall off.

Japanning Tin.

From J. H. R., Munhall, Pa.—For some time I have been unsuccessfully attempting to japan tin. Can *The Metal Worker*, through its columns, explain the proper method to be employed, as manner of applying, temperature for baking, &c.?

Answer.—The japanning of tin is an operation that requires considerable skill and experience, and if our correspondent has much of this work to do, it might be well to employ a regular japanner. For japanning by the means of heat, it is necessary to have a closed closet or oven, which is to be provided with a small stove or other heating device by means of which an even degree of temperature can be maintained for any desired time. The oven should be provided with a suitable door, and can be made of brick or galvanized iron, the walls being double, similar to the portable bake ovens. Provision should also be made for a steady draft of air through the oven for the purpose of removing the vapor from the drying japan. The oven should be kept free from dust or smoke, and be provided with proper shelves and hooks, so arranged as to be adapted to holding the various articles that are to be baked. Ovens of this sort are manufactured by the G. S. Blodgett Company, Burlington, Vt.

The japan is applied to the article by means of a flat varnish brush, and when applying the japan the strokes should have such a direction as to insure their being horizontal when the article is placed in the oven, thus preventing the formation of streaks. After the articles are covered with japan they are to be placed in the oven, which can be at a temperature of about 125° F., and gradually raised to 300°. As soft solder becomes weakened at 320°, soldered articles should not be heated over 300°. The articles are to be kept in the oven for five or six hours or longer, when the temperature of the oven is gradually reduced. Baking japans of various qualities and colors can be obtained from varnish manufacturers, as can also drying japans, that do not require to be baked. If it is not convenient to use an oven for baking a lacquer for tin can be made by reducing No. 1 furniture varnish with turpentine and coloring with

any of the transparent colors. A cheap brown japan varnish for tin can be made by reducing asphaltum varnish with turpentine, or rather by putting a little asphaltum varnish into turpentine, for so little of the varnish is required that it is liable to be made too thick, and thus give the tin the appearance of being painted. A thin varnish brush should be used for applying the liquid, and by experimenting on pieces of tin the required shade can be obtained. When the article to be covered with either thick or thin asphaltum is warmed, the varnish will dry quickly, and be quite hard and glossy.

Air Bound Service.

From E. M. P., Brookhaven, Miss.—I send a sketch of a range boiler and connections which I have recently put up and which does not work. I would be glad to receive some information as to the cause of the trouble; first, to stop the owner from visiting my shop three or four times a day and worrying me, and then, too, for my own satisfaction and enlightenment. The cistern is

I have turned the kitchen stove upside down, and the "man of the house" wants hot water to bathe. The trouble is this: There is plenty of hot water in the boiler, and the pipes under the house are full and hot, but it will not run out of the faucets. I forgot to say that my pipes all run down and under the floor and then up to the sinks and bathtub. There seems to be pressure everywhere except at the faucets. The cold water flows finely, but the hot seems to stop in the pipes just where they turn up through the floor to the faucets. Now I find that by opening up a union in the hot water pipe under the house there is plenty of pressure and boiling hot water. Thinking that the whole system needed air, I attached a piece of pipe temporarily to the unused opening on top of the boiler; but that did no good. I found, too, that when I gave the pipe air by unscrewing the union under the house the water ran some from the lowest faucet in the bathroom; but when the union was made tight again the flow of water stopped. The water is heated quickly and circulates well. There seems to be a lack of pressure somewhere. Please tell me where the trouble lies. I hope my description, explain-

heated it expands and the pressure is not sufficient to displace it. In drawing water from a hot water faucet the discharge often commences with an irregular stream interspersed with air puffs, when finally the water flows smoothly. This is because there is sufficient pressure to drive the air out ahead of or along with the first flow of water. On opening the union in the cellar a siphonic action was started which caused the flow of water. Water flows from the cold service because there are no air traps in it. The arrangement of the piping has no special defects, but for a 50-gallon boiler 1-inch pipes to and from the water back are better than $\frac{3}{4}$ -inch pipes. It is better for the bottom or lowest part of any boiler to be higher than the highest part of the water back, even though many boilers are set differently.

Pattern for Conveyer.

From J. S. K., St. Louis—I would like to learn through *The Metal Worker*

Air Bound Service.

a large one, 10 feet high and 11 feet in diameter at the base, and holds 6000 or 7000 gallons. It has 4 feet of water in it, and the top of the water is $5\frac{1}{2}$ feet above the boiler. The boiler is a patent self cleaning one holding 50 gallons. It has two openings in the side, two in the top and one in the bottom. I first set it upright on the floor and without the stand and connected it in the usual way, but it would not fill up. I concluded that there was not enough pressure from the cistern, as the water was only about a foot above the top of it, and then I connected it horizontally, as shown. I used the side opening near the center for the hot water return from the water back, and connected it direct with the pipe leading to the bathroom and kitchen sink. The boiler lies on a level with the water back. The hot water pipe between the stove and the boiler has three elbows in it, and the cold water pipe has only two turns in it. The openings in the boiler are all 1 inch, which I have reduced to $\frac{3}{4}$ inch. I use only one opening in the top end of boiler; the other I plugged. The cold water supply pipe is 1 inch until it enters the boiler, when it is reduced to $\frac{3}{4}$ inch. I have one main pipe under the house taking the cold water to bathroom and sinks from which I take the cold water supply for the boiler. Now, then, the trouble comes. The work is all done, and the cook is mad because

tion and drawing will enable you to see the cause of the trouble. Is it a lack of force from the cistern, or is it a want of air in the pipes? Is my construction of hot water pipe from coil to boiler right? Please let me hear from you through *The Metal Worker*.

Answer.—The trouble is due to air collecting in the hot water pipe from the boiler where it turns down to supply the fixtures. If an automatic air valve is placed on this pipe at A or a pipe open at the top like that placed on the boiler, but run up high enough so that it will never overflow, the air can escape and the water will flow. If a pipe is used for an air vent, the end may be turned down after it has run up above the highest probable water level and the end carried to a sink so that an overflow could do no harm. A dip such as is shown is common in piping house service and only gives trouble when the water pressure is extremely low, as in this case, where, the head being about 5 feet, the pressure is but slightly over 2 pounds. All water contains more or less air, and in boiling the air is liberated to collect at some point unless it can escape. In this case it has collected in the service pipe and when

how to cut the pattern for the flange of a conveyer. I have a job at hand that requires a flange around an 8-inch pipe, the flange to be wide enough to fit tight into a 16-inch cylinder and must make a circuit every 30 inches, as shown in the sketch.

Note. This is a problem that has frequently been presented to us, but has never been answered in the way requested. As a matter of fact a pattern cannot be cut for the helix described by our correspondent. To make the form the metal has to be stretched. The usual way, we believe, is to cut the metal into split disks and then hammer them until they will take the proper pitch. Then by fastening a succession of disks together the conveyer is formed.

Stained Galvanized Iron.

From SUBSCRIBER, New York—Can some reader of *The Metal Worker* give the formula for restoring galvanized sheet iron from store or mildew defects?

Note.—Galvanized iron is often discolored from dampness, and the appearance very closely resembles mildew, although, of course, it cannot properly be called mildew, which is a vegetable

growth. We think it is the custom in most shops to scour the discolored iron with a wire brush or something that would produce the same effect, and then use the iron in places where the discoloration is not objectionable owing to appearance. To restore the original appearance of the iron is impossible unless the sheets are galvanized.

A Peculiar Furnace Experience.

From CHARLES N. ARNOLD, *Norwalk, Conn.*—If "C. S.," Cleveland, Ohio, who reports a peculiar furnace experience in *The Metal Worker* of March 9, will connect the exhaust pipe from the sitting room with the furnace pit, just under the edge of the bottom plate of the furnace, instead of running it into the furnace casing or chamber, it probably will work all right, provided that the slide in the cold air box is closed sufficiently far that the heater is compelled to receive a portion of its supply of cold air from that particular source rather than from the cold air box proper. Exhaust pipes of this description are often very erratic in operation, and not infrequently disappointing in results. In my judgment, the difficulty is largely a question of too great a supply of cold air for the number and size of hot air pipes in commission, which transforms this exhaust pipe into a service or hot air pipe. Neither of the methods proposed provides the best method of disposing of the cold air in the room. If "C. S.," will send me his address I will endeavor to inform him how to construct a cold air relief or exhaust pipe that will properly ventilate the room.

From J. W. G., *Clinton, Ill.*—Referring to the communication from "C. S.," Cleveland, Ohio, in *The Metal Worker* March 9, I would suggest the following methods of meeting the difficulty. I have never met exactly this trouble in practice, but have had something similar. The cold air duct is of course made large enough to meet all the possible demands likely to be made upon it at any time. When only three

A Peculiar Furnace Experience.

or five pipes are used, as mentioned, the duct is of course larger than these pipes require. The cold air pipe should have a damper for use at such times, but we are not advised of any, nor do the sketches show one. It is likely that this was the condition when the inside cold air duct was added on the side of the furnace opposite the outside cold air duct. This latter having larger capacity than the hot air pipes in use would produce a slight pressure on windy days, which would be relieved by heated air coming from the register in question. I think a damper as men-

tioned above and properly set would prevent this trouble. I would also take the editor's suggestion and remove the length of pipe inside the furnace.

If the firm having this in charge do not care for expense I would recommend that they run pipe from the register in question direct to the nearest point of the outside duct and place an elbow and length of pipe just inside, the length of pipe pointing toward the furnace. Dampers should be placed in conspicuous places in both ducts. I think no difficulty would ever be found with this arrangement.

From S. J. P., *Pittsburgh.*—In answer to "C. S.," Cleveland, Ohio, on a peculiar furnace experience, in *The Metal Worker*, March 9, I would suggest that he reduce the exhaust pipe

A Peculiar Furnace Experience.

from 14-inch to about 8-inch, making his register box funnel shape or tapering from 14 x 20, which is the size of exhaust register, down to 8-inch or not over 9-inch, and then carry a pipe to the extreme bottom of heater, having an elbow turn up. Then put a damper in main cold air duct, if it hasn't one already; close the damper in main cold air duct until he finds the upward current drawing down the extra exhaust pipe and he will find it will work all right. The first mistake is the exhaust pipe is too large and the main cold air duct brings all the cold air the heater can take care of, consequently it won't draw on the extra one.

From EXPERIENCE, *New York.*—I had just such a peculiar furnace experience as that mentioned in *The Metal Worker* of March 9 some years ago. The room was exposed to the north and east. I ran the hot air pipe up to within 8 inches of the ceiling, and carried the cold air pipe from the floor to the furnace. Then everything worked like a charm. "C. S." can test this method easily by taking out the register and running a pipe that will fit tightly into the collar of the register box up near the ceiling. Then by having a good fire and the doors leading from the room closed, a few minutes will show him how he must vary the piping to suit the rooms to get the results he desires. There may be other circumstances connected with his case that hinder circulation, but ordinarily the method I have described will overcome the trouble. Furnace problems are very simple, consequently very elusive. If the cold air and hot air pipes are properly proportioned with the size of the furnace, air will flow in almost any direction. Msdam Nature wants her laws obeyed and she can be coaxed to do most any thing, but always makes trouble when forced. She has always been very kind to me, and will be to any one who tries to please her.

Trouble With a Water Tank

From C. A. W., *Weissburg, Pa.*—About 18 months ago I was called upon to line a water tank which was used instead of a cistern. The tank was 7 feet long, 4 feet wide and 6 feet deep, and I used in it No. 26 galvanized iron. The tank itself is made of 2-inch planks thoroughly braced so it cannot expand. I considered it well made of wood, and put in the iron and soldered the seams as thoroughly as I could. The owner, however, soon reported that the tank was leaking, and when I came to find out the trouble I discovered that about one half of the side seams were cracked. I repaired it, but again it leaks. I find the bottom is all right. I would like to hear from readers of *The Metal Worker* if they have had similar experiences and how they overcame the trouble.

Finish for Slate Roofing on Ridge and Hip.

From SLATER, 772 *Columbia street, Hudson, N. Y.*—Replying to the inquiry of "M. A.," Suffolk, Va., that appeared in *The Metal Worker* of March 16, and noticing the explanation you have given him, would say that I think he will be obliged to look for an experienced, practical slater to teach him the trick of the trade; and if I can be of any service to him, I should like to have him write me. I would like to hear from "J. R. S.," West Fairview, Pa., who wants to know the best method of hanging gutters for slate roofs on high buildings without the use of ladders. The inquiry appeared in *The Metal Worker* of November 24, 1894.

Which Is Best for Furnace Tops?

From FOREMAN, *Newark, N. J.*—In answer to "J. C.," in *The Metal Worker* March 2, in reference to the style of furnace top, my experience has been in favor of the cone top. Either style of top will not hinder the furnace from doing good work if there is an ample air chamber under it. If the radiator in the furnace reaches up into the top, leaving no space for a volume of air to collect, the hot air pipes are not likely to be well filled. I have known unsatisfactory furnaces made to do good work with no other change than an increase in the height of the air chamber. If the radiator fills the furnace body or casing full, the air that passes up between may not be enough to fill the pipes, while if there was an air chamber for the following air to cushion against, it would flow in faster and would expand to fill the air chamber, and then the pipes would be full. For instance, a 36 inch casing inclosing a radiator 30 inches in diameter would leave 3 inches of air space all around. The 36-inch casing would have an area of 1017 inches. The radiator would have an area of 706 inches, leaving an area in the 3 inch air space of 311 square inches. Now if the furnace was put up in a house with three 9 and four 8 inch pipes, with a cold air duct 12 x 24 inches, there would be trouble without an air chamber. The area of the pipes would be 389 inches, or 78 inches more than the air space, so that some of the pipes would surely feel the effect. The area of the cold air duct would be 288 inches, or almost equal to the air space before the air is expanded by being heated. It is generally conceded that the air would, in ordinary cold weather, expand one-third, when, if there was no

air chamber at the top to receive this increased bulk due to expansion, the air would be held in check and overheated. Then, when delivered to the pipes at a high temperature, it would cool and contract in the pipes, and there being no air chamber to supply the deficiency, some annoying behavior would follow. By all means have an air chamber at the top of the furnace whichever style of top is used, and the average furnaceman will find it advisable to use the cone top in low cellars, to get the air chamber and pitch for his pipes. He will be forced to use the flat top when a number of pipes run in one direction, and he will find that, used with judgment, both styles of tops will do good work if an ample air chamber is provided. With steel furnaces having solid domes not less than 19 inches should be used on a 36-inch furnace, and increased as the diameter of the furnace and the area of the pipe increase. Furnaces having a cast iron radiator of hollow circular style, supported by pipes which bring the gases to it, may work with less air chamber.

Water Hammer in Pipes.

From G. D. H., *New York*.—Answer to inquiries of "G. A. L.," Manchester, Vt., and "G. J. M.," Oshkosh, Wis., that appeared in the *Metal Worker* March 16. The sudden closing of fire hydrant will give a shock to every house water supply for many blocks around unless their water supply pipe systems are amply provided with air chambers. The intensity of the shock, or more properly the water hammer, depends upon the length and size of the main line of the water flow between the hydrant and the reservoir, the velocity of the water in the main being the measure of the intensity of the shock at the sudden closing of a hydrant, hence much greater trouble from this cause occurs in town water systems with small sized mains. Thus under the varying conditions of the spouting, volume, and the time of closing the valve of the hydrant, there are possibilities of any percussion pressure up to 400 or more pounds per square inch being brought to bear upon the main near the closing hydrant and the house pipes and hot water boilers in the neighborhood. The only safety in a water supply system is in using care and common sense in the handling of hydrants, and, in dwellings, to provide air chambers by extending the pipes a foot or more above each bibbin the house or as many as can be made convenient. As in "G. J. M.'s" trouble, if the plumbing construction does not allow of continuing the pipe for each sink or wash basin there should be an extension of both hot and cold water pipe at the bathtub and also at the kitchen sink. If the water is used above the kitchen, second or third floor, a branch pipe may be taken out of the water pipe near the floor and carried up into the sink for an air pipe on each story. Where the water is continually under pressure at the bibbe, the air finally becomes absorbed by the water, which will be known by the hammering in the pipes when bibbs are quickly closed. In order to recharge the air chambers, the water should be shut off in the cellar and the water in the pipes drawn off at the lowest bibb with the other bibbs open, when air will be drawn into the pipes and the air chambers will become charged with air. An air chamber in the cellar will only half remedy the water ram, as it will stop the impact on the street service pipe,

but will not prevent it at the bibb that is closed suddenly. There is no necessity for making the air chamber other than with the pipe used for the house plumbing. Wherever a bibb is fastened on to a lead pipe the pipe can be continued up the wall or backboard for a foot or more as convenient. Ball cocks sometime stick. They should be left easy on the plug and the float be loaded to half immersion when free in the water; they will then pull down easy, or what is perhaps better use the compression valve and ball which is now almost universally used in our cities for flush tanks.

Method of Heating Water.

From E. M., *Omaha, Neb.*—In order that the great West shall be represented in the Letter Box, I will attempt to give "J. P.," Massachusetts, assistance with his water heating problem in *The Metal Worker* of February 16. Having set his boiler, the bottom of which should be above the heating coil for good circulation, it should be connected with the coil in the fire chamber of the steam heater, with a rise in the pipe from the top of the coil to the side connection in the boiler, and a fall in the pipe from the bottom of the boiler to the bottom of the coil. The coil has sufficient heating surface for a good size boiler, unless a great deal of hot water is drawn. The coil will expose about 14 square feet of heating surface, and having no data as to the capacity of such surface for heating water in a kitchen boiler, I make a deduction from house heating rules. One square foot of surface in a coil, under such circumstances, would carry 40 square feet of radiation, and assuming that there is a pint of water to the square foot, 1 foot in the coil should heat 5 gallons of water, and as the coil has 14 feet of surface, it would probably heat 70 gallons. The house heating rules are based on heating the same water over and over, while in the case of "J. P." cold water would enter the boiler to be heated every time hot water was drawn. However, as the surface exposed by the boiler is so very much less for the water contained in a house heating system, it is probable that the coil would keep even a large boiler filled with hot water. I would risk a 100-gallon boiler in connection with it. In piping from the coil to the boiler, at the proper or most convenient place for connecting with the summer heater a Y should be placed on both the flow and return pipe for receiving the pipes from it. On the flow pipe from both the coil and the heater a gate valve should be placed to shut off whichever is not in use. As the boiler is connected with a supply pipe, no expansion tank will be needed. Owing to the warmer temperature of the supply water and the atmosphere, the work of the summer heater will not be so heavy as that of the coil, and a small heater will do the work. Even though the coil is made of 1½ inch pipe, as stated, the connecting pipes may be 1½ inch with some advantage, and the boiler connections should be full size.

Furnace Pipe Rule.

From E. T., *New York*.—If I had the problem which "H. E. G." presents in *The Metal Worker* February 2, I would calculate on a velocity of 400 feet per minute and filling the room in 15 minutes. I would then get the velocity to do the same work in one minute by multiplying the 400 by 15, which would give 6000. I would then divide the known quantity of air by 6000, which

would give the area in feet of the opening necessary to let this amount of air through. I would then reduce the area in feet to inches and divide the result by 0.7854 and extract the square root of quotient. This would give the diameter of a pipe that would let the known quantity of air enter in 15 minutes at a velocity of 400 feet per minute. I would use a register with dimensions that would give an area 50 per cent. greater than the area of the pipe, as register faces are made much more solid or close than formerly.

Is It a Good Investment?

From T. W. R., *San Francisco*.—We reply to "J. B.," New Jersey, in *The Metal Worker* of February 23. It may be a little late, but you will remember that we do not receive *The Metal Worker* until Saturday, it then being about a week old, but we thought our experience in regard to his inquiry might be of some use to him and also to others. We cannot agree with him in the economy of a circulating pipe being a good investment in connection with an ordinary cook stove for a heater. The great objection to a circulating pipe in an ordinary residence is that the constant traveling of the water through the pipe cools off the water, as the proportionate body of water carried in a ½-inch pipe to the boiler is many times greater, consequently making it difficult to raise the temperature to the ordinary requirements for domestic use. I have seen new residences where the silver tongued plumber talked the owners into putting in a circulating pipe, there not being over 200 feet of hot water pipe, where the kitchen range could not raise the water above 110°, and by shutting off the circulating pipe it could raise the water to 160°. This is actual experience. Circulating pipes do not give satisfaction where the ordinary kitchen range is used as a heater. In large buildings, where large quantities of water are used and where a special heater or steam is used, then it is a paying investment. This experience is in California, and if it is not a success in our mild climate, it surely could not be where you have below zero weather.

Are Gravel Roofs Durable?

From W. F. COZZENS, *St. Louis*.—My attention has been called to an article in *The Metal Worker* of March 2, from G. F. Wheelock, Birmingham, Ala. His position in respect to the cost of a tin roof is well taken. I think, however, I can break the club to which he alludes as being in the hands of the gravel roofer. If he ever visits St. Louis—and Southerners do sometimes come here—I shall take pleasure in showing him tin roofs 36 years old, and one that I worked on 54 years ago, and which has not had more than one coat of paint in 20 years.

Keeping Shop Tools.

From ZENOPHEN.—I wish some of the contributors to the Letter Box would describe the best method of keeping shop tools. I will start the question ball rolling by asking for a good way to keep shop soldering coppers.

Pattern Wanted.

From C. R., *Baltimore, Md.*—Please ask some of the readers of *The Metal Worker* to submit a pattern for an 8-inch flaring collar to use in a square pipe. I think one of your former writers signing himself "Practical" described such a pattern.

STEAM AND HOT WATER.

A Pipe Fitting Question.

From SAMUEL HEINS, *Rondout, N. Y.*—Having answered many questions of *The Metal Worker* on different subjects, and wishing to help my fellow workmen in ferreting out the defects on different kind of work, I read over *The Metal Worker* of February 9 and saw a pipe fitting question from "C. E." of Worcester, N. Y. With the experience I have had I think he makes a big mistake at the starting point on the boiler. I never approved of using a T when there are fittings made that would render better service. By using a twin ell or a Y with a nipple and a 45° ell he would get better results, as I will show further on. There is less friction with them and there would be a better

is the minimum flow that would be used for 500 to 800 square feet of direct radiation, which is large enough to supply a very good size job. I show in the sketch the way I would start. I never use any elbows if I can avoid them. The connection is made with a twin elbow. Another way of making the connection is with a Y and two nipples and two 45° ells.

By this method an easy flow will be started. A part of the labor on any job is making a plan of the proposed work, which should always be done. As I understand the branch on the main, it is intended that a T shall be placed on the riser in the same way as at the boiler. If I was doing the job I would put in a Y and with 45° ells make the turns as shown. This would

A Pipe Fitting Question.

circulation. There should never be any "bull nose" fittings used on hot water work. Each one of such fittings, especially elbows, is an obstruction. I would also recommend never to take any connections from the side of a fitting. They should be taken from the top with a short nipple and a 45° ell. As far as I understand it he would not get a good circulation. I would say that *The Metal Worker* is right as it explains the case. Let me say to "C. E." that the best way would be for him to experiment and find out himself which would be the best way. That is the way I would do. The way the best mechanics find out all the defects is by experiment. As the old saying is, "If at first you don't succeed, try, try again." I have had many difficulties in my past experience, and I started with steam and hot water heating when there were only about half a dozen men in the United States who did such work. I worked for Jas. P. Wood when he was the only man in Philadelphia who did steam heating, and we had to work hard, and it took a great deal of thinking to make a job work perfectly. Now every Tom, Dick and Harry that never served a day at the business comes out as a steam and hot water fitter. I remember one man in Riverton, N. J., who never saw a hot water valve or a hot water job done, and he did not know the minimum supply of different size pipes, but came out as a hot water and steam engineer. "C. E." starts off with a 3-inch pipe from boiler, which

make a first-class job and a free circulation, but my advice to "C. E." would be to study up on steam and hot water heating.

Loss of Heat and Radiation.

From FRANK J. GRODENT, *Denver, Col.*—I have taken some interest in the questions of "H. T. G." on the loss of heat and radiation, as published in the issue of *The Metal Worker* for February 9, 1895, page 45. I have looked up the back issues of *The Metal Worker* for 1892 containing the articles of Leicester Allen on this subject, and to which you refer. In the issue of October 1, 1892, page 38, in which illustrations of different constructions of walls are given, and practical example taken of Fig. 21 to show the application of the different rules given, there are a few points of doubt to me about which I desire to question. I have been over the several articles published by Mr. Allen, and they contain some most valuable ideas, and lead direct to the subject, and it is their many good points which make me the more desirous to clear the cloud of doubt. In going through the articles I found a number of errors regarding reference letters and decimals, but these I have corrected. The practical example is the one upon which I desire information, and relates to Fig. 21. First, regarding the second coefficient of transmission being 0.4411. Is this amount correct? Conduction for lath and

plastering 1 inch thick being 3.86 units of heat per square foot per hour, for $\frac{1}{2}$ inch (being less than 1 inch) would naturally lose more heat units than if 1 inch thick. Seven eighths inch equals 0.875 inch; 3.86 divided by 0.875 equals 4.411 as the units of heat lost through 1 square foot of lath and plaster in one hour. It therefore seems to me that 4.411 should represent the second coefficient of transmission, instead of 0.4411 as published. The third coefficient of transmission as published is 1.2100, and I cannot see why 1.2100 should be called the second coefficient of transmission, and used in the first part of "operation second"—viz., "1.1558 divided by 1.2100 equals 0.9591." First coefficient as published is 1.1558, and the second coefficient as published is 0.4411. If this 0.4411 is correct instead of 4.411, as I have questioned, why do we not divide 1.1558 by 0.4411, instead of by 1.2100, which is published as the third coefficient of transmission, and to which reference as the third coefficient of transmission is made in the fourth column, page 38, issue of October 1, 1892? These articles of Mr. Allen's are very useful, but with a hitch like this in his plain way of explanation leaves a doubt in the final result not satisfactory. Possibly there are others who are in doubt on the same matter. If it can be made more clear I for one will be glad to receive an explanation that I may further investigate this most interesting subject.

Answer.—The above letter was submitted to Mr. Allen, and he furnishes the following reply:

I offer your correspondent my hearty thanks for his criticism of the figures given in the example of the application of Rule I in my article on the above subject in *The Metal Worker*, October 1, 1892. The whole of that arithmetical computation was performed by a trusted assistant, as explained near the top of the fourth column on the same page. I was too busy at the time the article was printed to give it the attention it demanded. I did not see the proofs before printing, and having looked at the series only in the most cursory way since it was published, I had not discovered the errors pointed out. The rules and formulae, which had been for some years prepared before they were published, are not vitiated by these figures. A writer in the *Popular Science Monthly* has recently said: "We often find that the errors in a conscientiously thought out thesis lead to a more thorough understanding of the subject than would have been attained had all the propositions been demonstrably true." I hope this case will prove no exception to that wise saying, although here it is only a mistake in the application, not the theorem that is questioned. If the

reasoning given at the conclusion of the article, and on which the rules are based, be not challenged (and so far no one has done this to my knowledge), the rules must stand good, and the application can be easily made to any particular case. The errors he points out in the working out of the example are admitted. It simply remains to correct them in order to reach an exact result.

The second coefficient in the computation is vitiated by the displacement of the decimal point and should be 4.411. With this correction we have, first, coefficient = 11.1558; second, 4.411; third, 1.2100; fourth, 1.1558; fifth, 1.1558; sixth, 2.50; and, seventh, 1.1558. In the second operation occurs the erroneous use of the third coefficient instead of the second in obtaining the first quotient. This quotient ought, therefore, to be $\frac{1.1558}{4.411} = 0.2600$, instead of 0.3931, as stated, and the second quotient should be $\frac{1.1558}{1.2100} = 0.9552$, instead of 1.0000. I also notice that in the fraction from which the fifth quotient in the second operation is derived the decimal point is dropped out of the denominator, although the quotient itself, as given after the sign of equality, is printed correctly. The sum of the corrected quotients and the first coefficient (according to the rule) will be 5.8360, which is the correct divisor or denominator of the fraction in the last operation whereby the temperature difference between the surface of the plaster and that of the interior air and objects is expressed. The numerator of that fraction is printed 700, instead of 70°, as it should have been, but the following quotient plainly shows that it was intended to be 70°.

Now writing this fraction again, with both numerator and denominator corrected, we have $\frac{70^\circ}{5.8360} = 11.994^\circ$, the interior temperature difference sought, instead of 11.643° as published. The difference is 0.351°. Fortunately, in this case one error corrected another so largely that the final result differs by only a trifle more than $\frac{1}{2}^\circ$ from the true difference. If the difference originally stated has been taken on trust by any one without going over the figures, it cannot, therefore, have misled any one materially. It is because it so closely approached the figure for this difference as recorded in my note book for a wall of the kind for which the calculation was made that I accepted the calculation as correct, and incorporated it into the manuscript of the article published on the date named.

In conclusion, I beg to again thank your correspondent not only for his discovery and criticism of these errors, but also for the courteous style of his criticism and the compliment he is pleased to bestow upon my humble effort to reach exact methods in a field where guesswork is much too common.

Heating Power of Petroleum and Gas Stoves.

Some very interesting information is contained in the following paper by Thos. Fletcher, the well-known gas engineer, which we reprint from an English exchange:

The data from which the following comparisons are made are too long and technical for the general reader, but those who wish to study the subject thoroughly and verify the results, will find the matter dealt with by Deville (*Comptes Rendus*) and Box ("Treatise on Heat"). The heating power of ordinary coal gas has been repeatedly verified, and the standard universally accepted is what is known as the British thermal unit—i.e., the amount of heat necessary to raise the temperature of 1 pound of water 1° F. One cubic foot of ordinary London gas has heating power equal to 660 of these units—i.e., if all the heat evolved in burning is perfectly utilized, 1 cubic foot of gas will heat 660 pounds of water, equal to 66 (Imperial) gallons, 1° F., or 6½ gallons 10° F. The heating power of an average sample of ordinary petroleum is 161,920 units per gallon, and if all the heat is perfectly utilized without waste, 1 gallon of petroleum will have the same heating power as 245 cubic feet of gas. If we take the price of gas at 2 shillings and 6 pence (82 cents) per 1000 cubic feet, the value of petroleum as a fuel should be 7½ pence (15 cents) per gallon, as compared with gas under the same conditions.

When these fuels are used in flueless stoves of any kind and the combustion is perfect the whole of the theoretical heating power given above can be and is obtained in ordinary use in heating the air. Either 245 cubic feet of gas or 1 gallon of petroleum will in a flueless stove raise the temperature of 603,000 cubic feet of air 20° F. The figures appear large, but the amount of heat required to raise the temperature of air is so exceedingly small that the figures become almost beyond the power of imagination. It will make matters more clear to deal with smaller quantities. One ounce of petroleum and 2 cubic feet of gas have precisely the same heating power, and either if perfectly burnt in a flueless stove will heat a quantity of air equal to that contained in a room 23 feet square and 10 feet high 20° F. Of course, nothing approaching this is obtained in practice for two very sufficient reasons: The walls, windows and ceiling absorb the heat rapidly, and the air in an ordinary room is on an average changed every 20 minutes by natural ventilation. Even when the walls, &c., are heated to the same temperature as the air it has been found by repeated trials that in a room this size the loss by conduction of the heat through walls, &c., is equal to that given off by the combustion of 15 cubic feet of gas per hour, and this added to the loss by ventilation makes a total of 21 cubic feet of gas, or 10½ ounces of petroleum per hour, to retain a rise of 20° F. where the room is continuously heated day and night. Of course, when the heat is only intermittent more will be required until the temperature of the walls corresponds with that of the air, and the raising of the temperature of these is a very slow process.

When we come to the heating of water or solid objects conditions are greatly changed, owing to the great loss of heat which is necessary in ordinary practice. Even with gas, in a perfect atmospheric burner with flame contact under the best conditions, water

cannot be boiled in a copper pan without a loss of at least one third of the heat; and with a petroleum lamp nearly two-thirds are lost owing to the impossibility of flame contact, which would cause smoking. The practical result is that for boiling water, the comparative value of petroleum, as compared with gas at 2 shillings and 6 pence (82 cents) per 1000 cubic feet, will not exceed about 4 pence (8 cents) per gallon.

Circuit Systems of Hot Water.

From PIPER, Illinois.—Is it practicable to pipe hot water heaters on the one-pipe system—that is, to use but one main from the boiler and to connect both flow and returns from the radiators with it, instead of running a separate flow and return main? In the one-pipe system, will the radiators that are furthest from the boiler get as warm as those that are nearer and get the water first? Will not the water be colder after passing the first radiator on the run, and so continue to grow colder after passing each successive radiator? Will the one-pipe system give as good results as the two-pipe system?

Note.—Some heating men have found no difficulty in making a hot water circuit system satisfactory. In making connection with the radiators, the flow connection is taken from the top of the circuit main, and the return from the radiator is connected with the side of the main. By this means the colder water from the radiator does not lower the temperature of the water in the top of the main to any considerable extent. In proportioning circuit mains some use the area of 1½-inch pipe for each 100 feet of radiation, which is a more generous proportion than is usually applied. By this means the main has a considerably larger area than the connections to the radiators, permitting the water which is returned cool from the radiators to flow along the bottom of the main without influencing the hotter water in the upper part. Nevertheless, it has been found that the first radiators on a circuit system become somewhat hotter than those at the latter end. In consequence, some place a greater amount of radiation in the rooms that are fed on the last end of the circuit. Where a circuit system that is properly proportioned has been installed, satisfactory results are obtained. It is claimed by those who have had the most experience with it that it is not adapted for all classes of buildings. Some information on this subject will be found on page 40 of *The Metal Worker* of March 2. We will be glad to have our readers discuss this subject more fully.

G. B. LEONARD has discontinued his business at La Salle and moved to Chicago, where as one of the partners in the firm of Leonard & Weinberg, 4316 Cottage Grove avenue, he has engaged in the heating and plumbing business. He reports the prospects for good trade as excellent, and mentions that they have on hand at present from \$3000 to \$4000 worth of heating contracts and expect soon to have their shipping and show rooms in good order.

Formula for Hot Water Piping.

BY J. L. BIXBY, JR.

The following original and purely empirical formula for calculating the size of pipes for hot water heating may be of interest to the readers of *The Metal Worker*:

Sq. ft. = square feet of surface.

D = diameter of pipe in inches.

$\sqrt[5]{F}$ = fifth root of the floor, as first, second, &c.

INDIRECT RADIATORS.

$$\text{Sq. ft.} = \frac{100 \times D^2}{3} \quad D = \sqrt{\frac{3 \times \text{sq. ft.}}{100}}$$

FIRST-FLOOR RADIATORS.

$$\text{Sq. ft.} = \frac{100 \times D^2}{2} \quad D = \sqrt{\frac{2 \times \text{sq. ft.}}{100}}$$

RADIATORS FROM RISERS.

$$\text{Sq. ft.} = \frac{100 \times \sqrt[5]{F} \times D^2}{2} \quad D = \sqrt{\frac{2 \times \text{sq. ft.}}{100 \times \sqrt[5]{F}}}$$

The appended table gives the square of the nominal diameter of the pipes in inches and the fifth root of the floors. The allowable variation from the an-

work, the incorporators being William H. Page, William A. Pope, Dennis J. O'Grady, R. T. Huggard and Thomas O'Hare.

Smith's Little Giant Water Heater.

An illustration is herewith given of an attachment intended for use with any warm air furnace. It is placed in the upper section of the fire chamber opposite the feed door, holes being drilled in the furnace casting for the passage of the flow and return pipes. Being placed in this position, above the fire, its curved shape and broad surface cause it to receive the full benefit of the coal consumed without detracting from the general heating power of the furnace. The flow and return pipes are threaded for connection with pipes running through the house. They are also fitted with washers so shaped as to set snugly against the furnace casing and prevent the escape of gas and smoke. Set screws hold the washers tightly in place.

This water heater is designed for two kinds of service. In the first place, it can be used for combination heating, to warm one or two rooms more than

letters spell "The Winchester Boiler The Best," relate to this well-known apparatus and tells in rhythmic fashion what a great boiler it is.

PRESIDENT JOSEPH BOND of the American Radiator Company had the honor of taking luncheon with the Lord Mayor of London, at the Mansion House in that city on February 28, and also had the pleasure of meeting the Lady Mayoress and family, several members of Parliament, generals and other dignitaries.

J. EDGAR TITZELL, Millersburg, Pa., has added steam and hot water heating to his business and will be glad to receive catalogues and other printed matter from the trade.

W. B. GRAVES, foreman of the steam and hot water department of the E. W. Oliver Company, Niagara Falls, N. Y., has tendered his resignation. Mr. Graves has purchased a one-half interest in the establishment of his brother, C. H. Graves of 62 North Clark street, Chicago, who is in the steam heating business.

IN AN ADDRESS before the Stationary Engineers' Association No. 2 of Cincinnati on Wednesday evening, March 13, delivered by Capt. W. H. Meredith, an old marine engineer, the speaker said that in a long experience he had found that the practice of heating and ventilating required more actual ability to carry it through successfully than any branch of engineering he knew of. The speaker went on to show the parallelism between the steam heating plant and the human body. "Let the boiler," he said, "represent the stomach receiving the fuel. Here combustion takes place and starts the vapor on its course through all the ramifications, finally entering the radiator, and there giving up its heat and being condensed into water, it again returns to the boiler through the return pipe, there to receive more heat and start on its circuit again. The steam pipes represent the arterial system and the return pipes the venous system of the human body, and the blood flows through the lungs, taking up fresh oxygen and passes on, giving strength, tone and tissue to the body. So also the vaporized water of the heating apparatus gives warmth, comfort and life to those who use it."

THE AMERICAN RADIATOR COMPANY will establish their London office at 143 Queen Victoria street and expect to occupy it by April 1. A commodious storeroom in connection will give ample space for the display of samples of all kinds of heating apparatus and specialties of American manufacture. The location is a most convenient and desirable one, and the company desire that those of the trade who visit across the water should be sure to make that office their headquarters.

The State Department at Washington is about completing a work which will be of great utility to manufacturers and others who are connected with the Central and South American trade. It is a compilation which has been in course of preparation for some time, under a provision adopted by the International American Conference some time since. The work in question is an "International Catalogue of Exports and Imports," containing a uniform nomenclature of articles of merchandise such as are common in the trade between the United States and the Latin-American countries. The terms will be published in English, Spanish and Portuguese,

Smith's Little Giant Water Heater.

swers given by the formula is the mean between the next larger and smaller size pipe. The allowable distance of the radiators from the boiler equals about one-half of the square feet of surface in the radiators. The heating surface in the main pipes must be included in the radiation.

A NEW CORPORATION at Columbus, Ohio, are the Columbus Steam Boiler & Heater Company. The company have a capital stock of \$5000 and are formed for the purpose of repairing and manufacturing steam boilers and heaters, tanks, stacks, water towers and the manufacturing of sheet and rolled iron

can be heated by the furnace, or which are too remote to be easily reached by warm air flues. In the second place, it is adapted to houses in which cooking is done exclusively with gas or gasoline, as while the furnace is in operation the house is supplied with an abundance of hot water without additional cost. Four sizes are made, which are rated to carry respectively 30, 50, 75 and 100 feet of radiation. The Little Giant is manufactured and sold by Charles Smith, 175 and 177 Lake street, Chicago.

HEATING NOTES.

STEWART A. JELLET, Philadelphia, president of the American Society of Heating and Ventilating Engineers, had a visit from Vice-President W. M. Mackay of New York this week.

THE KALAMAZOO RADIATOR COMPANY of Kalamazoo, Mich., have opened a salesroom for their radiators at 96 Lake street, Chicago, which will be in charge of Clarence M. Converse.

WE ARE REQUESTED by the Gurney Hester Mfg. Company, Boston, Mass., to state that they have no agency in New York City and that their goods are for sale to any of the trade who might apply for prices.

THE SMITH & WINCHESTER COMPANY, Boston, Mass., send out on the back of an advertising card an acrostic furnished by J. M. Knox of Chicopee, Mass. The verses, in which the initial

and the publication will probably be sold to business houses at the cost of printing.

HEATING & PLUMBING.

NEW WORK AND CONTRACTS.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until April 4, for work, including the plumbing, for the United States Court House and Post Office, New Albany, Ind. Drawings and specifications may be obtained from the custodian at New Albany.

THE BOARD OF EDUCATION of Erie, Pa., are to readvertise for bids for heating and ventilating schools 4 and 14.

W. F. RUTTER & Co., Lawrence, Mass., bid \$1841 and secured the plumbing contract which requires McShane water closets for the John Tarbox School.

THE H. R. BARKER COMPANY, Lowell, Mass., have the contract for the piping and plumbing in the Shattuck Street Universalist Church.

THE CONTRACT for repairing the steam pipes in the Federal Building, Rochester, N. Y., the estimated cost of which is \$900, has been let to Roeber & Co.

A SEPARATE building for housing a system of water closets is to be erected in connection with one of the school buildings at Utica, N. Y.

GEO. B. MARTIN, New Haven, Conn., is building a fine residence in which specially fine plumbing will be required from the successful bidder for the contract.

THE FOSKETT & BISHOP COMPANY, New Haven, Conn., have the contract for the heating and plumbing in a new residence for H. C. Warren.

W. A. T. SMITH, agent for the Kelsey Heat Generator in New Haven, Conn., has recently placed heaters for A. E. Blakeslee, A. J. Carmichael, E. F. Wilson and E. A. Hopkins. Mr. Smith calls attention to the fact that by the peculiar construction of the Kelsey it is adapted for heating rooms in large houses, however remote from the heater. The hot air chambers are built in sections and by this means the hot air from any number of these sections may be directed to any particular room. It is claimed for the Kelsey that it has a large radiating surface and gives a great heat for the amount of coal burned.

SEALED PROPOSALS, addressed to Geo. W. Kerker, Davenport, Iowa., chairman of City Hall Committee, will be received at the office of the Board of Public Works until 2 p.m. Wednesday, March 27, 1895, for all labor and material required for the steam heating, plumbing, gas fitting, electric wiring, and for a complete electric passenger elevator, with all necessary machinery and fixtures, for the new City Hall, in accordance with the plans and specifications now on file in the office of J. W. Ross, architect of said building.

SHEAHAN & GROARK, New Haven, Conn., are doing the plumbing and furnace heating of C. M. Fisher's new house; they are putting two hot air furnaces in Dr. Cremin's house, two in L. P. Sperry's house, and they are doing the plumbing and steam heating in James F. Molloy & Co.'s new factory.

They are also thoroughly overhauling the steam heating of the Winchester Avenue Railroad car houses in West Haven and have put in between 2 and 3 miles of piping in the Fair Haven and Westville car houses.

GEORGE F. HAUSLEIN, 80 Fullerton avenue, Chicago, has the contract for plumbing and drainage in the residence of Louis Reemer, 1434 Marshfield avenue.

NELSON & CEDERHOLM, 87 West Ohio street, Chicago, have the contract for the plumbing and drainage in the flat building of J. Gustafson, 183 Richmond street.

WILLIAM READ, 345 Forty-third street, Chicago, is to do the plumbing and drainage in the 15 residences and cottages being built by W. Frenk on Blue Island avenue, Leavett street, Hoyne avenue and Oakley avenue.

FRANK FALK, 729 Milwaukee avenue, Chicago, is to do the plumbing and drainage in the residence of J. P. Rusthoe, Mead street and Milwaukee avenue.

JOHN K. MORAN, 4139 Wentworth avenue, Chicago, has the contract for the plumbing and drainage in the flat building of G. Krahn, 1015 Fifty-first court.

JAMES J. DOYLE, 6040 South Halsted street, Chicago, has the contract for the plumbing and drainage in the flat building of B. F. Jones, Sixtieth and Aberdeen streets.

THE GEORGE ALIES ESTATE, 463 Division street, Chicago, has the contract for the plumbing and drainage in the store and flat building of Adolph Kruse, 2241 North Ashland avenue.

ERNST GARNER, 1740 Milwaukee avenue, Chicago, has the contract for the plumbing and drainage in the residence of E. Melins, 790 Wallace street.

JACOB E. HEDMAN, 656 West Division street, Chicago, is to do the plumbing and drainage in the flat building of William Ballman, 838 West Ohio street.

HARVEY & MOSE, 665 West North avenue, Chicago, are to do the plumbing and drainage in the flat building of B. Larson, 213 Evergreen avenue.

BYRNE & RYAN, 254 Forty-third street, Chicago, are to do the plumbing and drainage in the flat building of T. J. Davis, Sixty-fourth street and Evans avenue.

DORE & SON, 1042 West Van Buren street, Chicago, have the contract for the plumbing and drainage in the flat building of W. Farson, Birch and Kendall streets.

CHARLES C. BREYER, 187 West Division street, Chicago, has the contracts for the plumbing and sewerage in the flat building of J. H. Dittmer, 483 Potomac avenue, and in the store and flat building of J. Palenske, 803 North Hoyne avenue.

JOHN C. HICKEY, 551 South Ashland avenue, Chicago, has the contract for the plumbing and drainage in the flat building of C. Kastler, 117 Edgemont avenue.

ROBERT C. MILLER, 897 West North avenue, Chicago, is to do the plumbing and drainage in the store and flat building of A. W. Wolff, 1485 same street.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until April 19 for a low pressure return circulation steam heating and ventilating apparatus

for the United States Post Office Building at Lima, Ohio. Drawings and specifications may be obtained from the office of the Supervising Architect, Washington, or from the superintendent at Lima.

KEEFE & WARNOCK, 1105 Lincoln avenue, Chicago, is to do the plumbing and drainage in the nine cottages of L. P. Hammond, Gidding, and Lawrence avenues.

MORRIS BROS., 3442 South Halsted street, Chicago, are to do the plumbing and drainage in the store and flat building of W. Marks, 2953 Archer avenue.

ARNOLD W. ZIMMERMANN, 10,571 Meridian avenue, Chicago, has the contract for the plumbing and drainage in the residence of George Morrison, 104th and Charles streets.

The Globe Soldering Furnace.

The accompanying illustration shows the Globe soldering furnace manufactured by Couch Brothers, Dayton, Ohio. This new Globe furnace which the concern have brought out has a stationary generator so arranged that the flame will light the burner from the generator. Special attention is called to their new goose head generator, which is de-

The Globe Soldering Furnace.

scribed as an entirely new feature. The construction of the goose head is simple and very efficient in the production of gas. It is noted that the shape and construction of the burner is such that it will not clog up by the dripping of solder. It is said to be very quick in heating and melting metal and another advantage is its lightness, it weighing about 11 pounds and being but 10 inches in height.

A bill has been prepared for presentation to the New York Legislature authorizing the erection of a bridge over the East River from Grand street, New York, to Broadway, Williamsburg. The project meets with general approval, and it is proposed that the two cities unite in erecting the new structure in the same manner as was the case with the existing Brooklyn Bridge. The necessity of additional means of transportation other than by ferryboat is daily becoming more pressing, as the inhabitants of the Eastern District of Brooklyn have found to their cost on several occasions during the past winter when ice or fog have prevented the regular running of the ferry steamers.

THE TIN SHOP.

Pattern for Offset, Oblong to Round.

From E. S., *New York*.—In Fig. 1, let A B C D E F G H represent the elevation of an offset, oblong to round. A B G H represents the round pipe, C D E F the oblong, and B C F G the transition from oblong to round. In the plan, J K L M represents the round pipe, N O P Q R S the oblong, and J N S, L P Q the two triangles necessary to effect the transition. Two sections of cones are also shown by J K N O P L and J M S R Q L. As a cut through a cylinder oblique to its axis is an ellipse, the cut through the cylinder A B G H produced by the line B G will be an ellipse. A similar result will be produced by cutting the oblong C D E F

the half plan of oblong, as shown by D N O P E. Divide the semicircle N O P into any convenient number of equal parts, as shown by the small figures. With the blade of the T-square placed at right angles to D E, drop lines cutting C F. With the T-square placed at

cut on the line C F. In Fig. 3, A M H represents the half profile of round pipe, above which is drawn the elevation of same, as shown by A B G H. To obtain the shape of cut on line B G, divide the half profile A M H into the same number of parts as was N Q P,

Fig. 1.—Plan and Elevation.

Fig. 2.—Method of Obtaining Shape on Line C F of Elevation.

Fig. 3.—Method of Obtaining Shape on Line B G of Elevation.

PATTERN FOR OFFSET.

by the oblique line C F. In order to obtain the pattern of B C F G of elevation, it will be necessary to obtain the shapes on lines B G and C F.

In Fig. 2, C D E F represents a duplicate of oblong shown in elevation by similar letters. To obtain the shape of cut on line C F, proceed as follows: Above and in line with C D E F draw

right angles to C F, and brought against the points in C F, draw lines, extending them indefinitely, as shown. Measuring in each instance from C F, set off on the lines just drawn the same length as similar lines in D N O P E, and through the points thus obtained trace a line, as shown by n o p. Then C F p o n is the half shape of

and with the T-square placed parallel with A B, and brought successively against the points in A M H, carry lines cutting B G. With the T-square placed at right angles to B G, and brought against the points therein contained, erect perpendiculars, as shown. Measuring in each instance from B G, set off on the lines just drawn the same length

as similar lines in A M H, and through the points thus obtained trace a line, as shown by B m G. Then B m G is the half shape of cut on line B G. An inspection of the elevation will show that B C F G is the shape of that part of article on line J T of plan. In order to avoid a confusion of lines, a duplicate of B C F G is presented in Fig. 4. On C F is drawn the shape C n o p F in Fig. 2, and on B G the shape B m G in Fig. 3. Connect the points in B G with those in C F, as shown by the solid lines, and also by the dotted lines. The

up at right angles, to construct divisions that will give the distance from points in B m G to points in C n o p F,

Fig. 4.—Divisions Drawn on B C F G of Elevation.

lines in B C F G of Fig. 4 are shown in Fig. 5. To construct these divisions proceed as follows: Draw the right angle U V W. From V, on V W, set off the length of lines in B m G, Fig. 4. From V, on V W, set off the length of lines in B C F G, and from the points thus obtained erect perpendiculars in length equal to lines of similar number in C n o p F, Fig. 4. Thus make line W 1' of Fig. 5 equal to line C n of Fig. 4, and draw V 1', which gives the distance from point B to point n in Fig. 4 as if measured on the finished article. Connect the perpendiculars drawn from V W with the points in V U, as shown, and corresponding with the figures in Fig. 4. Thus connect 1' and 8, 2' and 9, 3' and 10, &c. The divisions shown in Fig. 6, which correspond with the dotted lines in Fig. 4, are constructed in a similar manner. Draw the right angle X Y Z, and from Y set off the length of lines in C n o p F. From Y, on Y X, set off the length of dotted lines in B C F G, and from the points thus obtained erect perpendiculars, in length equal to lines of similar number in C n o p F, as indicated by the small figures. Connect the perpendiculars drawn from X Y with the points in Y Z, as shown, and corresponding with the figures in B C F G. Thus connect 1 and 9', 2 and 10', 3 and 11', &c.

In the pattern, Fig. 7, x s r g t represents the stretchout of C n o p F, as j m l does of B m G. To obtain the pattern shown in Fig. 7, using for the

Fig. 5.—Divisions Represented by Solid Lines in Fig. 4.

Fig. 6.—Divisions Represented by Dotted Lines in Fig. 4.

Fig. 7.—The Pattern Shape.

PATTERN FOR OFFSET.

method we shall pursue for obtaining the pattern will be as follows: Supposing B m G and C n o p F to be bent

as indicated by the solid and dotted lines in B C F G, Fig. 4.

The divisions represented by solid

purpose diagrams 4, 5 and 6, proceed as follows: At any convenient place draw the line j x of pattern in length equal

to V of Fig. 5. With x as center, with radius $W 1'$ of Fig. 5, describe a small arc. With j as center, with radius $V 1'$, describe a small arc intersecting the one just drawn, thus establishing the point s in pattern. Draw $x s$ and $s j$. From the point j as center, with $B 9$ of Fig. 4 as radius, describe a small arc, as shown; then, with s as center and $1 9'$ of Fig. 6 as radius, describe another arc intersecting the other, thus establishing point 9 of pattern. With point s of pattern as center, and $n 2$ of Fig. 4 as radius, describe a small arc, which intersect with one struck from point 9 as center, and $9 2'$ of Fig. 5 as radius, thus establishing point 2 of pattern. Proceed in this manner, using the tops of sections in Fig. 5 for the distances represented in pattern by the solid lines, the tops of sections in Fig. 6 for the distances represented by the dotted lines, the stretchout of $n o p$ for the distance between points in $s r g$, and the stretchout of $B m G$ for the distance between points in $j m l$. Trace lines through the points thus obtained, as shown. From g of

parallel to the stretchout line, and, bringing it successively against the points in $C E$, cut corresponding measuring lines. Trace a line through the points thus obtained, as indicated by $F'' C'$, which forms the desired pattern. In Fig. 3, $A B G H$ represents the round part of offset, as indicated by similar letters in elevation. $A M H$ is the half profile. The half pattern, as shown by $G'' B'' A'' H''$, can be obtained from Figs. 1 or 2, but as in the previous instance, for the purpose of avoiding a confusion of lines a separate diagram is used. To obtain the pattern divide the half profile $A M H$ into any convenient number of parts. Place the T-square

that the town of Staunton, Ill., began tapping the mains a week ago and are using the Star coupler exclusively in making the necessary connections. The same thing prevails in Venice, Ill.

The Hardening of Aluminum.

A tale which savors strongly of the romantic has come from Canada to the Boston Herald, and, after publication in that journal, has been reprinted in nearly all the daily and weekly newspapers. It is to the effect that F. Allard, the Canadian blacksmith "whose rediscovery of the lost Egyptian art of hardening copper stirred the mechanical world some three or four years ago," has recently succeeded in hardening aluminum, so as to give it the consistency and resistance of iron. According to the story, Mr. Allard has made a small cannon out of his hardened metal from which he is alleged to have obtained some astonishing results. The personality of the discoverer, as detailed in a special dispatch from Quebec to a leading New York paper, is calculated to heighten the impression of romance which surrounds this tale, being very suggestive of the ancient alchemists with their mysterious ways and occult arts. He is described as being an aged man who works in seclusion and who is very likely to die without revealing the secrets of the hardening of aluminum and copper which he holds, unless he is adequately rewarded for the discovery, the inference being that no time must be lost by capitalists in pay-

Fig. 8.—Half Pattern of Oblong Part.

Fig. 9.—Half Pattern of Round Part.

PATTERN FOR OFFSET.

pattern as center, with radius $7 7'$ of Fig. 5, describe a small arc, which intersect with one struck from l of pattern as center and radius $V 7$ of Fig. 5, thus establishing point t of pattern. Draw lt and tg , which completes the half of pattern. The other half can be obtained in a similar manner or by duplication.

The pattern of oblong part of offset, as shown by $C D E F$ of elevation, or $N O P Q R S$ of plan, can be obtained from Figs. 1 or 2, as may be desired. To avoid a confusion of lines the half pattern is obtained, as shown in Fig. 8, in which $C D E F$ represents the elevation and $D N O P E$ the half profile. To obtain the half pattern proceed as follows: Divide $N O P$ of profile into any convenient number of parts, as indicated by the small figures. Place the T-square parallel with $C D$, and, bringing the blade successively against the several points in the profile, drop corresponding points on the miter line $C F$, as indicated by the dotted lines. On $D E$ extended lay off a stretchout of $D N O P E$, and through the divisions draw the usual measuring lines, as shown. Place the blade of the T-square

parallel with $A B$, and, bringing the blade successively against the several points in the profile, drop corresponding points on the miter line $B G$. On $A H$ extended, as $H'' A''$, lay off a stretchout of $A M H$, and through the points thus obtained draw the usual measuring lines, as shown. Place the blade of the T-square parallel with the stretchout line $H'' A''$, and, bringing it against the several points in $B G$, cut corresponding measuring lines. A line traced through the several points thus obtained, as indicated by $G'' B''$, will form the desired pattern.

The Star Coupler Company, St. Louis, Mo., advise us of an order of considerable dimensions just received from the War Department of the United States to be delivered at Madison Barracks, Sackett's Harbor, N. Y. This order is the result of a sample lot sent in December last which were thoroughly tested and which the consulting engineer of the barracks, E. C. Knowlton, reported he had tested and found satisfactory under all conditions. The Star Coupler Company also advise us

ing him for the precious secrets which he claims to possess. The rediscovery of the art of hardening copper, we are told, only failed to make the fortune of the ingenious blacksmith "because of the expensiveness of the process." Will the present alleged discovery prove any more profitable to the author or to the world at large?

The Chilean Government has announced its intention of buying up all the existing railroads in the Republic in order to place them under State management.

Rumors, which have been flying around with some persistence during the week, assert the probability of a consolidation of the great electrical manufacturing interests of the country, including such corporations as the Westinghouse and the General Electric companies, placing them under the control of Standard Oil capital. This new gobble of that omnivorous corporation has received a half hearted denial from several parties interested in the reputed deal, yet the news continues to be reiterated.

THE RETAIL STORE.

Iron Platform for Cisterns and Wells.

The Bucket Pump Company, Cincinnati, Ohio, are introducing an iron platform for cisterns and wells in connection with their bucket pump as here shown. The platform, Fig. 1, is made

Fig. 1.—Iron Platform for Cisterns and Wells.

in two parts, the center portion being hinged, permitting it to be opened at right angles, leaving an opening 16 x 24 inches in size. The platform is corrugated, having an outward fall, also a small flange at the edge of the opening in the movable portion, into which the curb sets, to prevent filth, sediment, debris, &c., coming in contact with the water. The flange is fitted closely to the lower edge of the pump curb to prevent the water spreading and causing the curb to decay. The curb is

the cistern or well, without removing screws, bolts, pump or platform, when it is desired to make repairs either to the cistern, well or pumping apparatus. The curb in such cases is turned back, when the chains swing back out of the way. When the repairs have been made the curb is turned again into position and a cotter is passed through the small lug at the front of the curb to hold the whole firmly in place. The manufacturers refer to the platform as strong, easily placed in position, and as inexpensive.

The Champion Roaster or Oven.

Illustrations are herewith given of a small portable oven which has just been brought out by the Leach Roaster &

Fig. 1.—The Champion Roaster or Oven.

Baker Company of Paxton, Ill. The oven is compact in form and the shape makes it convenient to be used with great advantage on gasoline, gas, oil or

There are numerous uses for small portable ovens of this character which will suggest themselves to those who are familiar with cooking requirements. One special use is mentioned, however,

Fig. 2.—Roaster or Oven in Use.

in the fitness of this oven for camping parties.

West's Dust Pan.

James R. West of Gas City, Ind., is manufacturing the new dust pan which is herewith illustrated. It has a tread extending from the bottom of the

West's Dust Pan.

pan, upon which the foot of the operator can be placed, which holds the pan firmly in position, enabling it to be used with a broom, thus avoiding the necessity of getting on the knees with a brush or stooping over. The pan has a large hood and the handle is very conveniently arranged.

REPRESENTATIVES of the various hardware firms of Milwaukee, Wis., met on the 11th inst., and decided to accept the proposition of the Milwaukee Gas Light Company in regard to selling gas ranges. From April 1 to August 1 gas ranges without water heaters can be bought at about half price and in addition the gas company will set the stoves in position, lay pipe and make connections free of charge. The company will pay to the hardware dealers the difference between the regular price and the new price.

Fig. 2.—Pump Attached to Platform.

permanently attached to the movable portion of the platform, as in Fig. 2, by screws, the position of the screw holes being shown in Fig. 1. This arrangement permits of ready access to

coal stoves. It only requires a moderate heat and is stated to be practically automatic in its functions, requiring no basting. It has an air chamber which diffuses the heat equally throughout.

Porcelain Lined Milk Delivery Can.

The Stuart & Peterson Company, Burlington, N. J., have augmented their line of Golden Crown ware by the addition of the porcelain lined milk delivery can here shown. It is made of cast iron, has a porcelain lining, and is supplied with either glass or porcelain lined iron covers. The article is designed to supersede glass jars and tin cans, over which it is said to possess an advantage, inasmuch as glass jars readily break and tin cans rust, and both have small necks which condense foul odors in cleaning. Another advantage it pos-

Porcelain Lined Milk Delivery Can.

sesses is that it may be placed on a stove and the milk sterilized. It is made in sizes holding one and two quarts.

Stove and Hardware Dealers Along the Hudson River.

BY HENDRICK.

At the foot of the Catskill Mountains and along the western shore of the historic Hudson are many flourishing towns in which will be found enterprising stove and hardware dealers.

At Catskill, N. Y., Day & Holt have been doing business for the past ten years. The firm is composed of J. Day and Samuel Holt. Mr. Day is also secretary of the Catskill Savings Institution, so that he devotes but little time to the hardware business. Mr. Holt can always be found in his office attending to the details of the business. The firm carry a large stock of heavy and shelf hardware, mechanics' tools, agricultural implements, stoves, ranges, &c. Of late they have given up considerable of their floor space to bicycles, which has grown to be an important branch of the trade. The Western Wheel Works' Crescent and the Overman Wheel Company's Victor are the leading goods handled by them. The firm also do a large plumbing, steam and hot water heating business, representing the Boynton Furnace Company of 214 Water street, New York. They have had excellent results from their hot water and steam heaters during the past winter. Mr. Holt is a firm believer in selling one line of ranges and stoves, and during the past four or five years they have pushed the sale of the Rochester Co-operative Stove Company's Red Cross ranges and stoves.

At the corner of Church and Main streets Russ & Beach have been doing business since 1860. They carry a large stock of general hardware, stoves, ranges, &c. Their leading lines of

parlor stoves are the Fuller & Warren Company's, P. P. Stewart and the Splendid Diamond. Probably no other dealers along the Hudson River have sold more West Shore ranges than this concern, their sales running up in the hundreds on this popular range. They enjoy a good trade from the farmers, their place of business being conveniently located at the head of the street where they drive in to town.

Peary & Lobdell, in 1891, succeeded Brooks Brothers, and now occupy the large store on Main street, where they carry a stock of hardware and stoves and do a general tin and plumbing business. They enjoy a large trade on Rathbone, Sard & Co.'s Acorn and Phillips & Clark Stove Company's Andea ranges and stoves. The young men have been very successful since their start in business four years ago.

The Richardson & Boynton Company are represented in Catskill by Adams & Spencer, who do a thriving business in steam and hot water heating, plumbing and tinning. They have built up a good trade on the company's Perfect line of ranges and furnaces.

Henry T. Jones & Son do considerable in tinning and plumbing. This firm are an important factor in the completion of Catskill's plumbers and tinners.

Ten miles up the Catskill Mountain Railroad is the summer resort of Cairo, noted in summer for city dudes and in the winter for its immense snowbanks. It is here that Decker & Olmsted have a model country tin and hardware store. They carry a good stock of hardware, tinware, stoves and agricultural implements, their leading line being the Syracuse Stove Company's Welcome ranges and heaters.

Frank M. Halstead carries on the stove and tin business at Ravens, selling the Fuller & Warren Company's Splendid Diamond and P. P. Stewart stoves.

At the same place is A. M. Stuvill, who sells the Perry Stove Company's Argand line. He also carries a line of hardware, and does a general tin and jobbing business.

J. B. Holmes & Son carry on the stove and tin business at Coeymans. Mr. Holmes senior is an old settler in that part of the country, having started in business long before the late war. He often looks back, and refers to the time when they made their own tinware from plates free from the pin hole difficulty which is so prevalent among the tin plates of to-day. They carry a line of hardware, tinware and stoves, selling the Fuller & Warren Company's line of Splendid stoves, which have had a large sale with them.

At Coxsackie W. R. Church has been in business for many years, and carries a complete line of heavy and shelf hardware, tin, wooden ware and agricultural implements. He enjoys an excellent trade among the farmers for many miles back in the mountains. His leading lines of ranges and stoves are the Rochester Co-operative Stove Company's Red Cross, Van Wormer & Co.'s American heater and D. G. Littlefield's famous West Shore range.

W. A. Edwards occupies a large store on the main street, where he carries on a thriving business, selling the Perry Stove Company's Argand and Orr, Painter & Co.'s Sunshine. "Will," as he is known among the traveling men, pre-

fers at any time to sit with them and tell funny stories rather than to buy goods, and he has many funny ones in store for those who are yet to visit him. He has recently remodeled his store, and it now presents an attractive appearance, and he will, no doubt, continue to enjoy a good trade among his many friends as in the past.

MEMORANDA.

HAMMER & FOWLKES have succeeded to the stove and hardware business at Bakerville, Tenn., formerly conducted by W. H. Fowlkes.

WADE BROTHERS, Prattsville, N. Y., have succeeded A. M. Allen, dealer in hardware, tinware, stoves and crockery.

THE G. S. BLODGETT COMPANY, Burlington, Vt., have purchased the stock and good will of A. B. Kingsland & Co., of the same city, who have been dealers in stoves, tinware, &c., and have also conducted a plumbing, gas and steam fitting establishment. This consolidation makes the G. S. Blodgett Company one of the largest heating and plumbing concerns in northern New England. The latter firm have for a number of years done a large business in the above lines, and besides are known to the trade generally as manufacturers of the Blodgett portable oven, which is especially adapted for use in hotels, restaurants, steamships and large institutions, and is also used for janneting, core baking and the manufacture of confectionery. This business was established over 40 years ago by Blodgett & Sweet. The ovens were first manufactured by this concern and are now known all over the world. This firm continued for 20 years and then were succeeded by G. S. Blodgett and E. P. Manor, under the style of G. S. Blodgett & Co. Ten years later Mr. Manor died and George H. Holden took his place in the firm. The concern were incorporated in 1892 and continue as the G. S. Blodgett Company.

C. SIDNEY SHEPARD & Co., Chicago, Ill., issue a pretty little leaflet with the title "A Few Words About Aluminum and Aluminum Kitchen Utensils." The two inside pages give some interesting facts about aluminum covered by an article recently printed in *The Metal Worker*, from which long extracts are made. On the back of the leaflet it is stated that they have in preparation a catalogue of aluminum articles, some of which they mention by name.

E. E. KOHLER has purchased the stock of hardware of M. D. Comstock, Byron, Mich., and will continue the business and will likewise carry on a tin shop, which has been his line of work.

The returns of the Chief of the Bureau of Statistics at Washington for the month of February show that the imports into the United States during the month exceeded the exports by \$2,017,809. In February, 1894, the exports exceeded the imports by \$11,812,190. During the eight months ended February 28, 1895, the excess of exports over imports was \$91,967,932, and the excess for the corresponding period of the preceding year was \$218,061,832.

The Pennsylvania State Legislature has passed a bill appropriating \$500,000 for the improvement of the channel of the Delaware River.

PLUMBING and GAS FITTING.

Public Conveniences.

The large cities of the United States are wretchedly equipped with public conveniences. The rule to leave the public to provide or do without them is so general that even the exception to prove it is difficult to discover. The need of these public conveniences was never made so clear as by a recent order from one of the public departments of the city of New York. It commands that none of its employees shall enter saloons during working hours, which, on its face, seems commendable. These employees, however, are collectors of ashes, garbage, &c., and would not be permitted to use the urinals and closets of stores, restaurants and hotels by the proprietors. The order has been broken by honest, hard working, well meaning men, who, as a result, have been discharged. If proper public conveniences were provided at frequent intervals throughout the city this hardship would not have been incurred, and owners of property having an open alley or driveway would have fewer nuisances to complain of. The plumbers would do well to bring their influence to bear on this matter.

Universal Urinal Tank.

C. A. Blessing, Philadelphia, has patented and is introducing to the trade the Universal urinal tank shown in the illustration herewith, which is designed for flushing urinals, hoppers and latrines. The tank is simple in construction and is described as being absolutely reliable in operation. The

Universal Urinal Tank.

parts are few in number. There is no ball cock used, the water entering by the supply pipe and cock seen at the right of the cut. The valve is operated by a balanced lever controlled by a fork which is combined with the valve stem. When the water entering the tank reaches a point about 1 inch from the top the ball float reaches its highest point and the end of the fork nearest the ball strikes a lug on the

front of the weighted lever balance, causing it to fall on the disengaged end of the valve lever and thus open the outlet. As the water is discharged and the float falls, the fork from the other side turns the balance weight over again, thus closing the valve. The tank then fills for another discharge. The discharges are regulated by the supply cock, which may be set to admit more or less water according to the number of flushes required. The tank fittings are adapted to small tanks as well as large by simply bending the fork to bring the ends closer together. The tanks are furnished in cherry, ash, oak, maple and walnut.

James M. Heatherton.

The many friends of James M. Heatherton in the plumbing trade will learn with regret of his death on March 20, at his home, 773 Monroe street, Brooklyn, N. Y. The funeral services will be held at the house at 1 30 p.m. to-day. Those who desire to attend should take the East New York elevated road at the Brooklyn Bridge and stop at Gates avenue station. Mr. Heatherton was born at Albany, N. Y., in 1841, and at an early age was apprenticed to Ridgway & Rues of that city, at the plumbing trade. He left their employ and opened a plumbing shop in New York in 1859, where his trade grew, and he at one time ran three shops at 159 Mercer street, 35 Ann street and at 1690 Third avenue. He continued in the plumbing business until 1887. Among his notable jobs was the plumbing in the Post Office Building, which is now being remodeled. In 1880 the *Plumbers' Trade Journal* was started and later occupied his whole time. Mr. Heatherton entered the late war as a private, but rose to the rank of colonel at its close, and was a member of a

number of social and secret societies. He leaves a widow, three sons and four daughters.

SANITARY EXPERT THOMAS S. AINGER of Detroit has made his report to the Board of Health of Saginaw, Mich., and strongly condemns the sanitation of the court house and jail. The supervisors will be called upon to remedy the defects as speedily as possible.

The New Era Siphon Closet.

A new combination siphon jet water closet is shown in the picture herewith, and is called the New Era by the manufacturers, the John Douglas Company, 162-166 Poplar street, Cincinnati, Ohio,

The New Era Siphon Closet.

who also have a branch house at 131 Lake street, Chicago, under the management of Geo. L. Bottom. The closet is of ornamental design, and so constructed, it is claimed, that it works noiselessly, discharging its entire contents at once. The wood work in the seat, flush tank and bracket support is well finished and in a way to stand hard service. The seat and cover are detached from the closet and supported by means of brackets secured to the wall. For roughing in, 12 1/2 inches should be allowed from the face of the wall to the center of the outlet of the closet. Every closet is tested and all the metal trimmings are nickel plated.

THE Board of Health and plumbers' inspectors of Cohoes, N. Y., held a joint meeting last week and adopted a set of rules and regulations similar to those in use in Troy. The rules were ordered printed in pamphlet form and published in the city newspapers. Following the joint meeting a meeting of the plumbers' inspectors was held and a committee consisting of Messrs. Bottom, Cady

and Swatling was appointed to draft by-laws, &c. The board also decided to visit the Troy Board of Plumbers' Inspectors and get an idea from them what was necessary to be done and have their duties defined.

The Mosely Circulating Water Heater.

The Mosely Folding Bath Tub Company, 161 South Canal street, Chicago, have brought out a new water heater, which is herewith illustrated. It is designed for use in connection with a range boiler, and is furnished with Mosely's improved gas, gasoline or oil burner, as desired. It contains 32 feet of copper coil. The illustration shows the method suggested for its use.

The Mosely Circulating Water Heater.

When connected in this manner the range or water heater can be used separately or at the same time. This method of connecting the heater affords the advantage of furnishing hot water at once and always drawing the hottest first. The manufacturers claim for this device high heating efficiency and minimum consumption of fuel. It is made in three styles of finish—polished black iron jacket, polished copper jacket and copper top, or nickel plated copper jacket and nickle top and fittings.

THOMAS J. CUSACK has removed from Fair street to his former old store, 45 North Front street, Kingston, N. Y., which he is having thoroughly renovated and improved. The basement is being converted into a modern workshop, while the main floor or display room is undergoing decided changes. One section will be devoted to an exhibition of garden hose and another to steam and hot water ranges, &c. A special feature will be one of the large show windows, which will be constructed and furnished like a modern bathroom.

Operation of Siphon Closets.

From S. C. P. C., Sioux City, Iowa.
—Will *The Metal Worker* be kind enough to give a theoretical explanation of the operation of a siphon tank and closet?

Answer.—The various tanks in use have many different kinds of valves, all operating on the principle of using the pull to put the valve in operation. Water from the tank rushes down the flush pipe to the closet, and if the pull is released at once the valve will resume its seat, and water will be drawn through an inverted U-shaped pipe or some construction answering the same purpose by siphonic action, and will continue until the water in the flush tank falls below the end of the short leg of the siphon, when the flush will stop and the tank fill up until the supply is cut off by the ball cock used in connection. The water, on reaching the water closet, by its construction is made to thoroughly scour and flush the internal surface of the closet, while a jet enters at the bottom of the trap and shoots toward the trap outlet. The shape of the waterway from the trap to the soil pipe is so arranged as to create a spray and retard the flow of the water through it so as to flush and fill the waterway from the closet to the soil pipe. Then, through a larger surface of water being exposed to atmospheric pressure in the closet than there is at the soil pipe, a siphonic action is induced and continued until the contents of the closet have been disposed of and the siphonic action broken. This occurs before all of the water from the flush tank has escaped and the after flow seals the trap.

Burst Pipes.

A plumber corresponding with an English journal in reference to pipes bursting from freezing gives an interesting account of some experiments as follows:

For trial, any strength pipe would do, but for a simple demonstration, take about 20 feet of light $\frac{1}{2}$ or $\frac{3}{4}$ lead pipe. Put a stop tap at one end and a bib tap at the other. Fill this pipe by a hose, shut the bib tap, then the stop tap tight, double the pipe with an easy bend, cut a hole through a wall into a warm room, then put the double pipe inside with the taps outside, and gradually draw them out about 1 foot at a time to allow them to freeze up from the taps, and by the time the pipes are nearly all drawn out the burst will take place in that part not frozen or last to freeze.

Again, take the same pipe, filled as before, and draw out one end only; the burst will then take place at the end not frozen or last to freeze close to the tap inside.

Again, take the pipe and fill it, then put the end with the bib tap inside. Open it, put a bottle or can to catch the water, and then draw out as before, and as it freezes it will push the water into the bottle, and no burst can or will take place on any part of the pipe swollen.

Again, take the same pipe as before, shut off both ends, expose it equally,

all at once, to frost; no burst will take place, but the pipe will be slightly expanded.

The expansion caused by freezing is great, and will burst almost anything. Why? Because there is no vent or escape for the pressure of the water; but if a passage is kept open to the center, or the last place of freezing, no burst will take place, not even a bottle, if it could be attended to.

Take a simple test, as I have done—a water butt; let it freeze, and before it is half frozen it will burst the butt. But keep the center open with a small iron rod, and though it may get solid, it will not burst. Why? Because the hydraulic pressure is taken away.

Burst pipes are caused by expansion in freezing and forcing the unfrozen water between two given points, and by hydraulic pressure expanding the pipe until it is relieved by a vent.

It is on this principle that pipes are burst by the sudden stoppage with the old fashioned half turned taps. Hence the introduction of the screwdown taps. This I have experienced many times of old when the high pressure of town water was introduced. The burst in these cases is exactly like that by frost.

TRAPS AND VENTS.

REPRESENTATIVE REVELL has prepared, and will introduce into the Illinois Legislature at the first opportunity, says a Chicago daily, a bill to compel gas companies to supply to consumers prepayment meters. The prepayment meter is operated on the slot machine plan. The consumer drops a coin in the slot and a certain quantity of gas is produced. These meters are in use in some of the cities of Europe. It is estimated that if this bill becomes a law it will involve an expenditure for meters by Chicago gas companies of about \$5,000,000.

THE PROPERTY of the Cleveland Gas Fixture Company was recently purchased in the Probate Court and will be operated by a new company to be known as the Cleveland Gas & Electric Fixture Company. The new company elected officers recently as follows: President, R. E. Gill; vice-president, Bernhard Schatzinger; treasurer, B. G. Tremaine; secretary, H. L. Taylor. The officers and L. Poplowsky constitute the Board of Directors.

DENNISON, OHIO, it is reported, has raised \$30,000 and secured 20 acres of land which is to be used as an inducement to James B. Clow & Son, Chicago, to locate their pipe works there, their works at New Philadelphia having been destroyed by fire.

JOHN VAN DE VELDE has moved his plumbing and steam heating establishment to 27 East Third street, Danbury, N. Y.

B. P. CONNEALY has been appointed Pumping Inspector at Waterbury, Mass.

JAS. F. DUFFY, 124 Main street, Hartford, Conn., has been fitting up his store in a handsome manner so as to display to the best advantage the fine plumbing fixtures, including porcelain tubs, marble lavatories, closets of various kinds and the accompanying nickel work. In the heating line he carries the boilers made by the American Boiler Company.

SINCE ZALMON GOODSELL has become president of the Builders' Exchange, Bridgeport, Conn., the membership has grown from 10 to 70, and the value of the exchange is being appreciated.

GEORGE H. FARRELL, Westfield, Mass., has repaired the damage done his plumbing establishment on Arnold street by fire, and is ready for business again.

THE CITIZENS' GAS COMPANY, Bridgeport, Conn., will establish a plant as soon as possible to supply fuel gas to factories and dwellings.

R. D. WALLACE and H. J. PLOCK have arranged to open a plumbing, steam and gas fitting establishment in Seneca Falls, N. Y.

ALLEN & WARD, Athol, Mass., have made extensive alterations and enlargements at their plumbing shop in Car-dany's Block.

THE PLUMBING SUPPLY HOUSE of Geo. D. Kimber & Co., Brooklyn, N. Y., sustained damage last Sunday night from water used on a fire in the upper part of the building they occupy.

F. J. STURN, Newark, N. J., has taken a store adjoining his plumbing establishment, which he will fit up as a showroom for gas and electric lighting fixtures, and will make a fine display of modern plumbing fixtures.

S. B. PARKER of Goldboro, N. C., who has been running a plumbing and tinning business for 15 or 20 years, has opened a branch in New Berne, with headquarters on Craven street.

ACCORDING to newspaper report electric heat has been applied with success to the thawing out of frozen water pipes in England. A wire is run into the pipe until it meets the obstruction, and then the current is turned on.

E. L. POWELL, Atlantic Highlands, N. J., was a visitor at *The Metal Worker* office this week. Mr. Powell has invented several devices that have proven useful to the plumber.

C. H. ROLLINS is remodeling his plumbing store in Watertown, Mass.

PLUMBING INSPECTOR SIBBEN of Kansas City, Mo., has prepared a new plumbing ordinance. The old law contains some sections which, although good when written, are now said to be objectionable. A meeting of master plumbers took place last week to discuss the new ordinance. The two chief bits of contention were the proposed examination of plumbers as to qualification and outside sewer drains from the basement, with fresh air inlets, instead of a circulation pipe through the roof. It was voted to require the circulation pipe. At present the law requires a fresh air inlet on the soil pipe between the main trap and the house. It is claimed that the extension of a pipe or stack through the roof will vent vapors and stop a nuisance that the old system causes. Another interesting point is that of prohibiting unflushed vaults along the lines of the sewers. Health Officer Waring contends that the thousands of unflushed vaults are the gravest menace to public health.

LE BLOND-MATTOON PLUMBING COMPANY have been incorporated at Sheboygan, Wis., with a capital of \$5000. The incorporators are Sarah Le Blond, E. B. Mattoon and Emma G. Mattoon.

THE MASTER PLUMBERS of Cleveland, Ohio, met last week in the rooms of the Builders' Exchange and listened to the report of Daniel Roberts, chairman of the committee which represented the Cleveland organization at the recent convention of the master plumbers in Cleveland. The master plumbers desire to bring about State and national

legislation which will establish uniform rates and methods for plumbing.

THE WHITAKER SUPPLY WORKS, Kokomo, Ind., manufacturers of plumbers' brass goods, have sold out to Henry Goelitz of Chicago, who will immediately double the capacity of the works.

AMONG the new plumbing establishments that have recently been established in Chicago can be mentioned the following: D. G. Monteath, 1558 West Harrison street; Thomas M. Joyce, 32 Pine street; John G. Henzel, 3506 Vincennes avenue; Mark Abrahams, 3456 Cottage Grove avenue; E. F. Anderson, 286 Western avenue; F. P. Gleason & Son, 12 Quincy street; Machalitzky & Luria, 885 Twelfth street; Levy & Son, 4009 State street; Henry Schmidt, 3463 Irving street; Wilson Sanitary Plumbing Company, 3341 State street; William F. Reimneeth, 4849 Hoyne street.

AT A MEETING, last week, of the Shuster Foundry Company, South Pittsburg, Tenn., F. H. Shuster of Philadelphia was elected president, and Joseph Lodge of South Pittsburg, vice-president.

THE CITY COUNCIL of Kokomo, Ind., has taken preliminary steps toward putting in an entirely new system of sewerage during the coming summer, which will provide employment for some hundreds of laborers.

"THE MONSON MAINE SLATE COMPANY" is the title of a neat brown covered pamphlet calling attention to the products of this well-known company, whose Boston office is located at 113 Devonshire street. The first pages give prices, with list of sizes and other particulars, of Monson Maine unfading black roofing slates. Then the company refer to their slate stone products for other purposes, such as urinal stalls, blackboards, wainscoting and capping tile, kitchen sinks, cisterns, laundry tubs, bathroom and vestibule floors, closet seat slabs, register borders, &c. Accompanying the tables are prices and likewise circulars, in which the company give further particulars of these goods.

ARTHUR F. MAYHEW has gone into the plumbing business and opened a shop at 5 Lowell street, Peabody, Mass.

E. T. FORD has opened a steam and hot water heating and plumbing shop at Hanover, N. H.

ROW & BENZ, plumbers, 258 South Ninth street, Reading, Pa., will dissolve partnership, and Mr. Benz will continue the business at the present place. Mr. Row will engage in the same business April 1 at 216 South Ninth street.

IN *The Metal Worker* of March 2 we announced the dissolution of the firm of Hughes & Stephenson of Montreal, Canada, and said that W. A. Stephenson retired from the firm. This may have given the wrong impression that Mr. Stephenson was going out of business. This is not the case, however, for he has leased the premises at 36 Victoria square, corner of Craig street, Montreal, Canada, where under the firm name of W. A. Stephenson & Co. he will carry on a general plumbing, heating, gas fitting, lead burning and electric business. In his announcement he states that he enjoys special facilities for purchasing goods from the leading manufacturers, and has in his employ skillful and practical workmen in the several branches.

N. S. & P. C. STEWARD, plumbers and steam fitters, have leased the Littlefield Building on Elm street, Skowhegan, Maine.

THE CITY COUNCIL of Springfield, Ill., have passed an ordinance providing for the supervision of plumbing and drain laying, for the registration of plumbers and drain layers, to define the powers and duties of city officers and the duties and obligations of registered plumbers and drain layers and to authorize the collection of fees for inspection.

Wade's Plumbing Specialties.

J. J. Wade & Son, 276 Dearborn street, Chicago, have just brought out a fine catalogue of J. J. Wade's plumbing specialties. Mr. Wade is a most progressive and enterprising plumber, with the happy faculty of putting his ideas in practical shape for the benefit of the trade generally. His inventions have been brought out from time to time and quietly placed on the market. They have been known to be quite numerous, but even those most familiar with them will be surprised to learn how wide a field they cover, as shown collectively in this catalogue. The contents begins with the Accessible sewer flushing fittings, the object of which is to make the sewer pipe for house drainage always accessible throughout its length, as well as capable of frequent flushing at traps and other points likely to be fouled. The fittings connected with this system are of great variety, to cover every possible requirement. Then follows the Wade patent sectional flushing iron catch basin, built in sections, which can be bolted together, making a basin of any depth desired. The frequent flushing idea extends to this device also. Next comes the Wade accessible flushing iron catch basin, adapted for better blow off, drainage, or for all purposes requiring tight basins. This is supplemented by a sink flushing grease catch basin ejector. Another important improvement is the Wade automatic cellar drainer, for removing water from cellars, excavations, wheel pits, &c., which is operated by water pressure. An illustration is given of the Wade lead burning system, to join the edges of sheet lead or lead pipe so as to resist the action of acids. Next follow lead lined iron ventilation, soil, waste and supply pipe and fittings. The concluding pages illustrate the Wade siphon jet water closet, Centennial pedestal closet, Purity washout closet, Columbian flush rim hopper, Delaware lavatory, Delaware secret waste basin, Delaware plug basin, automatic basin lock valve trap, Delaware lavatory plug basin, Purity basin, &c.

THE PHILADELPHIA STEAM HEATING COMPANY, 1513 Filbert street, Philadelphia, have the contract for placing an extensive steam heating plant in the Real Estate Trust Company's building at 523 Chestnut street. It will cost \$6000. They will also put a \$2000 plant in the St. Thomas parish school building at Eighteenth and Fernon street.

A FIRE STARTED in a neighboring planing mill destroyed the Baldwin Refrigerator Company's factory, Burlington, Vt., on March 19. The company's loss is reported to be fully covered by insurance.

GROUND has been broken at Tifton, Ga., for a new iron and brass foundry.

ROOFING AND CORNICE.

Berger Bros.

231 and 237 Arch street, Philadelphia, have just issued what they claim to be the largest catalogue ever published in this country covering a line of tinners' hardware and roofers' supplies, pipe, pipe hooks and fasteners, furnace fittings and kindred goods. The catalogue contains 128 pages of heavy enameled paper, well printed and plentifully illustrated. Following the title page is an introductory announcement to the trade, in which the firm's appreciation of the patronage hitherto extended to them is expressed, as well as their intention to merit its continuance. Page 3 carries the terms under which they do business. The catalogue proper commences on page 4, which page with its follower is devoted to joint gutter. Next in order come miters and roof gutters, quarter circle, O. G. and box gutters. Gutter hangers follow, a large variety being shown. Page 13 and two following pages show Berger's new hinged shanks and circles, on which a patent is being sought. These shanks are claimed to combine great strength and variation, and allow the stems to hang close up to the cornice and the circles close to the shingles; several styles are shown, as well as suitable materials for their application. Trough and gutter hangers and fittings are next shown. Pages 20 to 25 are devoted to corrugated expanding, lock seam and spiral lock seam conductor pipe and fittings, and cast iron header shoes and sewer connections. Two pages are assigned to rain water cut-offs, filtering joints and strainers. Eight handsome designs of conductor heads follow, the designs being now published for the first time. Pipe fasteners and holders of all kinds occupy upward of eight pages. One page shows the B. B. pipe hanger, an entirely new article for use in a great variety of ways, above floor or under ceiling and side walls; it is said to be adjustable to any distance for single or twin pipes and is made in either plain or polished metal. Pages 38 and 39 show expansion bolts, stove bolts and rivets and burrs; and the two following pages cover sundry supplies and tools. Pages 42 to 66 are devoted to a general line of tinners' hardware, including cars, handles, shanks, rings, can screws and bottoms, knobs, stove turn buckles, roof irons and collar clamps; coffee pot and sad iron stands; lifters, lemon squeezer, valves and plungers, and speaking tube and fittings. Considerable space is awarded to sheet iron and zinc, corrugated sheet iron crimp roofing, pressed steel brick and rock face brick siding, roll steel roofing, continuous tin roofing, felt roofings, sheathings, asbestos felt, metallic paints, roofing and furnace cements. Pages 78 to 85 contain furnace fittings of all kinds, dampers being especially prominent. Coal hods, water buckets, stove shovels and pokers occupy two pages. Chimney ventilators and caps take up four pages; then follow galvanized iron ridgings; crestings, cresting blocks and finials are displayed on pages 94 to 111, many new and original designs being

shown. Galvanized iron cornices next appear, succeeded by hot air registers. The remainder of the catalogue is devoted to tools and articles of a miscellaneous character. A feature of the book is the number of fine illustrations used, the smallest article being deemed worthy of pictorial representation. The catalogue is bound in stiff paper covers of dark green color, having the firm's name and address on the front, embossed in gold, their lines of goods appearing within a conqueror's wreath, also in gold. The back page bears the firm's well-known trade-mark contained within a scroll. The firm will distribute the issue only to such tinners, tinware manufacturers, roofers, plumbers and architects as apply for them.

FLASHINGS.

POWERS & WILLIAMS, Streator, Ill., issue an eight-page circular calling attention to the line of goods which they manufacture and sell. The front page shows two styles of galvanized iron vases, while the next four pages show a number of different cornices, the dimensions and prices of which are given. The styles vary from the plainest kind of cornice to quite an elaborate construction. Other goods noted are crestings, skylights, chimney tops, window caps, &c.

A LITTLE memorandum book that will be useful for vest pocket purposes is issued by the Burdick Mfg. Company, manufacturers of roofing, cornices and skylights, who are located at 312-314 John avenue, West Superior, Wis. At the top of the blank pages are printed references to their business.

JOHN SEVERDING, Richmond, Ind., is making a new strap eave trough hanger which he commends to the trade. The hanger is very simple in design, and it is especially mentioned that it utilizes the narrow strips of galvanized iron and tin that have heretofore been thrown into the dump. The features of this new hanger are that it is particularly strong and substantial, being made of No. 15 hoop iron and wide strips. The cross bar is $\frac{1}{2}$ inch wide and a $\frac{1}{2}$ -inch strap goes around the gutter. The upright on the roof strip is $\frac{1}{2}$ inch wide, while a $\frac{1}{2}$ -inch strap goes through a slot at one end and is fastened with a rivet, and for this strip the galvanized iron or tin scraps are utilized.

LANDELL & SKELTON is the name of a new firm at Fayetteville, Ark., organized to deal in roofing and cornice materials, &c.

THE WHEELING CORRUGATING COMPANY, Wheeling, W. Va., have just issued their catalogue D 169. It is a volume of convenient size, handsomely published, bound in dark blue heavy paper, and contains 112 pages. In an introductory note, referring to the quality of their product, they state that their corrugated sheets are made from the best quality of iron, while their rolled roofings are made from the best

quality of steel, their pressed standing seam and V-crimped roofings being made of semi-steel. They state that they will not fill orders for this roofing of common iron, as it will not give satisfaction to their customers. The first goods noted are corrugated sheets. Illustrations are presented showing the style and size of the corrugations, and a few pages are devoted to directions for applying corrugated roofing to wooden framing. A variety of other corrugated sheets are shown. A new feature of the present catalogue is the steel roll and cap roofing with protected cleats, which is illustrated by a section of a roof showing the method of applying the sheets and their appearance when laid. With this are full particulars telling how to apply the roofing. Similarly steel roll and cap roofing with galvanized or outside cleats is illustrated and described. These are followed by other styles of roofing, pressed standing seam, V-crimped, &c. Among new goods are steel rock faced brick siding and steel stone siding, of which illustrations are shown. A few pages are devoted to their tin plates, of which they give a list of brands, $\frac{1}{2}$ x 24, &c. In the section devoted to conductor pipes there is shown corrugated square expanded conductor pipe made in 10-foot lengths, in addition to the others previously illustrated. Among the miscellaneous goods of interest to the roofing trade is the Rainbow rain water cut off, which is described as the best cut off made. Following these are shutters, eave troughs, hangers, &c. A new chapter in the catalogue of the Wheeling Corrugating Company is devoted to malleable crestings and finials, of which many pleasing designs are shown. Galvanized cresting blocks, hip caps, finials and vanes are likewise illustrated, the whole covering over 20 pages. Skylights with frames of galvanized steel or copper are illustrated, and a number of sections of crown moldings and raised moldings are presented. Following a section on cornices and miscellaneous goods comes a chapter devoted to their patent continuous steel ceilings and slide wall finish, of which some new and very handsome designs are shown. At the end of the volume is an alphabetical index.

WE ARE advised that the Old Bangor Company of Bethlehem, Pa., have joined the new organization, known as the Bangor Roofing Slate Manufacturers' Association, to which reference was made in our issue of last week. Thus all the manufacturers of genuine Bangor roofing slate are now united, and the maintenance of a uniform scale of prices in the trade will be secured.

THE PLANT of W. H. Mullins, Salem, Ohio, manufacturer of sheet metal and statutory work, is being equipped to burn oil by the system of the Thurman Fuel Oil Burner Company of Indianapolis, Ind. The furnaces, which will be used to anneal copper and zinc and to melt lead and zinc, will be 50 x 11 feet in size. Waste heat from the melting pots will heat the copper and annealing furnaces.

THE LATEST souvenir that has been issued by Gummey, Spering & Co., Philadelphia, is a most serviceable rule, and one that will be most appreciated by architects, for whom it is specially intended. The rule, of celluloid, is 12 inches long, folded in the middle. The advertisement is very simple and merely calls attention to Pennsylv Old Method, described as the finest quality of American roofing tin, and the Alderly brand is spoken of as a very choice quality of heavy coated roofing tin. The rule, which as mentioned is particularly for architects' use, is divided into 12 inches

foreign competition in the iron and steel trades, with a view to devising measures for the maintenance and stiffening of prices.

No. 20 Power Pipe Machine.

To meet a demand for a machine in which when the pipe revolves the dies are stationary, Curtis & Curtis, Bridgeport, Conn., have designed and placed on the market the machine herewith illustrated. A special feature to which the manufacturers allude is that all

clamped in position. The back stop shown on the right side of the die head is run down over the pipe, and the pipe cut off by turning the wheel on the side of the die head. All this cut off arrangement is self-contained and allows a movement within ways, so that if the pipe should be slightly bent or out of round it would move with it, and thus facilitate the operation. Should it then be desired to thread this end of the pipe, the lever shown on top of the die head is thrown over to the proper graduation on top of the machine, which brings the dies to the standard size for the size of pipe to be cut. Should there be found that the fittings to be used varied from the standard, the proper allowance can be made with this lever so as to cut over or under standard size. Should there be a number of pieces of the same size to be cut, as in making nipples, the block into which the lever engages can be set to size and the lever simply snapped back into it each time without resetting. This feature is of particular value where the machine is operated in a dark room or where unskilled labor is employed. The die-carrying head is then advanced by turning the hand wheel shown on the front of the machine, operated through a rack and pinion under the die head, and the dies lead on to the pipe. When the dies have advanced as far as desired the top lever is thrown back, which frees the dies from the pipe, the die head is drawn back and the pipe is removed without running back over the thread. This machine is arranged with two sets of gearing for rotating the spindle and pipe, each of which is adapted to give a different speed to the machine. A change of speed from one to the other is obtained by simply moving a convenient lever while the machine is running at full speed and without being obliged to stop. This feature, it is said, will be found of special value in changing from threading to cutting for where a higher speed is desirable. With a change of belt speed on the cone four speeds of machine are obtained. When desired the machine is fitted with a hand wheel which is attachable to the cone shaft, thus allowing the machine to be operated by hand power. Solid pipe or bolt dies can be used with this machine when desired.

No. 20 Power Pipe Machine.

and along each edge the divisions are made for different scales. On one edge is the $\frac{1}{4}$ inch to the foot scale, together with the ordinary even scale of 12 inches. On the other edge are two scales, one $\frac{1}{2}$ inch to the foot and the other $\frac{1}{4}$ inch to the foot. These are the common scales in use, and the rule is so plainly marked that its usefulness will be apparent to every one who is the fortunate obtainer of one.

A circular has been issued by the Scottish Iron and Steel Workers' executive to all trades unions in Great Britain connected with this industry suggesting that a conference of delegates should be called within the next three months to consider the question of home and

parts are made interchangeable so that duplicates can be readily secured. The gears are all cut from the solid block, and all working parts, it is stated, are finely finished to gauge. To operate the machine, the pipe to be cut off or threaded is run through the hollow spindle of the machine from the left, passing through the self-centering guide chuck shown at the left of the spindle and the self-centering vise at the right, and the die head. The pipe is then clamped by turning the screw in the vise, which not only clamps the pipe, but brings it central with the dies; by turning the hand wheel shown on the front of the machine the die head is moved so that the cut off tool comes opposite the point on the pipe where it is desired to cut, and can there be

United States Consul Bruhl, at Catania, Sicily, suggests to the State Department what he considers may be a good opening for American trade in that island. It is for the building of small frame houses of from three to five rooms, such as we usually term cottages, which can be shipped from this country for eventual erection in Sicily. Mr. Bruhl is led to the belief that this industry could be established and carried on profitably from the fact that in that country the frequent earthquakes damage and destroy the houses erected there, the builders not being sufficiently advanced in the building art to be able to meet the demands in their construction. Relying on the superior facilities of the American builder and the workmanship that would be used, the consul is convinced that the people there would readily adopt the American structures, as better calculated to resist the frequent shocks. He has interested himself in the subject to a considerable extent, and is anxious to obtain illustrated catalogues and other information from American manufacturers and builders to lay before the Royal Earthquake Commission, with a view to having the experiment tried.

TIN PLATES.

The Proposed Restriction of Welsh Tin Plate Production.

The close of the present month promises to prove a period of critical importance in the Welsh tin plate trade. On March 31 expires the term of the arrangement whereby the men at a number of the works in South Wales agreed to accept a temporary reduction of wages, averaging about 12½ per cent. When this agreement was arrived at the manufacturers were in hopes that an improvement in business might occur in the interval and that prices might advance to a more profitable level. Neither of these expectations has been realized. Business has, if anything, declined in volume, mainly on account of the slackness in the demand for tin plates from this country, and prices have dropped from 3 pence to 6 pence a box. Consequently the makers are in an even worse position than they were at the opening of the year, and are now in no condition to restore the old wage scale. The men on the other hand seem disinclined to a continuance of the present scale of payment unless their working time is reduced. According to the latest advices from the other side, the two interests are endeavoring to agree on a compromise. But the obstacles to any arrangement which will be agreeable to both the employers and the Tin Platers' Union are said to be considerable.

It seems to be generally conceded that a restriction of output is imperative. Judging by the business done last year, the productive capacity of the active Welsh works, even if limited to 36 boxes a turn per mill, exceeds the present average demand to the extent of about 100,000 boxes a week. This represents the surplus production which, accumulating, glutts the market and causes constantly falling prices. To avoid this evil, the newly formed Board of Control in the tin plate trade, composed of a number of the leading manufacturers, has suggested that in order to assimilate the make to the demand, production should, after March 31, be reduced one-third of the capacity throughout the entire number of mills. To make this rule effective it is proposed that every third week should be a "stop week."

This proposition has received the approval of a large number of the makers and, in principle, is favorably considered by the union. The main obstacle, however, to its general acceptance lies in the fact that the manufacturers who are most strongly pushing the plan happen to be those who at one time or another have been connected with tin plate ventures in the United States, and an impression has got abroad among many of the makers as well as the men, that these persons are not working for the best interests of the Welsh trade. As, however, nearly all of them are stated to be no longer financially connected with the American industry, the prejudice seems to be somewhat unreasonable; still, it exists, and as Welshmen are notoriously tenuous of a once

formed notion, the impression is regarded as likely to operate against harmonious action on this line.

The executive of the Tin Platers' Union have meanwhile issued a manifesto to the tin plate workers of South Wales, Monmouthshire and Gloucestershire, in which they approve the plan for the proposed assimilation of supply to demand by the stoppage of one-third of the capacity throughout the trade provided the men divide the work. "Employers of standing," runs the circular, "agree that this is practicable, and further contend that the action proposed will have the effect of advancing prices, and while we will be no party to secure artificial prices, which may encourage American competition, we submit that it is as much your duty to help employers to get fair prices as it is for yourselves a living wage. We welcome the assistance of employers and trust that few will be found so inhuman as to oppose this solution of our unemployed difficulty and their folly of having to sell plates under cost; but we wish to make it clear that our hopes and reliance rest upon tin platers realizing in due time their best and truest interests. Wage reduction agreements terminate at the end of March. You will be tempted to extend these arrangements. We ask you on no condition to do so unless your employers contract with you to permit two-thirds time being worked. If a successful stand is thus made, in all likelihood the standard wage rate will be yours within a short time and you will agree that to work six hours' shift with a full wage rate is better than working eight hours' shift with 12½ per cent. reduction. . . . Your executive in this way opens a course before you, which, if followed with the determination and enthusiasm characteristic of tin platers, will aid in removing misery and suffering, restore uniformity of conditions and do away with that mad competition destructive to the employer and intolerable to the tin plate workman."

A further conference between the manufacturers, represented by the Board of Control and the representatives of the union, is to take place, it is understood, before the end of this month, when strong efforts will be made to arrive at a basis of agreement. Want of sympathy with promoters of the present movement on the part of a large number of people in the trade is thought, however, to be adverse to any effective joint action. A strong party is said to be still desirous of raising the price of plates to a basis of 10 shillings and 6 pence or 11 shillings a box, while others again propose that by mutual concessions on the part of employers and employed, the former contenting themselves with no profit and the latter accepting a further substantial reduction in wages for a fixed period, the price of plates might be reduced so low as to practically kill American competition. Both these schemes are regarded, however, as unworkable in effect, and except for the prejudice in regard to its source, before mentioned,

the proposition offered by the Board of Control seems to be the only one that would command the assent of a majority of the makers and workmen.

SCRAP.

TWO OF THE black plate mills recently built by Ains-Standard Iron & Steel Company, Bridgeport, Ohio, have been put in operation, the first black plates for tinning having been rolled on Thursday morning, the 14th inst. Two others are about ready, and are expected to be rolling black plates within the next two weeks.

THE WHITAKER IRON COMPANY, Wheeling, W. Va., have started up four sheet mills which have been idle for the past six or eight weeks. Two other sheet mills in this plant, which have been working right along, have been closed down.

THE TINNING department of Meurer Bros. Company's works, 575-577 Flushing avenue, Brooklyn, which has been closed down for alterations and repairs, will start again into full operation on Monday. Messrs. Meurer report a good demand for their various brands of American tin and terne plates.

THE MACHINERY has all been received and is now being placed for the new works of the National Tin Plate Company, North Anderson, Ind. It is announced that the works will be in operation by May 1. When completed they will employ some 750 men.

THE ANDERSON FOUNDRY & MACHINE WORKS, Anderson, Ind., shipped last week three carloads of tin plate machinery to the new plant of the Monongahela Tin Plate Company, Pittsburgh, and one carload to that of the Great Western Tin Plate Company, Joliet, Ill.

THE TIN PLATE PLANT of the La Belle Iron Works, Wheeling, W. Va., is fast approaching completion. The machinery is being installed, and it is expected that the works will be in operation by May 1.

THE BOARD OF TRADE, Beaver Falls, Pa., has succeeded in raising nearly the whole of the \$20,000 bonus for a new tin plate mill, which it is proposed to locate at that place.

THE WASHINGTON IMPROVEMENT COMPANY of Washington, Pa., a concern who have been organized and chartered for the purpose of promoting the location of industries at that place, have, it is said, practically closed arrangements for the establishment there of a large tin plate mill.

WHEELING CORRUGATING COMPANY, Wheeling, W. Va., have started up a couple of stacks in their new tinning plant. The company purpose making both charcoal and bright tin, as well as roofing plates. According to their latest catalogue, just issued, the firm are making two brands of high grade hand redipped ternes, the Margaret and the Nelson, and two brands of rolled, full coated roofing plates, Elea-

nor and Wylie; besides three grades of bright charcoal and one brand of coke plates. They are also manufacturing and offering to the trade continuous roofing plates in their various brands, as well as flat seam tin roofing and tin valleys and gutters. In this manner they expect to consume a part of the output of their tin plate department themselves. The agent of the Wheeling Corrugating Company in New York City is H. C. Mechling, 81 and 83 Fulton street. They have also branch offices at Chicago and St. Louis.

F. A. VINAL, dealer in tin plate, sheet iron and metals at 124 Purchase street, Boston, Mass., has recently begun importing two special brands of terne plates, namely, Allston and Gem, which he is offering to the trade of New England.

THE FAMOUS BOTALLOCK tin mine in Cornwall, after being worked for over 200 years, is about to be closed, either permanently or until times are better, as it does not now pay to operate it. The Botallock is one of the most famous and frequently visited mines in the world on account of its picturesque situation near the wild Cornish coast and the remarkable engineering features connected with it.

THE MEN employed in the black plate mills of the Monongahela Tin Plate Company, at Pittsburgh, have been organized into the Amalgamated Association.

THE BRITISH BOARD OF TRADE returns for February show a large falling off in the shipment to the United States of black plates for tinning. They were only 451 tons, as against 2977 tons in the previous month. This is probably due to the large increase in the number of American mills producing these sheets which have come into operation since the beginning of the year.

GUMMEY, SPERING & Co., Philadelphia, advise us that they have not shut down their tin plate plant a single working day during the past quarter, such has been the demand for their brands of American tin and terne plates, many of which have become well known and appreciated among consumers. They call attention to a new brand of best bright coke plate, Champion, which they are now offering to the trade.

AMERICAN SHEET IRON COMPANY, Phillipsburg, N. J., are arranging for the addition to their plant of a second black plate mill.

Salt Lake Supplied with Natural Gas.

Salt Lake, Utah, is rejoicing over the final arrival of natural gas, which has been piped from the wells 14 miles distant. The completion of the first connection was celebrated by the illuminating of the main streets with flambeaux turned on at high pressure from the mains at the Temple Block. The supply is brought to the city by an English company and will be connected with the mains of the local gas company, who have contracted to supply a number of large local manufacturers and city consumers at a price low enough to displace coal as a fuel. The wells already improved have an aggregate output of 20,000,000 feet per day. The supply already available is ample for the entire demands of the city for domestic light and heat, with a good surplus for manufacturing purposes.

Capital and Confidence.

In business circles the one achievement which is devoutly hoped for, says *The Iron Age*, is a restoration of confidence. We find that a good many merchants and manufacturers interpret that phrase as a recovery of sufficient nerve among buyers to place more liberal orders, for more extended delivery. We believe that a deeper search will reveal that a sense of security on the part of capital is the most important influence bearing upon it. If that be true, then it needs much to overcome the disastrous effects of the developments of the past two years and the influence of current contentions. A review of recent industrial and commercial history appears to show that success could not have been more complete if the deliberate aim had been to frighten moneyed men into inactivity. Capital is proverbially timid, although it has its spells of reckless courage.

Whatever may be the merits of the questions involved in the great battle of the standards, this one fact will be hardly disputed, that the great majority of moneyed men are either uncompromising "gold bugs" or believe in bimetalism only when it is backed by the unqualified support of all civilized nations. So long as such men see before them the danger that power may pass into the hands of legislators representing what to them are crazy views, capitalists will keep their money idle.

It is curious that the same men who will resort to cajolery and to every means of persuasion to win the confidence and good will of capital when they want it for their own individual use and profit, believe that the best instrument of conviction against capital collectively is the club. The same men who rush to financial centers to secure money for the development of the resources of their native States and Territories at home make ringing speeches against the Shylocks. They recognize the power of money and yet attempt to overawe and domineer capital.

When business men, who ought to know better, resort to such bulldozing tactics, it is not surprising that workmen, piloted by their walking delegates, do the very acts which must prolong the sufferings against which they rebel. Every unreasonable strike, every act of violence, discourages enterprise and drives into the financial centers money, the employment of which would mean work for the idle and the needy. So long as no power exists to force capital into the channels of industry injustice and violence on the part of those who work for their daily bread must rest upon them.

There is another very serious cause for the timidity of capital, be it foreign or American, which should be frankly exposed, and that has been the laxity of business principles which has widely prevailed. The course of the managers of some of our great railroad systems now in the hands of receivers has been outrageous. The deliberate falsehoods uttered on the eve of failure have shocked that large class of security holders who may pardon a loss but never forget deception. The stock-jobbing on the part of officials, the juggling with accounts and the manipulation of corporate interests for private gain are scandals which have discouraged the flow of money into channels into which they went freely for many decades.

Revival can only come when conservative capital has become convinced that the lesson of the past few years has

been thoroughly learned. A speculative spirit can only develop after continued moderate successes have made the timid venturesome. The vast majority of the men speculators and boomers have nothing but the memory of past financial greatness left to them. The men of large means and solid wealth will be the first to seize the many opportunities for successful operations. But they, too, are the most cool headed, the ones who can afford to wait patiently, the ones who cannot be bulldozed, but must be convinced by clear evidence that irresponsible and dishonest attacks upon capital have ceased.

Furnace Fittings.

The Excelsior Steel Furnace Company, 33 West Monroe street, Chicago, have made an important reduction in their price of Furnace Fittings. They are enabled to do this by the lower cost of material, thus giving their customers the benefit of the decline which has taken place since last season. They are now quoting 50 and 10 % discount on the old list, and in addition allow full freight to points east of Omaha and Kansas City on orders of \$10 or over, provided payment is made within 30 days by remittance in New York or Chicago exchange, accompanied by railroad expense bill. No charge for cartage or crating on such orders. Orders of less than \$10 subject to charge of 50¢ for cartage and crating; 2 % extra allowed on bills paid in 10 days. Equally important reductions have been made on their entire line.

The late G. T. Simonds of Fitchburg, Mass., gave the last years of his life to the development of ball bearings. An English company are bringing out his patents abroad. Among them is one to which Mr. Simonds attached much value, and that is the method for hardening the balls after they had been rolled. The object to be hardened is plunged first into brine and afterward into oil. This by itself is not new; but the novelty consists in the manner in which it is done. It is desirable that the object to be hardened should remain for a certain number of seconds in each of these fluids, and that it should pass from one to the other without coming in contact with the air. This is effected by making the bath double, the partition in the middle not extending quite to the bottom. It is then half filled with brine, on the top of which oil is poured on one side only. An endless chain fitted with wire buckets enters the brine at one side of the bath, and passing under the partition, comes out through the oil. The rate at which this chain is driven being decided and the depth of brine and oil regulated accordingly, it is evident that the objects in the wire buckets will remain immersed the exact time required.

THE WINDOW GLASS manufacturers from all over the United States met this week in Pittsburgh and formed a pool to be known as the National Association of Window Glass Manufacturers, whereby they will regulate prices and place the industry on a more profitable basis. The Indiana manufacturers after the general meeting met and advanced prices from 10 to 15 per cent. This action will, it is said, be made general shortly.

STOVE TRADE NOTES.

The Ohio Stove Trade.

Reports from stove manufacturers, in the main, are encouraging, but they are not uniform. A few producers are in the slough of despondency, judging from the tone of their communications, but these advices are from a small section, where the general improvement, so noticeable in other territory, has not been felt. Throughout Ohio and many parts of Indiana, however, come most encouraging reports, the first quarter of the year 1895 showing an increase of 50 per cent. in sales over the corresponding time a year ago, and even comparing favorably with the trade of two and three years ago. One manufacturer writes that business in stoves has been double that of a year ago, and, further, that his company are booking more orders for future delivery than ever before.

But while there is little room to doubt that the volume of business is increasing, it is equally true that profits are not increasing in the same proportion, but this cannot be expected by thoughtful business men.

Not a few stove founders have been farsighted enough to cover probable needs for pig iron by purchasing supplies for delivery during the next few months, thus protecting themselves against any advance in prices which the present buying movement of pig iron may create. Up to the present time, however, the pig market has been in favor of consumers, and the advance anticipated by furnaces has not been realized, but the indications at the moment are certainly for a hardening market.

Industries other than stove foundries dependent largely upon iron in this section are improving decidedly, and the activity previously noted in the money market continues. Loans of the Cincinnati banks have been expanded over \$1,500,000 during the first quarter of 1895, while deposits have increased only about \$500,000, and now country banks are drawing upon their balances quite heavily, and in addition are borrowing funds, indicating activity in the rural districts.

THE SYRACUSE STOVE WORKS, Syracuse, N. Y., have in the Kernan Welcome range a very attractive six-hole stove, which embodies the results of years of experience both as regards ornamentation and constructive features. The range has large fire box so arranged that the grate pulls out through the front opening without disturbing the water back or brick, capacious oven and Duplex Dockash or plain flat grates, as may be

desired. The sheet flue is of good size and the stove is guaranteed a quick baker and worker. The hot air for the upper rooms is drawn from the base and rear of the range without interfering with the water back or baking qualities. The Kernan Welcome is offered in two sizes, portable form and brick set.

Settlement of the Trouble at the Southern Stove Works.

The differences existing for some time past between the workmen and the management of the Southern Stove Works, at Evansville, Ind., have been adjusted and it is expected that matters will now run along to the satisfaction of all concerned. A brief account of the trouble and the settlement is contained in the issue for March 10 of the *Evansville Courier*, being an interview with August Brentano of the firm of Kiechle, Brentano & Oberdorfer, proprietors of the Southern Stove Works. In this interview Mr. Brentano says:

The firm closed their works in December, as they usually do for some time during that season. Early in January many of the employees went to Mr. Brentano and desired him to commence work again. He then called together 30 of his most skilled workmen and said: "Now, you can all go to work if you will not interfere with other men who make all kinds of stoves." They agreed not to and we commenced operation again. After we had been working for about two weeks we received an order for a Franklin stove from New Mexico. Several pieces were missing and the foreman gave orders to have them made. As soon as the workmen commenced work on them the 30 men stepped up to him and told him he must desist. There's where the difference originated. In the first place, there was no walk out; there was no lock out; there was no strike. All but 11 of the molders that were working for us were discharged by the foreman of the molding department, through the firm, for not obeying orders in regard to the discharge of some work they were told to do.

It appears that there is a certain make of stove called the Franklin that is termed a "strike" job when union men are forced to work on it. On Saturday, when the men were asked to commence work on that make of stove, there was wrangling at once. Some said they would quit that night—in fact, all but 25 said they positively refused to obey the orders of the foreman. On the following Monday all of the men reported at the molding room for duty. The question was again asked them if they would work on the stove and all but 11 refused. The foreman at once told those who would not follow instructions to take their tools and leave the premises at once, which they did.

My next action was then to advertise for non-union molders. They soon came from all over the country. The union men living here captured them, however, on their arrival, and after intimidating them paid their way out of

town again. I finally had quite a large number of molders together, however.

In the mean time the union men were continually harassing the 11 union men in our employ and their families also. They even went so far as to "do them up" and scared their families. The men were true to me as long as they could be, and then for fear of their welfare and their wives and children they went out also. I desire to say right here that those men are still in possession of their union cards and will go to work for me on Monday morning.

I finally had nothing but non union men. This continued so until Monday of this week.

On Monday G. F. Valentine of San Francisco, Cal., vice-president of the International Molders' Union of North America, came to me and introduced himself and related to me his official position, and asked for an interview. It was granted.

At the interview he asked me if the matter could not be arbitrated. I told him the firm were tired of the unfairness shown them by the local union; that this trouble had been continuous for the past seven years. We have adhered to the local union as close or closer than any manufacturer here, and we have had the most trouble and we are tired of it—thoroughly disgusted with being dictated to by our employees. However, I found Mr. Valentine a courteous gentleman, and it was not as difficult as I at first supposed it would be to adjust our differences.

The matter is now settled to the firm's satisfaction in every detail. You may say in your valuable paper that the firm are in far better condition in regard to our rights and privileges in our works than we were before the strike occurred. We now know what we are doing. Heretofore our employees run our business, and hereafter we will run it ourselves and to suit our own fancy and in accordance with the new management.

You might add that we will have nothing to do whatever with the local union. Our contract is made solely and directly with the International Molders' Union of North America.

You can say in your paper that the firm's boarding house at the manufactory was closed Friday night, and that the union men have paid all the non-union men's transportation out of the city or taken them into the union.

The union force will work for us, commencing Monday morning. I engaged 50 molders to-day, including the 11 who stood by me in time of need. There is no reason why these men should not continue their work, as Mr. Valentine admitted to me that the men, our employees, alone were in the wrong.

We have gained a decided victory, and our firm are thoroughly satisfied with the present arrangements.

STOVE MANUFACTURERS who have pattern making departments of their own will probably be interested in a new rotary wood trimmer which the Hess Trimmer Company, Twenty-fifth and Callowhill streets, Philadelphia, are

putting on the market. It is said to trim very wide work, accommodate material as thin as $\frac{1}{16}$ inch, and to possess numerous other advantages. The company have published a circular explaining the machine in detail.

S. M. Howes.

The New England stove trade recently lost a valued member in the death of S. M. Howes, which occurred Sunday, March 10, after a lingering illness, at Rockland, Mass. Mr. Howes was a native of Dennis, and while a young man went to Methuen, where he learned the tinsmith trade. In 1872 he established himself in the stove and tinware business in Rockland, where he continued for seven years. He then engaged in business in the city of Boston, and for a period of 15 years was at the head of the S. M. Howes Company, well known to the trade of the country, and especially throughout the New England States, as wholesale dealers in stoves and heating apparatus. A fully attended meeting of the Wholesale Stove Dealers' Association of Boston was held on the afternoon of Monday, March 11, at the office of the Walker & Pratt Mfg. Company, Boston, to take action upon the death of Mr. Howes. A Committee on Memorial Resolutions was appointed, as well as a committee to attend the funeral at Rockland on the afternoon of Tuesday, March 12. Mr. Howes was born 44 years ago. A widow and three children survive him. The funeral services were conducted by Rev. A. L. Wadsworth of the Baptist Church, music being rendered by a quartette. The remains were taken to Abington, where they were interred in the Mount Vernon Cemetery. Among those in attendance at the funeral were the directors of the Rockland National Bank, trustees of the Rockland Savings Bank and the committee from the Wholesale Stove Dealers' Association of Boston. Out of respect to the memory of Mr. Howes all the stove and hardware stores on Union street, Boston, were closed between two and three o'clock on the afternoon of the funeral.

The Manufacture of Furnaces in Syracuse.

We have received from E. C. Moses, assistant secretary of the J. F. Pease Furnace Company, Syracuse, N. Y., a letter in which he makes reference to the article printed in a recent issue of *The Metal Worker* respecting the manufacture and sale of furnaces in this State. Mr. Moses' letter, which explains itself, we present in full below:

Our attention has been called to the statement made on page 49 of *The Metal Worker* of March 9 in an article written by William H. Landers of this city, on "The Manufacture and Sale of Warm Air Furnaces in New York State." The statements refer to a comparison of the production of warm air furnaces in the several cities of the State of New York. Syracuse is set down as producing 2500 in an average year; Utica 8000, &c. As the estimate is preceded by the statement in which the writer says that it is made merely from observation, we do not suppose the comparison should be taken seriously by those who understand and know the relative production of the two cities. However, to correct an impression which may have been gained from the article and to set Mr. Landers right, we would state that

Syracuse produced in 1890, or in any subsequent year, far more than 2500 furnaces; in fact, the J. F. Pease Furnace Company alone have produced far more than that number. We think it would not be overestimating this city's production to state that fully 5000 furnaces are easily manufactured annually. There are, we believe, six or seven wide-awake manufacturers in Utica, and it is quite probable that they produce together from 5000 to 8000 furnaces. There are only three manufacturing concerns of this character in Syracuse. These three concerns are by no means insignificant in the production of furnaces. If the statement referred to heating apparatus in general we would, with the help of our house heating boiler manufacturers of this city, roll up some figures which would be interesting if not preponderating.

Cupola Tuyeres.*—VI.

BY DR. EDWARD KIRK.

Number of Tuyeres.

A cupola may be supplied with blast from one tuyere placed on one side of the cupola, but the objection to one tuyere arranged in this way is that the heat is driven by the blast against the opposite side of the cupola, and the destruction of lining at this point is very great. For this reason, at least two tuyeres are always placed in a cupola, and they are located on opposite sides so that the blast will meet in the center and be diffused through the stock. When a greater number of tuyeres than two are placed in a cupola they are located opposite each other and at equal distances apart to admit an equal amount of blast on all sides and prevent an uneven destruction of lining from the heat being forced unevenly against it by the blast. Any number of tuyeres desired may be placed in a cupola, and as high as 100 have been used in a 40-inch cupola and a greater number in larger cupolas. But these large numbers have given no better results in melting than two or four tuyeres in the same cupolas. It is not necessary to place a large number of small tuyeres in a cupola to distribute the blast evenly to the bed, and it is not advisable to put in small tuyeres, which are easily clogged by the fuel, cinder and iron, and are oftener rendered useless than large ones. Better results are obtained from large tuyeres and fewer of them.

The largest cupola in use may be supplied with blast by two tuyeres if they are big enough. The large cupola of the Buffalo School Furniture Company, Buffalo, N. Y., is supplied with blast by two tuyeres 12 x 18 inches, placed on opposite sides. This cupola, which is 60 inches in diameter inside, does excellent melting with only these two tuyeres, and the destruction of lining in melting is very light. I saw a large cupola with two tuyeres of about the above dimensions in use in a stove foundry in St. Louis, Mo., about 20 years ago, and it did excellent melting. The results obtained from these two cupolas would go to show that there is nothing gained in distributing the blast to the bed evenly by a large number of small tuyeres. When a number of tuyeres are placed in one row every other tuyere is sometimes placed about the width of the tuyeres higher than the tuyeres on either side of it. I have, however, never observed that anything was gained in melting by placing tuyeres in this way. When a

double row of tuyeres is used the upper row should be made very small in comparison with the lower row, for if they are made of the same size as the lower row, or even half the size, and the two rows are placed at any great distance apart the heat is so concentrated upon the lining between them that it may be burned out to the casing in one or two heats. Foundrymen using the double tuyeres, who find the destruction of lining very great, may prevent it to some extent by reducing the size of the upper tuyeres.

Shape of Tuyeres.

The shape of a tuyere has nothing to do with the melting, except as it may tend to prevent bridging or increase the depth of the melting zone by supplying blast to the fuel at different heights in a cupola. A small horizontal slot tuyere extending around a cupola, or the greater part of the way around it, tends to promote bridging, and it is generally conceded that a cupola with a tuyere of this kind cannot be run for a greater length of time than two hours without bridging and clogging up. Vertical slot and reducing tuyeres supply blast to the bed at different levels and increase the depth of the melting zone the same as the double tuyere. For this purpose the Truesdale, Lawrence or triangular tuyere, with elongated sides, are excellent tuyeres when made of a proper size and placed a proper distance apart. When it is not desired to admit the blast to the bed at different levels the flat or oval tuyeres are generally considered the best shapes, for they admit the blast freely, and a less amount of fuel is required for a bed with these shapes than with a round or square tuyere of the same area.

Tuyeres to Improve the Quality of Iron.

All kinds of fancy shaped tuyeres have been placed in cupolas to improve or change the quality of iron in melting; they have been placed to point up, point down, point across each other at certain angles and to point to the center of the cupola. There is nothing more absurd than to attempt to improve the quality of iron in a cupola by the shape or angle of the tuyeres. The instant the blast leaves the mouth of a tuyere it strikes the fuel in front of it. The shape or angle given to it by the tuyere is then instantly changed, and it passes through the crevices in the fuel until its oxygen enters into combination with the carbon of the fuel and produces combustion; it then escapes at the top of the melting zone, where it comes in contact with the iron as carbonic acid gas. This is the result, no matter what the shape or angle of the tuyeres, if a proper amount of blast is supplied. It may be claimed that the blast acts upon the iron as it drops through the fuel in the bed after being melted, but as before stated, the shape or angle given to the blast by the tuyeres is changed by the fuel, and the effect on the iron of the blast from one tuyere would be the same as from another.

Tuyere Boxes.

The tuyeres may be and are often formed in the lining of a cupola when laying the brick, but this is a very poor way of making tuyeres, for there is nothing to support the brick and maintain the shape of the tuyeres, and they are often broken or burned away until there is no regular shape to the aperture, and it is difficult to put the blast into the cupola at the point desired or to prevent iron or slag getting into the tuyere. Tuyeres are more generally

* Copyrighted, 1894, by Edward Kirk.

formed with a cast iron lining or tyeure box, having the shape and size of tyeure desired. This box may be cast with a flange on one end and be bolted to the casing, or it may be cast without a flange and placed in the lining at the desired point as it is laid up. They are made in both ways, but it is better to cast it with a flange and bolt it to the casing, making an air tight joint, as it then insures the blast going directly into the cupola at the point desired. Tyeure boxes laid in a lining answer the purpose very well when the lining is new, but when it becomes old and shaky, or a section is removed and replaced, the lining often settles and the grouting or filling falls out, leaving crevices through which the blast escapes between the casing and lining, and from there enters the cupola at points where it does no good.

The cold blast supplied to a cupola keeps the tyeure box cool and it is not necessary to cast it hollow and fill it with water to prevent it being melted or injured by the heat. The only part of the box that is exposed and liable to be injured is the end next the fire, and to protect it the box at this point is generally cast about $\frac{1}{4}$ inch shorter than the thickness of the lining and the end covered with a little clay or daubing.

Selling Gas Stoves.

The season for the dealer to buy a line of gas stoves is here and there is little doubt but that the use of this kind of summer cooking apparatus is on the increase. This fact, however, is not enough to make handling a line of them profitable. They must be displayed both conspicuously and with good taste, and the report of an official of an English company is worthy of consideration on this point. The company had previously paid little attention to display, but finally tried the experiment of a fine showroom. A very handsome department for the sale of gas stoves had been fitted up. It had been a slightly costly enterprise, but they looked upon the outlay in the light of an advertisement to a large extent. Apart from that, although the department had only been opened a very few weeks the sales had amounted to several hundred dollars. It had been shown that a wonderful difference existed between having stoves on view in good airy, handsome premises, where the consumer could go and examine them, see them lighted, and, if satisfied, figuratively take them away (in other words, agreeing to purchase before leaving); and the other style of doing business by which the customer was obliged to go to a small space, where he was shown merely a picture or representation of a stove, and if he made up his mind to have one had to wait to be supplied. When, as in the case of a fine display, he saw a stove that suited him the business transaction followed, and was completed at once.

A LETTER from one of the spokesmen of F. M. Borden & Bro., Philadelphia, states: "Our vocal instructor has trained the boys to shout quality first and then talk price." They are now showing their samples of Challenge Iceberg refrigerators, Reliable gas ranges, Electric and All Right oil cooks, and the New Process, Splendid, Novelty and Globe, Jr., gasoline stoves. Their stove repair department is now located at 122 North Second street, under the management of C. S. Stevens.

ODD PLATES.

THE MISSISSIPPI VALLEY STOVE COMPANY of Fulton, Ill., have been reorganized. It is stated that local capitalists have purchased the interests of the Ohio stockholders. The new Board of Directors consists of J. W. Broadhead, E. Lockheart, Edmund Jackson, H. T. Heller, Jacob Martin and A. L. Van Osedale. The president is J. W. Broadhead; vice-president, H. T. Heller; secretary, A. L. Van Osedale; treasurer, Edmund Jackson. The manager is A. L. Van Osedale and the superintendent is Jacob Martin.

OTTO W. ROPIQUET, who was appointed the assignee of the Rogers Stove & Foundry Company of Belleville, Ill., has filed in the County Court his bond in the sum of \$8000.

WORK has been resumed at the Shakopee Stove Foundry, Minnesota.

THE NEW YORK STOVE WORKS, Peekskill, N. Y., are making a handsome addition to their line of 45 styles and sizes of gas hot plates and special appliances. The new candidate for kitchen favor is a gas range which they call the Surprise and a sample of which is on exhibition at John Savery's Son & Co., 97 Beekman street, New York. The range has three cooking holes on the top, one having a double ring burner, the inner ring giving a small flame for simmering or slow cooking, and when reinforced by the large flame of the outer ring a very powerful burner is available. The range is of the high cabinet type with an oven 12 x 12 x 10 inches high, with a boiler below the oven and the burner arranged to do double duty. All of the burners are provided with a regulator on the air mixer for adjusting the air supply to the gas pressure. In appearance the range is attractive, the design of the castings being neat and embellished by a fine nickel panel and an art tile on the oven door.

THE STOVE DEALERS of Pennsylvania, New Jersey and Delaware are to have a fine variety of gas and gasoline stoves from which to make a selection, says a local observer. J. Elwood Yeager, Philadelphia, who runs the New Era line of stoves, has the Clark's Jewel gas and gasoline stoves. Falth & Co. have the Reliable gasoline stoves and another line of gas stoves. The Philadelphia branch of the Mt. Penn Stove Works are showing the Dangler line of gas and gasoline stoves. J. Geo. Kurtz & Bro., Mahood & Co. and Hansell & Belson also have attractive gas and gasoline goods.

THE MAJESTIC MFG. COMPANY of St. Louis, Mo., last week awarded the contract for the erection of a new factory building which is estimated to cost \$75,000. The structure will occupy a lot fronting 108 feet on the south side of Morgan street between Twentieth and Twenty-first streets. This addition to the company's plant has been made necessary by the increase in the demand for steel ranges.

THE VICTOR STOVE COMPANY, with works located at Salem, Ohio, resumed operations on Thursday, March 14.

THE AMERICAN GAS STOVE COMPANY of 615 Ogden avenue, Chicago, Ill., have issued a catalogue and price-list of the gas cooking and heating appliances which they manufacture. The goods are made under the name "American" and are offered in a variety of styles and sizes. In the ranges the bodies, ovens and broilers are constructed of heavy

cold rolled refined steel, the oven having a double bottom consisting of an extra heavy steel plate. The oven has the makers' patent automatically balanced drop door with cold handle. The broiler contains broiler pan and wire broiler grate, and there is a galvanized drip pan under the top burners. There are pilot cocks at the oven and water heater burners. The statement is made that three single and one double top cooking burners are used on all four-hole ranges, the single burner consuming 10 and the double burners 20 feet of gas per hour. The catalogue shows the American Junior, New Enterprise and Columbia hot plates or table stoves, the American china kiln and a variety of styles of gas heaters.

GAS STOVES, both for heating and for cooking, appear to be becoming more and more popular, says a London paper. According to the experience of the Gas Light & Coke Company the demand for them is increasing by leaps and bounds. In 1889 the rentals yielded a revenue of £5860; last year the income from this source had risen to no less than £18,872. Nor is this London's testimony only. From Norwich and Ipswich come reports that the adoption of these modern substitutes for kitcheners and grates has already materially affected the carriage of coal in that part of the country.

THE MARION STOVE COMPANY, Marion, Ohio, have brought out a new heater for 1895 named the Retort Oak. It is built upon the same principle as the company's well-known Retort stove, which has proved by years of success that it is possible to burn soft coal and at the same time secure a steady fire, freedom from smoke or soot and safety from gas. This is done by fitting the stove with a magazine of peculiar construction so that the fire is properly fed. The Retort Oak is of handsome appearance, having an ornamental nickel foot rail completely encircling the stove, an ornamental base, full mica illumination around the fire chamber, an artistic name plate over the central door and a well finished awing top with a graceful urn. This stove is made in two sizes, 16 and 18 inch.

AN ACTION to foreclose the trust deed on the Superior Stove Company's property, at Superior, Wis., has been filed by the Keystone National Bank, trustee. This is expected to lead to a speedy reorganization, after which the plant may be started again.

WE ARE INDEBTED to the Eclipse Stove Company, formerly the Van Wie Gas Stove Company of Rockford, Ill., for a copy of a 40-page catalogue of gas stoves which they manufacture. In the announcement to the trade attention is called to the fact that the new concern own and control all rights, titles, patterns, patents, &c., of the Van Wie Gas Stove Company, and that the manufacture of all old style stoves will be discontinued. Nothing but the latest improved goods will be turned out, special attention being given to increasing the capacity of the stove and making it possible to change a three to a four and a four to a five burner; adding a water heater, high broiler, warming oven, &c., and replacing old linings without dismantling the stove. The Eclipse Gas Stove Co. state that they will also manufacture a line of cheap one, two and three burner boiling stoves and a hotel and restaurant cake baker. The goods illustrated are for the most part cabinet ranges, the engravings being accompanied by brief descriptive par-

ticulars, dimensions of the various parts, &c. In connection with the description of their water heater a sectional view is given showing the internal construction. A list of repair parts, reference to the Eclipse ventilated oven, sad iron heaters, soldering furnaces, &c., constitute other features of interest.

THE ANNUAL STATEMENT of the Michigan Stove Company's Employees' Mutual Benefit Association, covering the period from February 20, 1894, to February 19, 1895, shows receipts of \$3693.49, and disbursements of \$1529.16, leaving a cash balance of \$2164.33. The total benefits disbursed during the period named amounted to \$1424.16, and the total amount paid in benefits since the organization of the association, May 12, 1882, aggregates \$18,336.01. From this it will be seen that the association is more than self-sustaining, and the benefits paid have in many cases helped to tide over what would otherwise have proven very serious situations.

THE WORKERS IN STOVE LINES in Albany, N. Y., are rejoicing in the prospect of a more prosperous season than the city has seen for several years. During the recent depression in the iron market local manufacturers purchased a great deal of material at reduced rates, so that they are admirably situated at this time to take advantage of the constantly improving pulse of the stove trade in general. As far as Albany is concerned, the demand for heating goods has seldom been greater at this time of the year, especially in contrast with the sales of the past several years. In consequence of a hopeful view of affairs caused by the improvement of the local and general market, Rathbone, Sard & Co. have satisfactorily settled all minor differences with their employees and will set their big stove foundry in operation again on Monday next, March 25. They will at the start employ 150 men and increase that number as business warrants. A large number of Albany iron workers have been out of employment for many months, but the men are congratulating themselves that from present indications there will be work for all before the season is very far advanced.

THE FOUNDRY of the Bussey & McLeod Stove Company, Troy, N. Y., started up again Thursday, March 14, the shut down having been of several weeks' duration. A limited number of men is employed at present, but it will probably soon be increased. The foundry was all ready to resume operations on the Tuesday morning previous, but a cylinder broke on the engine and repairs necessitated a delay until Thursday, when they were completed.

AN ENGLISH WOMAN, writing from Singapore, says: "All the cooking is done in a kitchen at the back of the house. Our cook uses coke as fuel; but wood or charcoal is the general fuel in Singapore. The appliances are very simple, but the Chinese cook can serve up a dinner equal to any to be found in the best houses in England. Cooking by gas, excepting at one of the hotels, is quite unknown in Singapore, as the Chinaman is very conservative, and will only work in the way he has been accustomed to. I have my own pet gas stove, so as to occasionally amuse myself by preparing a special dish or two; but the Chinese cook is very jealous of my work, and is always rather sulky when he sees 'Mem' cooking anything. When I say that there is not a chimney on a dwelling house in Singapore, and not a fire place in any of

the rooms, it will give people at home a little idea of the unhomelike look of the town."

THE TROY OIL STOVE COMPANY, Troy, N. Y., manufactures of the Beauty oil stoves, have appointed Reeves & Smiley, Philadelphia, Pa., and C. T. Corly, Brooklyn, N. Y., agents for the sale of their goods.

THE COLLINS & BURGIE COMPANY have removed their shipping department from Chicago to Marengo, Ill. Manager Albert Moffat has transferred his headquarters to the works at Marengo, but a salesroom and sample room will still be maintained at 225 West Twelfth street, Chicago, under charge of James A. Lounsbury, secretary of the company. All shipments of either large or small lots will hereafter be made from Marengo.

THE DETROIT STOVE WORKS of Detroit, Mich., favor us with a copy of their 1895 catalogue, which they have recently issued, illustrating and describing the Detroit Jewel gas stoves. The publication is attractively printed in a blue black ink and bound in paper covers, with embossed side title in old gold and deep blue. The Detroit Jewel ranges are of rich ornamentation, substantial construction and embody the latest features of convenience and utility. They are offered in various sizes, and in connection with each illustration are given prices, code words and weights. The body of the Detroit Jewel range is of cold rolled steel, lined throughout with asbestos. The top plate is extra large and the grates are of proper height for good combustion and made to allow for expansion when heated, so they will not crack. The oven doors are balanced, the spring being covered and so arranged that when the door drops the latter is flush with the oven bottom. The face of the door is smooth steel, forming a strong and convenient shelf when opened. Some of the opening pages are devoted to Detroit Jewel burners, while others are devoted to illustrations of Detroit Jewel hot plates.

A Problem in Hydrostatics.

At a recent meeting of the Engineers' Club of Philadelphia, C. H. Ott described an ingenious solution of a problem in hydrostatics which had come under his notice at the town of Anniston, Ala., in 1882. Works there established for the purpose of water supply and fire protection for the industrial establishments consisted of a well 10 feet in diameter, driven to a water bearing stratum 80 feet below the surface of the ground, and containing a double acting single cylinder pump located about 15 feet above the bottom of the well and worked from the pump house above.

As the water required at the time these works were established was not very heavy, the supply from the well in six hours of pumping was sufficient for 12 hours of service, and the engine and pump had sufficient capacity to empty the well within 8 or 10 feet of the bottom in about 12 hours of continuous working. When it became necessary to repair or examine the pump cylinder the water was lowered by pumpage to the greatest possible extent, and then, by means of a steam jet, the well was kept drained.

As the town grew, the supply from the well became inadequate, and a new well was started about 40 feet east of the pumping well. A shaft 6 x 12 feet was driven to a depth of 120 feet, where a

flow of water was had. In order to provide storage for water, and to connect the new shaft with the pumping well, a timbered drift, 4 x 6 feet, was run to directly beneath and about 40 feet below the bottom of the pumping well. The water supply not yet being deemed sufficient, an 8-inch well, cased with pipe, was bored in the new shaft to a depth of 230 feet below the pump house floor, and a great flow of water was struck. The drill in passing through the disintegrated limestone bored a much larger hole than 8 inches in diameter, so that large quantities of water passed up outside of the casing. When the depth of 230 feet was reached the latter quantity was so great that the water level in the new shaft could not be lowered and maintained with the apparatus at hand to more than about 20 feet below the pump house floor. An 8 inch hole was then drilled from the bottom of the pumping well to the drift below. It was still found impossible with all of the pumps and jet apparatus available to lower the water level in the pumping well to more than about 25 feet below the pump house floor, thus furnishing an ample water supply.

Some months after these arrangements had been finished a failure occurred in the pump cylinder under 50 feet of water, and with no apparatus available to lower the water in the well sufficiently to make the necessary repairs. After several expedients had been tried the following contrivance was devised:

A balloon shaped bag, in dimensions about 3 feet in diameter and 6 feet long, was made of six plys of bed ticking, roughly quilted into squares. The bag was soaked in linseed oil, and a quantity of rye flour inserted and well shaken around. A 1-inch pipe terminating in a sleeve was inserted in the mouth of the bag, which was then securely wired around the pipe. Sewn to the bottom of the bag was a stout ring and to this was wired a half pig of iron by a ring bolt inserted into its end. The bag was then wrapped tightly with twine into a cylindrical shape and was lowered into the drill hole in the pumping well by means of sections of pipe until the weight struck bottom; by estimation one-half of the bag entering the drift below, the remainder being in the drill hole. The 1 inch pipe was then attached to the service main through a stop cock and a pressure gauge attached thereto, and the bag was slowly distended until a pressure of 50 pounds per square inch was reached and maintained. The upper part of the bag swelled out and accommodated itself to the irregularities of the drill hole, the lower part of the bag swelled out into a bulb shape, the whole resembling an inverted champagne bottle cork. The drainage pump and steam jet were then set to work and speedily emptied the pumping well, the bag being held in shape during the lowering of the water by an interior water pressure of about 10 pounds per square inch in excess of the exterior water pressure. The repairs to the pump having been readily made the water was exhausted from the bag and the apparatus withdrawn.

As the materials not already on hand could only have been obtained by express in about 48 hours, and as the contrivance described was easily made and did the work so quickly that the pumping engine was stopped only about ten hours, Mr. Ott considered that the treatment of this problem was a most ingenious and clever solution of what threatened to be a most serious condition of affairs for that neighborhood.

TRADE REPORT.

The Iron Market.

The advance in wages voluntarily granted to the men in the Connells-ville Coke region has been a startling surprise, and has appeared to many a revelation concerning the movements of a leading Pittsburgh interest. The other operators have fallen into line promptly. A good deal of guessing is being done as to the position in which some of the Coke operators, furnace companies and Steel producers find themselves. Have Coke producers sold largely at 90¢ up to July? Have furnace interests contracted to sell Bessemer Pig for the second quarter at the low prices recently ruling without covering their Coke requirements? These are the questions which are being eagerly asked.

It is pretty well known that nearly everybody has stocked up with Coke lately as fast as possible. It is a matter of fact that stocks of Pig Iron have increased during the past few months. These points are in favor of the surprised buyer.

The one argument on the other side is that prospective cost has gone up. In other words, more money must be asked for crude and finished products as soon as the supplies of cheap Coke are exhausted. Whether the advance will be 25¢ or 35¢ per ton is still a question.

It may as well be acknowledged that many in the trade regard the movement with suspicion. They urge that the market is being taken hold of by the wrong end, and that only an increased demand and not a forced rise in the cost can bring about a lasting improvement.

Against that it may be urged that after all it is largely a matter of sentiment; that the industry must be jerked out of the old rut; that if that is once done, no matter how, the right start has been made, with which many will give their powerful aid.

Pig Iron.—The New York market is quiet and displays a weakening tendency so far as prices are concerned. We quote \$12 @ \$12.50 for No. 1; \$11 @ \$12 for No. 2, and \$10.50 @ \$11 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.25 @ \$11 for No. 2; \$10 @ \$10.50 for No. 3; \$10.25 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.50 @ \$10.

In the Philadelphia market sellers are talking a little more money; some who sold at \$11 for No. 2 Foundry X claim to be holding firm for \$11.25, and those who sold at \$11.25 similarly ask \$11.50. No objection will be made to these prices, providing that the movement is uniform all along the line. Consumers would be glad to see an advance, the great point being not to pay more than others are paying. It is thought not unlikely that prices will stiffen up, and it is doubtful if the inside figures of last week would be accepted as readily as they were at that time. Producers feel more encouraged than they have done

for some time past. Quotations are usually given about as follows, but it is not improbable that the inside figures will be more of an exception than they have been heretofore:

Standard No. 1 Foundry X.....	\$12.00 to \$12.50
Standard No. 2 Foundry X.....	11.25 to 11.50
No. 1 Plain.....	10.75 to 11.00
No. 2 Soft.....	11.50 to 11.75
No. 2 Soft.....	10.75 to 11.00

Another week of increasing business in local Coke Iron marks the advance toward better times in the Chicago market. A decided improvement in inquiry has taken place, and consumers are buying small lots very freely, with some disposition to increase their shipments. Some expectation exists of an advance in local iron in consequence of higher prices on Connells-ville Coke, although it remains to be seen whether West Virginia Coke will also be advanced. Unless this is done it is likely that the proportion of West Virginia Coke used here will grow considerably. Southern Iron was comparatively quiet during the week. The outlook for next week's business is much better, as quite a number of good inquiries have recently developed. An item of interest to foundrymen in adjacent towns is the notice which has been given of an advance on freights to those points of 20¢ per ton from Southern localities. Prices have recently relaxed to some extent, and our quotations are revised accordingly. Quotations are as follows for cash:

Lake Superior Charcoal.....	\$12.25 to \$13.00
Local Coke Foundry, No. 1.....	12.25 to 10.50
Local Coke Foundry, No. 2.....	9.75 to 10.00
Local Coke Foundry, No. 3.....	9.50 to 9.75
Local Scotch No. 1.....	10.25 to 10.50
Ohio Strong Softeners, No. 1.....	12.50 to 13.00
Southern Silvery, No. 1.....	11.50 to 11.75
Local Coke Foundry, No. 2.....	11.25 to 11.50
Southern Coke, No. 2.....	10.00 to 10.25
Southern, No. 1 Soft.....	9.50 to 9.75
Southern, No. 1 Soft.....	10.00 to 10.25
Southern, No. 2 Soft.....	9.75 to 10.00

Careful inquiry shows that most furnaces in the Pittsburgh district whose Coke contracts expire on March 31 have very little iron sold ahead at low prices. Those who sold ahead based on 90 cent Coke will probably prefer to close down in preference to paying higher prices for Coke and making the iron at a loss. As to Pittsburgh prices, little can be said. Furnaces whose Coke contracts expire with this month are refusing to quote. Those who have cheap Coke up to July 1, are holding off to see whether higher prices will not come. In the absence of any recent sales we quote nominally as follows:

No. 1 Foundry.....	\$10.50 to \$10.65, cash
No. 2 Foundry.....	9.65 to 9.70 "

The buying movement in the Pig Iron market at Cincinnati continues quite active, but while there is an evident disposition among consumers to provide for their wants, in part at least, for the next four or five months, they are unwilling to meet any demand for higher prices and thus far the increased volume of business has not resulted in any appreciation of values. The largest buying during the past few days has been by rolling mills in the northern part of the State. There have also been several contracts of moment placed by local foundries. The sales to foundries were mainly of No. 2 Foundry. One en-

couraging feature is the number of small sales making from single cars up to 500 ton lots and the diversity of interests covered by the buying movement. Quotations are given as follows:

Southern Coke, No. 1.....	\$9.75 to \$10.00
Southern Coke, No. 2.....	9.00 to 9.25
Southern Coke, No. 3.....	8.50 to 8.75
Ohio Soft Stone Coal, No. 1.....	14.50 to 15.00
Ohio Soft Stone Coal, No. 2.....	14.00 to 14.50
Lake Superior Coke, No. 1.....	11.75 to 12.25
Lake Superior Coke, No. 2.....	10.75 to 11.50
Hanging Rock Charcoal, No. 1.....	16.00 to 16.50
Hanging Rock Charcoal, No. 2.....	15.90 to 16.40
Tennessee Charcoal, No. 1.....	13.00 to 13.50
Tennessee Charcoal, No. 2.....	12.00 to 12.50
Bessemer.....	11.65 to 12.00

Metal Market.

Pig Tin.—There has been a sharp rise in prices on both prompt and future deliveries and more or less excitement in the wholesale market at times, yet a smaller volume of business than might have been expected under the circumstances. On prompt and current month delivery the advance was about 0.70¢. May delivery moved up 0.60¢ and later futures 0.40¢ @ 0.50¢. Speculative dealings, however, did not involve much, if any, over 500 tons, despite this movement in values and remarkably heavy trading in London. Out of town jobbing purchases were merely routine in character and nothing more than the average business was done with consumers. Not a few of the latter have a good stock from deliveries made on prior purchases and requirements generally seem to have been so well covered that the speculative flurry stimulated purchases in a very moderate degree only. The rise in prices was due chiefly to comparatively light shipments from the Straits and the advance in silver. The shipments during the first half of March were 1460 tons, of which 230 tons to the United States, 900 tons to London and 230 tons to the Continent, against 1775 tons in the corresponding period last year. Quotations on small lots of Straits from store are virtually unchanged at 14½¢ @ 15¢ per lb.

Copper.—Continued pressure to sell has caused a further decline in prices and the market remains unsettled and depressed. Home consumers have taken a very fair amount of Copper through closing contracts previously pending and new purchases at the lower range of prices. Electrolytic sorts fared relatively the best. Some export purchases have been made and more or less stock has gone abroad on consignment. The entire movement, however, has little effect against the depressing influence of large supplies at the mines and continued heavy production. Exports from this port the past week include 253 tons Plates, 60 tons Ingots, 130 tons Pigs, 40 tons Bars and 290 tons Matte. In small retail business inquiry has been only moderate and prices unchanged on a basis of 10½¢ for Lake Ingot in small parcels.

Sheet Copper.—While the demand for cornice Copper is fully equal to if it does not exceed that of last year at the same time, it still lags behind the average of a good season. Inquiry is, however, rather more active and the

large amount of building in prospect in this section gives promise of much better trade later in the year. Small lots of sheet Copper from store are quoted at the net list price of 14¢ @ lb.

Pig Lead.—A decided change has taken place in the market and there are indications that the long drawn out contest between prominent consumers and producers has ended, temporarily at least. In any event it is the fact that fully 2500 tons have been taken by home consumers and that nearly or quite 1500 tons were purchased for export. Export purchases were stimulated by a rise in London prices, due to comparatively light stocks of Spanish and English Lead there, and home trade buying was helped along by that circumstance and knowledge as to the favorable statistical position on this side of the Atlantic consequent upon restricted production here during the winter months. Jobbers report a rather light demand for both Pig and manufactured Lead, with no changes in the prices for small parcels quoted last week—namely, 3½¢ for American Pig, 5½¢ for Pipe, and 6½¢ for Sheet; the two last quoted being subject to a discount of 20 %.

Spelter.—Nothing more than routine business has been effected in this market, and there is little if any change as regards demand. In short, the market here is still a very narrow one in all particulars. Enough orders go out from other quarters to keep the primary market in very fair shape, however. Prices for small lots of good Western brands from store are quoted at 3½¢ @ 4¢ @ lb.

Antimony.—Jobbing business is fair, but otherwise there is little doing. Prices for small parcels are quoted at 9½¢ @ 9½¢ for Cookson's and 8¢ for Hallett's.

Nickel.—Seller's quotations remain at 35¢ @ 40¢, as to size of lot.

Tin Plate.—Having passed the proverbially fatal "idea of March," the long and continuous period of dullness in the Tin Plate trade seems to have been broken. A better tone has developed in the market, and some quite liberal purchases have been made of ordinary Coke Plates for delivery during the spring months. There has also been more general buying of spot stock, low prices having at length served to stimulate purchases. Assistance to sellers has come also from the curtailment of production abroad, and the consequent depletion of stocks, leading to a general hardening of prices to a greater or lesser extent all along the line—that is to say, concessions on quoted rates are less readily given. No quotable change in prices has taken place, however. The weather has been against building operations, and the call for Roofing Plates has been very moderate accordingly. Small business is still behind the average, and the size of individual orders does not yet increase much beyond the limit of present requirements.

A special London cable dispatch of March 20 to *The Iron Age* reports as follows in regard to the British Tin Plate market: In the Tin Plate market there has been a change for the better. Inquiries have improved decidedly and buyers are offering 3 half-pence over last week's bids. Sellers' figures are up 3 pence from the lowest point touched. Large lines for Russia have been placed and there is improved demand from the Continent. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, 1C 14 x 20	9 11/16	@	9 3
Siemens Cokes, 1C 14 x 20	9 4 1/2	@	9 6
Ternes, 20 x 28	17 6	@	22 6
Charcoal, 1C 14 x 20	10	@	13

Sheet Iron—Both Black and Galvanized Sheets are in exceedingly good demand. Mills are well supplied with orders, and manufacturers are showing some disinclination to contract for future deliveries, particularly in view of the possibility of an advance in Billets. Values are, however, as low as ever, notwithstanding that the leading mills are refusing to book at the lowest prices prevailing. Small lots of No. 27 Common Iron are quoted at 2.60¢ @ 2.65¢ from stock and of Galvanized at 75 and 10 ¢ off.

Chicago Report.

Scrap.—Business continues fair, with a marked scarcity in Cast Scrap. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	\$6.50	...
Machinery Cast	5.50	...
Malleable Cast	5.00	...
Sheet Plate (free of burn)	4.00	...
Burnt Iron and Grate Bars	3.00	...
Sheet Iron and Hoops	2.00	...
Plow Steel and Breaking	4.00	...
Stock	3.00	...
No. 2, such as Shovels, Hoes, &c.	3.00	...
Old Boilers—whole (Iron)	3.00	...
Iron—cut in single	5.00	...
Sheds and Rings	5.00	...
Old Gas-Pipe and Boiler	5.00	...
Tubes	3.00	...
Cast Borings	4.00	...
Turnings	7.50	...
Horsehoes	6	...
Copper Bottoms	7 1/2	...
Copper Clips and Heavy	6 1/2	...
Heavy Brass	3	...
Light Brass	2 1/2	...
Pipe Lead	2 1/2	...
Tea Lead	2 1/2	...
Zinc	4	...
Rubber	4	...

Anthracite.—Trade is quiet. Winter is about over, and little will now be done for several months. Dealers here have large stocks with which to enter upon another season. Carload lots of 12 net tons or over are quoted as follows, although some concessions are now being made:

	Egg, Sto.	Grate, and Ch.
Chicago, Ill.	\$4.75	\$5.00
Milwaukee, Wis.	4.75	5.00
Kansas City, Mo.	7.95	8.20
Council Bluffs, Iowa	7.95	8.20
Lincoln, Neb.	8.10	8.35
Sioux City, Iowa	7.95	8.20
Aberdeen, S. Dak.	8.00	8.25
Dubuque, Iowa	6.05	6.30
Madison, Wis.	6.25	6.50
St. Paul, Minn.	7.25	7.50
Burlington, Iowa	6.25	6.50
Des Moines, Iowa	7.75	7.95
Davenport, Iowa	6.05	6.30
St. Joseph, Mo.	7.95	8.20
Leavenworth, Kan.	7.95	8.20
Omaha, Neb.	7.95	8.20

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	\$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo.	10.00
All points between Denver and Missouri River	8.85

A MEETING of the Canadian tinware manufacturers was held last week in Montreal, and was attended by representatives of all the leading firms. Some changes were made in the list prices of goods and a number of important lines of goods were withdrawn from the association's list and will henceforth be sold at open prices.

CONDITION OF THE

Hardware Trade.

TRADE runs along without any important modification in volume, the demand being somewhat uneven, and, to a certain extent, spasmodic. Seasonable goods are moving with a fair degree of freedom and constitute a considerable portion of the current business. It is evident that trade in general is, on the whole, better in the West than in the East, and the reports which come from many Western points are gratifying. It is the view of many well-informed persons that as soon as moderate weather prevails in the East there will be a marked quickening in the demand, and that business will assume something like its normal volume. Advances from architects and others in close touch with builders indicate that there will be an increased amount of building this year, and some are taking sanguine views of the prospect. The outlook for the market in general would be much more satisfactory if there were evidences of a decided improvement in its tone so far as prices are concerned, but these unfortunately continue without showing many signs of firmness. Some of the staples are not apparently quite as strong as a short time ago, and on many classes of Shelf Hardware and miscellaneous goods prices are somewhat ragged, furnishing sufficient reason for the manufacturers' complaint of their unprofitableness. Manufacturers are, however, learning to be more conservative than formerly, and some of them are holding aloof from the market for a while rather than force the sale of their goods by further concessions. Stocks certainly are low both in the hands of producers and the trade, and a sudden demand would in many lines cause something of a scarcity.

Advices from Chicago.—The past week showed a rapid growth in the volume of business. A leading house here is reported to have received on Monday the largest mail in any one day for three years. Orders are not only more numerous, but they are steadily growing larger. One of the strongest features of the trade to which allusion has previously been made is the continuous demand for new stocks of goods. Scarcely a day passes that a new stock is not purchased in this jobbing center. Orders of this character swell the volume of business very decidedly. The general demand for goods is still of a hand-to-mouth character, orders being sent in only when the goods are needed. This is shown by the urgent demand for prompt shipment. Tinware has been moving much more freely. The only material change in prices recently made is an advance of 5 per cent. on the new list of Carriage and Machine Bolts. Excepting the cut in Wire Nails, nothing has happened so far this year to seriously disturb the even course of the jobbing trade in this locality. No serious cut has been made in any other class of goods by jobbers in order to induce trade, as has been the case in previous seasons. The Nail situation now promises to adjust itself, and in a short time this irregularity will probably be eliminated. Heavy Hardware is picking up, particularly with agricultural implement makers.

The End of a Strike.

The building trades strike in New York City has ended under an agreement which is virtually a defeat for the workmen. The union electrical workers, who claimed an eight-hour working day, have had this conceded to them from May 1, instead of May 15, a matter which might probably have been arranged at first by reasonable methods. This is the full extent of their gain. Beyond this, the union has been obliged to agree that its members who went back to work before the strike was off shall suffer no penalty, and that the non-union men who took the places of the strikers shall not lose them. Thousands of other workmen in other branches of the building trades who, generally against their own inclinations but in obedience to the orders of their autocratic rulers, the Board of Walking Delegates, struck in sympathy, get nothing at all. In other words, numbers of the strikers have not only lost a month's wages, but find themselves left without employment. Thus once more has a strike entered into without sufficient justification signally failed of its purpose. What have been the consequences? Serious pecuniary loss has been suffered by both parties to the dispute; great inconvenience has been imposed upon a large portion of the community by the stoppage of building operations for a month; ill-will has been engendered between employers and employed; and, at the end, a number of intelligent and industrious workers have lost their positions and find themselves and their families reduced to destitution. All this is not offset by any corresponding good, either monetary or moral.

Why It Failed.

This is merely a repetition of the lesson which has been read over and over

again within the last few years—a lesson, however, which seems hard of apprehension by labor organizations. The lesson is that a strike to be successful must be scrupulously justifiable. This one failed because it was wrong. The electrical workers had agreed to a ninety days' notice of any demand for a change in the terms of their labor, and they overrode this contract. As to the other workmen, even granting that the electrical workers had a grievance, they had none, and their so-called sympathetic strike was as entirely unwarranted an action as was the Debs railroad strike to coerce the Pullman Company last year. Strikes of all kinds are becoming so frequent, and are undertaken nowadays on such flimsy pretexts, that the public has but little sympathy left to bestow on the strikers, even at the best of times, and none at all in the case of unjustifiable strikes, such as was this one. Public sympathy, in the case of sympathetic strikes, is exclusively with those who are dependent on the misguided men and who suffer from their actions; not at all with the men themselves. This is particularly the case when workmen permit themselves to be led into wrong and foolish actions by submitting their independence to a board of walking delegates, a class which thrives on labor disturbances such as these. One gratifying feature of the late building trades strike should, however, be recorded. It was unaccompanied by a single act of lawlessness or riot. In this respect it will compare favorably with many recent troubles of the kind.

Some Signs of Improvement.

To the country at large it must be an unspesakable relief to note the signs of improvement which are multiplying on the business horizon. The developments of the past two weeks have been almost uniformly in the direction of encouragement. They point to a revival of confidence, that all-important factor without which no return of prosperity can be secured. Trade and industrial reports are more favorable. Railway traffic returns, which made so poor a showing in the blizzard month of February, exhibit so far for the current month a distinct improvement. The bank clearings last week showed a material increase as compared with last year's figures, indicating a growth in the volume of general business. Wall Street has taken the lead in the upward movement, stocks and bonds having experienced accession of strength and activity. Prices of securities are advancing steadily and uniformly. The investing public is again largely in evidence as buyers on "the street,"

having apparently reached the conclusion that affairs, both financial and commercial, have, since the departure of Congress, entered upon a safer stage and one from which the disturbing influences which have affected the markets for the past two years have been removed. The money market is hardening, and foreign exchanges are easier than for some time past. Silver is rising in value, and the markets for grain and cotton have advanced in a manner which would have been thought most improbable a short time ago. Recent heavy foreign buying of our railway securities indicates the beginning of a movement to repurchase at least a portion of the immense volume of stocks and bonds sent back to this country from Europe since the Baring panic. A large increase in the importations of merchandise reflects the belief on the part of merchants that there will be a brisk spring trade. In short, all signs point to the beginning of a recovery which, if, somewhat gradual, promises to be continuous. It is true that the gain in general business is slow as yet and its volume materially below that of a year of average prosperity; but it is growing, and gives promise of considerable expansion in the coming months.

Church Heating Plants.

It is probable that the weather of the past winter made more extensive repairs necessary in church heating systems than in any others, and whether the systems were steam, hot water or combination, the effect was the same. The most severe effect of the weather coming at the middle of the week, many church heating plants were without fire, no fire having been necessary during the previous portion of the season to prevent their freezing. On firing up late in the week for the next Sunday the damage sustained was discovered in many cases too late to be repaired in time for use on the following Sunday. In some hot water jobs every radiator in connection with the plant was frozen and burst, and in some cases every section of the radiator. The damage was not confined to the radiators alone, but both the flow and return pipes and the fittings succumbed to the frost. In steam plants where the condensation did not return to the boiler owing to poor piping or want of air valves, the plants were rendered unfit for service by ice bursting pipes and radiators. In churches where combination apparatus was used some difficulty was encountered in explaining that the water heating apparatus would be ruined if the furnace was run, though in some cases the risk of its destruction was taken in order to have service. It requires more judgment than is possessed by the average sexton to say when the fire shall be run to prevent freezing, and the extra labor of emptying and filling the system as a precaution is seldom undertaken.

THE LETTER BOX.

Are Gravel Roofs Durable?

From G. F. WHELOCK, Birmingham, Ala.—The correspondence started by "G. D. B." in *The Metal Worker* February 16 in reference to tin and gravel roofing has opened up a very interesting question, and to me personally it resulted in a very pleasant correspondence with "G. D. B." of Greenville, S. C. I have had a couple of communications from him, and from his statements of conditions and results I give him credit for being perfectly honest in his assertion that he can put on a good tin roof for \$4 per square and make money. But while those conditions exist there I have never met them in any other part of the country during my travels, which cover the Eastern and Western States and this portion of the South. In regard to the relative cost of tin and gravel roofing, I would base the price of a good tin roof laid on sheathing paper and finished with two coats of good paint at \$7.50 per square, with a resultant profit to the roofer of \$1 per square. Admitting that this roof with slight repairs and a coat of paint every two years at a cost of 75 cents per square will last 20 years, we have a total cost during its life of \$15 per square. Now, we must bear in mind that to attain this result the roof must be looked after every couple of years. If this is neglected and the roof is allowed to rust, it will, of course, proportionally shorten its life.

Now, as to the gravel roof, I will base my price at \$4 per square for a four-ply coal tar pitch composition roof; this will give the roofer \$1 per square profit. This roof will last at least for ten years, when it can be replaced at the same original cost, making the total cost for 20 years \$8 per square and requiring no attention during the life of the roof. To attain this result the material and work must be of the best; and in this connection I wish to say that there has been a great improvement in the manner of doing gravel roofing in the past few years, especially the substitution of metal for the old style felt flashings and metal eavestrips for the wood strip. Right here, in my mind, is the vital point, in connection with composition roofing. Any portion of the roof where it is not possible to protect the felt, on account of the position or shape, with gravel should be covered with metal, for as long as the felt is perfectly protected the roof will last.

In the laying of a good composition roof a good grade of tarred felt, weighing not less than 2½ ounces to the foot, should be used. Care should be taken that there is not less than four thicknesses at any part of the roof, well stuck together with hot pitch. In finishing the top surface with gravel, which should be not larger than ½ inch and free from sand, the pitch should be poured and not applied with a mop. To put on a roof in this manner will require about 100 pounds of pitch to the square. While I base the probable life of this roof at ten years, if asphalt properly prepared is substituted for pitch and the felts are saturated with asphalt instead of coal tar, I will place

the life of the roof at 25 years, and I believe this a safe limit.

I apply a roof of this kind here, for which I charge \$7.50 per square, same as first cost of a good tin roof, painted, and as between the two there is no comparison. To show the value placed upon this roof by one of my customers, who has used the same roof on his buildings in St. Paul, Minn., he says he would rather have it at same cost than sheet gold. While I hardly agree with him on this point, I do believe that asphalt, when properly prepared and applied, is the best roofing material for flat roofs in the market, copper not excepted. Coal tar pitch in time by exposure loses its oils, becomes brittle, the gravel is loosened, the felt is exposed and rots. Asphalt is not affected by exposure to the atmosphere, does not become brittle, and consequently holds the gravel securely in place. I notice that some roofers are in the habit of using pine tar pitch. This becomes very soft in summer and very brittle in cold weather, and I do not believe it possible to do good work with it.

Mending a Boiler.

From H. J., Camden, N. J.—About four o'clock in the morning of the day before Christmas I was called to the

Mending a Boiler.

house of one of my clients whose kitchen was nicely flooded with water. I immediately turned off the water in the cellar and found a hole in the top of the boiler from which water had been spurting until it had washed the paper off the ceiling for a space 3 feet square. The head of the boiler was of wrought iron, stamped up into a dome shape. I reached out the hole almost large enough to receive a ¼ inch tap. Then with a tapering punch or drift pin, which I drove into the hole, I enlarged it sufficiently to receive the tap, at the same time forcing in the metal and increasing the surface which would bear on the tap in cutting the thread. After threading the hole I inserted a plug and stopped the trouble. The sketch I send shows the way it was done. I found two other small rusted spots on the top of the boiler which I have told the owner will eventually become leaks. This is not my first experience with holes of this character in a galvanized iron boiler. I have put eight plugs in a boiler in the house of one of my customers, and have found that a galvanized iron boiler will frequently show a tendency to rust out in spots in from

four to six years. Sometimes they last longer—to 12 or 16 years—but in my experience I would consider a galvanized boiler that had been in use 20 or 25 years without developing any of these rust spots, which eventually become holes, as one of extraordinary durability. I thought that this experience and method of mending a boiler might be of interest to some of your readers and have sent it in.

Lining Tanks With Lead.

From S. K., Grand Rapids, Wis.—I would like to get from *The Metal Worker* or some of its readers some information about lining tanks with sheet lead. Is it necessary to tin the edges of the lead when round irons are used, and how is the solder put on?

Note.—In lining tanks with sheet lead where round irons are used the seams are generally wiped. In preparing the lead it should be laid out on a clean, smooth floor. A piece of lead about 3 inches wide and 10 inches long, one end curled in a circle for a handle, is used to pat the lead smoothly all over. After this is accomplished the lead is cut in sizes that will make the least number of seams in the tank, and if possible these seams will be brought into the corners in all cases. The edges of the lead from ¼ to 1 inch each side of the seam should be cleaned bright with the shave hook. The lead beyond this cleaned line may then be covered with soil to prevent the solder extending beyond the seam, or if strips of paper are pasted along, using good flour paste, the same service will be rendered. The lead lining after being prepared is placed in the tank and the method of securing it depends upon its size. In some cases, as with a small tank, it will only be necessary to turn the edge of the lead over the edge of the tank and secure it with nails. If the tank is large it will be necessary to fasten the lead at regular points in the tank by means of what is known in the trade as a bull's-eye. The bull's eye requires a concave surface to be made in the wooden portion of the tank about ½ inch deep and 2½ or 3 inches in diameter. After the lining is in the tank it is beaten smooth into these hollow spaces with a piece of sheet lead and fastened with a screw or nail. Then its inner surface is scraped clean and bright with a shave hook, and the space around it either covered with soil or paper pasted on to prevent the solder splashed against the bright surface in tinning it from adhering beyond its space; then, with a wiping pad, the space is wiped flush with solder. This makes a very firm support to the whole lining. The

lining having now been adjusted in the tank and secured by nails at intervals of 4 to 6 inches along the seams, the wiping of the seams can be commenced. With a large pot of solder at the right temperature it should be splashed along the seams and wiped with the pad until the bright places are thoroughly tinned and a sufficient quantity of solder placed along the seam to permit of a good strong seam being wiped. Here is where the round iron is brought into use. As the solder has been splashed on the seam with a splash stick and ladle, the pad should be used to keep the solder in a heap in the center, and naturally it would cool to an extent that it could not be wiped, as a space of 2 or 3 more feet, according to the skill of the operator, will have been prepared. The seam, however, being well heated and the solder almost in a condition for wiping, the red hot round iron is moved along the seam until the whole mass is again in a fluid state; and while in this condition a clean pad, to which some tallow has been applied, is used to finish the seam. On horizontal seams little difficulty will be experienced, but in the upright seams more trouble will be found. But if the workman is skillful, there is no great difficulty in completing a neat, strong seam, with the metal at a sufficient heat to fuse thoroughly and not to be porous so as to leak.

Collapsed With a Vacuum Valve.

From S. J. L., *Catasauqua, Pa.*—My opinion as to the cause of the coffee boiler, referred to by "M. A. C.," Petoskey, Mich., March 16, collapsing, is that the vacuum valve should be on the hot water pipe and not on the cold pipe (or supply), as the hole in the delivery pipe is usually small and is liable to be closed by sediment. I have had considerable experience with copper boilers, and have found that the hot water pipe is the place for the vacuum valve, the reason for which is clear.

Inside Cold Air Duct.

From B. REESE, *Odessa*.—I notice the inquiry from "Spec. Spencer" in *The Metal Worker* of March 16, and having had no experience with inside cold air ducts would ask some of the Northwestern furnacemen to supply the information. I know that in Nebraska and Dakota the use of an inside cold air duct is quite common and necessary, as the outside air is frequently driven along at the rate of over 30 miles an hour and at a temperature of as much as 35 to 40° below zero, and under such circumstances it is quite probable that it would pass through the furnace without being properly heated, and as a consequence the building would not be comfortably warmed. Whether or not some cold air is taken from the outside when the inside duct is used is a question I should like to have answered. It is stated by some authorities that an ordinary window leaks 8 cubic feet of air per minute, and if only inside air was used leaks to this extent would provide ventilation, but in that section of country double sash are used for the pur-

pose of preventing leakage of air and also of the too rapid cooling of the air in the room by the excessively cold temperature of the air on the glass, so that little ventilation could be depended upon under such circumstances from the windows. I should not desire to live in a house where the furnace had no other source of air supply than from the house itself, for while a revolution of the air in the house tends to economy in heating it provides no ventilation, which I consider of great importance.

An Engineer's Education Wanted.

From J. S., *Omaha, Neb.*—Please give in *The Metal Worker* a method and scale for finding how much radiation will be required to heat a room, for example, 50 x 22 x 13. What would be the best way to set the radiators? Please give a scale stating how many square feet of radiation is exposed in 1 foot of wrought iron pipe from $\frac{1}{4}$ inch to 2 inches. Give the tables for radiation for both steam and hot water heating. What per cent. of increase in heating surface is allowed in frame buildings over brick or stone buildings? Is there any difference in the allowance made for walls, doors and windows?

Answer.—The secret of successful heating may be truly said to lie in calculating the amount of heating surface required for different buildings, and the information desired by our correspondent covers too much to be treated in a limited space. He will find a chart for calculating areas and cubic contents that will be of some service to him in *The Metal Worker* of December 8, and an article that tersely covers the subject in which he is interested will be found under the head of Hot Water Heating in *The Metal Worker* of March 2. To get the best rule on the subject about which he makes inquiry he should read some of the books that are published in reference to it. Among those that we recommend are "The Metal Worker Essays on House Heating," "Steam Heating for Buildings," by William J. Baldwin, and "Hot Water Heating and Flitting," by the same author.

The room mentioned contains 14,300 cubic feet, and in hot water heating it might be safe to calculate on one square foot of surface heating to 30 cubic feet of space; therefore 480 square feet of radiation would be required. In steam heating one square foot of surface might be used to heat 50 cubic feet of space, and 285 square feet of radiation would be needed. In hot water heating for houses or smaller rooms one square foot to 25 or 30 cubic feet of space, according to the character and exposure of the building, is used; and in steam heating work one foot to 40 or 50 cubic feet of space is generally used. One square foot of glass surface, as it is exposed in the window, is supposed to have the same cooling effect as 10 feet of ordinary wall surface. To be able to use the rules they should be read in full and studied at some length, and then applied with

considerable judgment to secure the best results. The surface exposed in different sizes of pipe is given in almost all price-lists of pipe and in the books recommended. Radiators should be set in front of a window in preference to any other location in a room.

A Detail of Construction.

From A. S. R., *Saratoga Springs, N. Y.*—Would you kindly inform us through *The Metal Worker* if expanded steel flue in a cast iron house heating boiler head are more likely to leak from unequal expansion than when in a steel head? Is an all steel boiler shorter lived than an all cast iron one? We claimed that an expanded flue is the most sensible of any system of flue connection, as all high pressure boilers and locomotive boilers are put together in that way. We would like to hear the opinions of the experts on this matter.

Note.—The form of connection in most general use is of the expanded flue character; and we should prefer to have our practical readers report as to which of the two flue connections mentioned is more desirable. The durability of boilers is a question on which opinions differ, the popular opinion being that as a house heating boiler is not in use in summer a wrought iron boiler suffers more than the cast iron boiler under the same conditions. Wrought iron boilers have been in use for power purposes for more than a quarter of a century; and an all cast iron house heating boiler that was installed in a residence in 1859, doing constant service until 1894, is now doing service as a radiator in the salesroom of a heating contractor, and is apparently in good order.

Quality of Tin Roofs.

From G. L. P., *Kentucky*.—The boss takes *The Metal Worker* and I find it both interesting and instructive. The views of your correspondent in the issue of March 9 on the quality of tin roofs struck the nail square on the head, and to make his article complete I would add that the tin plate factories now in operation and in contemplation in this country are doing more to kill the goose than all other agencies combined. In the first place, by seeking cheap metal and cheap methods of manufacturing tin plate, nine-tenths of them are turning out a miserable quality of plate, and in a few years, at the pace they are now going, their occupation will be like O'hell-o's, for the simple reason that consumers will have to look for some other material for roof covering than tin orterne plate, so that in a short time it will only be a question of the survival of the fittest. When I look out of the back window of my shop I can see within a few feet of me a tin roof that I put on 25 years ago that is as sound to day as the day it was put on, and a very flat roof at that, and when I look out in another direction I see another roof that I put on but a few years ago that is leaking on account of rusting out, then I am forced to the conclusion I have expressed. I have been using American plate for the past two years and find it uniformly poor in quality, although I bought the highest priced goods in the market. The thing in a nutshell is that our tin

plate manufacturers are killing their products with acids and making use of black plates unfit to be coated.

Sheet Metal Launch.

From LOUIS GIGLAS, Washington, D. C.—As the inquiries continue to come on concerning the sheet metal launch, a description of which appeared in *The Metal Worker* of November 10, I wish for the benefit of the readers of *The Metal Worker* as well as myself you would publish the statement that I will not furnish any more drawings and specifications for the launch. All information concerning the motors can be obtained by addressing the Sintz Gas Engine Company, Grand Rapids, Mich.

Is Trap Ventilation Necessary?

From A. B. K., Burlington, Vt.—There has been some discussion here relative to the ventilation or back airing of traps. I claim that there is no advantage in the practice except to prevent siphonage; and where there is no danger of the trap being siphoned by the use of some other fixture or other means, it is better not to run any back air pipe to make the drainage system complicated. This is an old question, but is one that is not fully settled here; and I would like the testimony of the best authorities on this point.

Note.—English writers on this subject all agree that every trap should be ventilated. This subject has been treated in the works of W. P. Buchan, P. J. Davies and S. S. Helyer. The Board of Health of New York City in preparing the plumbing code of the city decided that such pipes were necessary. The opinion of these authorities, however, is not accepted by some eminent plumbers, who entertain ideas similar to those of our correspondent. We should be glad to have this subject discussed.

Trouble with Furnacemen.

From SANITARY, Connecticut.—I have read the letter of "Tinsmith" in *The Metal Worker*, March 23, and considering his job from a humane standpoint, I see nothing to be proud of. Commercially he is to be congratulated on having heated the house; but can it be considered to be a sanitary job? The old proverb for health is to keep the head cool and the feet warm and, if I mistake not, he has reversed the conditions. How can the floor of a house be warm if the cellar is used as a cold air chamber? What kind of a place is a cellar to live in? Is the air that comes from a cellar any better because it has been superheated? Would it be possible to get a temperature of 94°, 8 feet from a register, if it was not superheated? Will not the air to warm a given room have to be very much hotter if the pipes are small, as he recommends? His recommendation on comparing with the job shown March 2 amounts to reducing the pipes 1 inch in diameter. A 7 inch pipe compares with an 8-inch pipe as 49 compares with 64, a reduction of one fourth, to be made up by increased temperature and velocity, both of which are wrong from a sanitary standpoint. Increased temperature means more frequent action of the lungs to get the required oxygen.

Increased temperature means a dryness of atmosphere that parches the skin and membranes to irritation, coughs and inflammation. Increased velocity means drafts on the body to effect evaporation of moisture, causing a tax on the system that is paid by indigestions. How much ventilation could be ventured upon with so little inflow of air? How many changes of air per hour could be had with such small pipes? The furnace mentioned is small and would have to be run hard, to its detriment and to the delight of the coal dealer. The recommendations made are in a commendable spirit to help a brother and many may differ with me, but I think they reflect more of cheapness than of progression. The furnacemen are sneered at by other heating men and it is largely their own fault. They have followed a rut and let price govern their practice till, taken as a whole, there is less in it to be proud of than there should be. Instead of following the suggestions given the trade should advance. The underlying principles should be studied and aggressively pushed. How many furnacemen really say what the heating arrangement should be? They are so few that they are lost to sight. The veriest hatchet and saw carpenter dominates over the furnaceman and tells him: "What I say or nothing." No matter how little he knows, what he says goes. Owing to the character of furnace work, as a whole, other methods of heating that are far more expensive and not to be compared with an ideal job of furnace work are supplanting furnaces, though in effect they have little but novelty to recommend them. Furnacemen, wake up! Let us educate our less competent brothers to a higher standard and maintain it.

Boiler Siphons.

From W. C., Paterson, N. J.—Will some reader of *The Metal Worker* explain why water is siphoned out of a boiler which is used for heating purposes?

Note.—If more information as to detail was given in this inquiry, it is probable that a more satisfactory answer could be furnished. We assume that a boiler has been set in a room above the kitchen in order to heat the room, and that but very low water pressure is found in the system at some portion of the day. Then by opening the faucets below the boiler the water is siphoned out. It is possible that the delivery tube in the boiler has no hole in it at the top, or that the hole is stopped by sediment which causes the trouble.

A Peculiar Furnace Experience.

From C. S., Cleveland, Ohio.—Answering article of E. E. Palmer, Harrisburg. "A Peculiar Furnace Experience." In *The Metal Worker* of March 16, will say that he points out the cause of our trouble at fire place flue. We anticipated the trouble there ourselves, stopped it up and made a trial with no better results. In regard to the cause of objectionable drafts at present in the rooms that we endeavored to obviate, we know that a good portion is due to large glass surface in bay window. The room is never closed off; sliding doors are left open at all times. We also note

what Mr. Palmer says about too much ventilation in fire place and not being able to warm certain rooms; we have had cases where we could not warm certain rooms until we opened fire place flue. The sketch shows the cold air register placed at the northwest end of room, and if leaks do occur at windows it seems to us the leakage should act as a damper at least on the cold air register, and not allow hot air to rise from it. This is quite a puzzling and peculiar experience to us, for we are at a loss to know why it does not work, having a fall of about 8 feet to the furnace. We would be pleased to hear from Mr. Palmer again through the Letter Box.

In answer to article of "R. S.," Brooklyn, N. Y., will say that he seems to be of the same opinion as our friend Mr. Palmer of Harrisburg, and that the fire place is the cause of our trouble. We have experimented there to no avail, shut off the faucet, so to speak, but did not stop the leak. Will "R. S." be kind enough to let us hear from him again?

From H. R. D., Brooklyn, N. Y.—I see in *The Metal Worker* of March 9 an article from "C. S.," about a peculiar furnace experience, and in my opinion it is so peculiar that I do not wonder at it not working. I think the brick casing of the furnace is not properly constructed. It should be made of two chambers, an inner one inclosing the furnace proper, with openings at the bottom through which the air enters to the furnace, and an outer casing inclosing the inner casing with a space between the two and receiving the cold air supply at the top of the outer chamber. This cold air receives some heat in passing down by the inner casing and enters the air spaces at the bottom to the furnace radiators. "C. S." has no inside chamber to his furnace, which he should have. The mason work of the inside chamber should be well pointed and the joints tightly made and then whitewashed, as bricks absorb and give off a great deal of heat. The inside chamber should also be lined with tin. He introduces his cold air at the wrong place. It should be at the top, and the cold air pipe from the room in question should be connected in the same manner. This done, I see no reason why the furnace should not work properly if the furnace is large enough and it is set properly.

Which Is Best for Furnace Tops?

From J. C., Cleveland, Ohio.—Answering "T. O. M.," Adams, N. Y., on "Which is the best for furnace tops?" in *The Metal Worker* of March 16, will say that the cold air in question is taken from inside the house in a reception hall under stairway opening, being 27 x 27 and cold air duct the same. The rooms that give us trouble open into this hall both first and second floors. Off the furnace are taken four 10-inch and four 9 inch hot air pipes. From the above it will be seen that our air supply is ample. The furnace is centrally located, and we are sure it is not in the air supply. We would be pleased to hear from "T. O. M." again on the subject.

A strike of seamen at San Francisco for \$5 a month increase in wages has been met by the shipping of Japanese crews.

PLUMBING and GAS FITTING.

Open Work Fixtures.

In the large cities it is noticed by real estate agents and others who have property to rent that special favor is shown to dwellings where open work plumbing fixtures are used. This demand has been gratified for a long time as far as lavatories and water closets were concerned, but the economical disposition of the builder has held him to the wood incased bath, although persistent effort has been made to introduce cast iron baths and sheet metal baths of different character. It is claimed by those who are doing the work that the people are now demanding an exposed bathtub, and the manufacturers of such goods are constantly increasing their output to meet the demand. It is claimed that it is easy to sweep and clean around such fixtures, as there is no hidden space for an accumulation of dirt of any character. Various goods are made to meet these requirements, and plumbers will do well to keep informed of all the different kinds.

The I X L Vent Cap.

The accompanying illustration shows the I X L vent cap made by the Zero Valve Company, 304 Seneca street,

The I X L Vent Cap.

Buffalo, N. Y. It is made of malleable iron, and can be attached to any piece of waste soil pipe without calking and joined by simply adjusting a set screw, as no hub end is required. A wrought iron band clasps the pipe and is tightened to suit the size of the pipe. It is intended to cover the fresh air inlet or the top of the ventilation pipe above the roof.

Sanitary School Buildings.

It is quite possible that the following report to the School Board on the Mt. Pleasant school building at Nashua, N. H., by Irving A. Watson, secretary of the State Board of Health, is applicable to the buildings in many other cities.

The plumbing is faulty in several particulars and should at once be reconstructed. The effects in this respect are apparent to any one cognizant with what constitutes good plumbing. The service is deficient in traps and trap ventilation and defective in construction. The soil pipe should be ventilated into the open air above the roof instead of into the chimney flue. This pipe

should be of iron, with perfectly tight joints. The present pipe, constructed of sheet iron, with loose joints, is dangerously defective, and should be remedied at once.

In my judgment, the conditions which are the most dangerous to the health of the pupils consist in the so called ventilating system and its attendant evils. A plan like this, which provides the several rooms with an outgoing flue, but entirely overlooks the matter of providing for the entrance of fresh air, is an inexcusable oversight or neglect in providing for adequate ventilation. With outgoing flues which enter the several chimneys there is, especially in cold weather, a constant though slow exhaust of air from the schoolrooms, to supply which loss there is a forced draft upon every crack and crevice in the schoolroom. In the winter, when the windows are closed and the building made as impervious to outside air as possible, these flues amount to practically nothing in the way of securing fresh air for the schoolrooms. By reason of the exhausting force of the air escaping through the chimney flues the suction is put upon all the crevices that will admit air, including the defective ventilating flues from the water vault, as well as, possibly under certain conditions, from the soil pipe itself.

The fact exists that under the present system any defective connection with the public sewer or any unsanitary condition in the basement of the building is exceedingly liable to endanger the health of the school children, because the actual exhaust of deleterious gas, &c., must necessarily be through the school flues. These conditions in themselves constitute an ever present menace to the health of the pupils, but it is by no means all.

Aside from what has already been pointed out, the system of ventilation is deplorable; in fact, it can hardly be said to constitute a system. It is conceded by physicians, sanitarians and engineers who have made schoolhouse sanitation a study, that 1800 cubic feet of air per hour per pupil is necessary in order to secure at all times a healthful atmosphere in the schoolroom.

Many authorities place the figures considerably higher. In order to secure such a condition, there must be ample flues for the admission of fresh air, as well as corresponding exhaust flues.

The present system is practically one of direct radiation, which simply heats the same air over and over. A schoolroom that does not receive the amount of air indicated above soon reaches a state which is regarded as detrimental to the health of the children by reason of the excess of impurities which soon accumulate by exhalations from lungs, evaporations from the skin, &c.

It is conceded that unless the ventilation is ample to hold the carbonic acid gas thrown off chiefly by the lungs to below 10 parts per 10,000, the ventilation is insufficient. It is desirable that the carbonic acid gas shall not accumulate to an extent of more than 6 parts per 10,000, and in order to maintain this degree of purity in rooms like those of your schoolhouse, it would be neces-

sary to introduce constantly a large amount of warm fresh air during the winter season.

It is, perhaps, not necessary to elaborate this point at the present time. I only desire to impress upon your board the great need of better ventilation for this schoolhouse. I believe that its greatest sanitary defect is in the lack of ample ventilation.

Niagara Ejector.

The illustrations herewith show the Niagara ejector manufactured by S. J. Putnam, Princes Bay, N. Y. Fig. 1

Niagara Ejector.—Fig. 1.—General View

shows the ejector for use in urinal stalls, to be secured into the side of the flushing pipe, which passes across the stall. Fig. 2 shows the ejector with clamp for fastening to a slate slab when the supply pipe is run behind the slab out of sight. As may be seen from the cuts the lead supply pipe may be run to this extension and connected to it by a wiped joint. The ejector can be used

Fig. 2.—Ejector Arranged for Attaching to Slabs.

In connection with an automatic flush tank or owing to the small quantity of water used may be left to run continuously or operated by a stop cock. In operation a thin sheet of water is thrown against the slab through the slot opening as shown in Fig. 1. Fig. 2 shows the cap of the ejector partly removed and the hole through which the water is delivered. The seat against which the cap fits is cut away on the under

side for one-third the circumference so that the spray is spread. The force of the water at the outlet coming against the internal spherical head of the screw cap throws a thin fan shaped sheet of water against the back of the stall and over into the corners, flushing the entire surface.

A Unique Gas Fixture.

BY A VISITOR.

A guest of the Pen and Pencil Club of 1026 Walnut street, Philadelphia, finds considerable pleasure in being shown through their club house, the various rooms of which are adorned with mementoes of sporting, political and historical interest. No room, however, excites so great an interest and leaves so fixed an impression as the "Pirate's Den," from which is taken the subject of our illustration. This room is naturally rude and rugged in its finish and furniture. The ceiling and walls are made of slabs of natural wood, on which it is incumbent that

Thawing Frozen Pipes with Electricity.

Mr. Edmunds informs us, says the *Electrical Review* of London, England, that he has been making some experiments lately with most complete success in what we think is a new and important application of electricity to domestic use. He, like many others, has suffered the inconvenience of having his gas and water service frozen during the late severe weather. It occurred to him that a resistance, suitably protected, might be introduced into those pipes which were most exposed and least easy of access with flame or hot water or other ordinary method of thawing. He had a special wire made in which the current was conducted through a highly resistant metal, insulated with a fire-proof medium that was also a non-conductor of electricity. The whole was inclosed in a metal tube, which could be drawn down to make a compact wire or tube that was externally a conductor of heat, but not of electricity, thus preventing loss of current and

oxide on account of the high temperature necessary to fuse it, and never gives the trouble caused by other alloys. Sheet lead scrap or tea lead make good solder, and the failure to clean solder by the use of sulphur is often due to the fact that no tin, or not enough tin, is added after the process to make up for what has oxidized, and also to not removing the sulphur by the use of tallow.

Suit for Defective Plumbing.

A man in this town, says the New York *Sun*, brings suit against his landlord for damages for the loss of his daughter, whose death he attributes to the insanitary condition of premises occupied as a dwelling house. The principle governing a landlord's liability in these cases is well settled in England, but is hardly likely to be established in the same way in this country. The rise of the doctrine there is peculiar. The first suits were brought by landlords against tenants for non payment of rent, resisted by the tenants on the plea that the premises were insanitary.

There was a statute in existence designed apparently for the protection of the tenants, to which they generally appealed to sustain their side of the case, which, under the said statute, they generally lost, owing to its phraseology. But in the course of construing the statute the courts laid down a series of principles which soon combined to create a general case lying altogether outside of the statute. While this general case did not sustain the tenant in his refusal to pay rent, it did give him his action against the landlord for damages as to injury received in health through an insanitary condition of premises.

Next came the cases of householder and the town, landlord and the town, and, finally, contractor and the town. The duty of the town under general statutes is to remove garbage effectively. The householder would bring his action against the town for injury to his health through neglect to remove the garbage promptly. The town pleaded a proper contract made with a contractor. The decision was that the duty of the town was absolute; it was responsible to the householder, to whom it must respond, and might afterward pursue its own action against the contractor for any neglect under his contract. If the injury arose through defect in the sewer or other matter under the control of the town, the landlord had his own action against the town, but could not plead the town's neglect as a defense against his tenant.

And so on. The net result at the present time is that the health of the inhabitant is treated as the dominant interest, on the principle, *Salus Populi suprema lex esto*. If injured, the person with whom he immediately deals must respond. If this person's loss be due not to his own neglect or misdoing, but to that of the town, the town in turn must respond to him. The only recourse left to the town is against a contractor, provided one of these and not its own officers be to blame. From this it will be seen what a very long road statutory construction has yet to travel in this country before anything like these principles can be established.

HIGGINS & GRIFFIN have bought out the plumbing shop of C. B. Allen & Co., Salem, Mass., and will continue business at the old stand.

A Unique Gas Fixture.

each member shall carve his name, and no little artistic taste and skillful handiwork is displayed in fulfilling this requirement. Some are on the ceiling, some against the rafters, some run horizontally, others obliquely and a few are upside down. Seats are made of empty beer kegs, cushions being made of coils of rope. These surround a massive table, and the awful rules and regulations which govern all who enter this apartment hang conspicuously on the cupboard door. The den is lighted by a gas fixture. The pendant drops through a Turk's head cake mold of tin nailed to the ceiling and passes down into an empty "sextle" beer keg. Six branching arms radiate from the keg to the burner key. The burners pass up through stone beer mugs, having holes drilled through the bottom. Above each burner a bright tin stew pan is nailed to the ceiling, the handle pointing away from the center. This novel fixture is well adapted to its surroundings, and the brilliant light it sheds is no more brilliant than the repartee that passes between frequenters of this by no means gloomy den.

MAYOR COOK of Gloucester, Mass., has signed a new plumbing ordinance which is now in effect in that city. It calls for a water test, trap ventilation, local vents to closets, permits and plumbing inspection.

electrolysis. The results were most satisfactory. This "thermic" wire was introduced into the waste pipe from a bathroom at the north side of his house, which entered a fall pipe some 20 feet from the ground and which was easily frozen. The thermic wire was introduced from the outside. At night a small stream of water trickling down froze, forming an icicle some 12 inches long and 1½ inches thick, completely locking the waste pipe. The thermic wire having been previously connected with Mr. Edmunds' electric light circuit, at 50 volts pressure, when current was turned on 4 amperes flowed through it, and in four minutes a complete thawing was effected and the waste service was cleared.

Cleaning Solder.

BY OLIVER TWIST.

To make and to keep good solder it is necessary to be very careful as to what is put into the melting pot, for old lead pipe, lead tacks, &c., often contain zinc, antimony, copper, arsenic and other ingredients. Type metal is sometimes used under the impression that it is lead, whereas it is alloyed with 20 per cent. of antimony, which is as ruinous to solder as is zinc. If iron be contained in solder it is readily removed by stirring and skimming, as it is usually in the form of a powder or

Toronto Master Plumbers.

The Toronto Master Plumbers' Association held their annual meeting in Forum Hall on Monday, March 25, and elected the following officers:

Thos. Cook, president.

W. I. Burroughes, first vice-president.

Geo. Guest, second vice-president.

I. K. Allison, secretary.

A. Fiddes, treasurer.

W. I. Garratt, sergeant-at-arms.

The new officers of the association have a large amount of work before them in getting out a new retail price-list and new by-laws for the association, &c. A special committee was appointed to wait on the city to obtain amendments to the city plumbing ordinance to reduce the license fee, and to restrict the granting of licenses to qualified plumbers only, also that all drains shall be of cast iron and under the control of the plumber, and that in future no license shall be granted unless the applicant has passed a practical examination. It is also proposed that steps will be taken to form a Dominion or National association. The Toronto association is now in a flourishing condition. Twenty-five new members were enrolled. Trade in the city is fairly good and the prospects for a good summer are favorable.

The Report of the Essay Committee.

Under date of March 30 the following report will be sent to local associations of master plumbers by the Essay Committee of the National Association of Master Plumbers, composed of Jeremiah Sheehan, chairman, Thomas Cantwell, Frederick Abel, John F. Reardon and F. R. O'Neill:

The Essay Committee, appointed to report a series of topics to be submitted to the master plumbers for treatment at the next annual convention, beg leave to submit the following list of subjects, which it regards as timely and which relate directly to the main purpose of our association. In order that the committee may have time to review the essays, which it is necessary to do before presenting to the convention, all essays must be in the hands of the chairman of the committee on or before May 15.

Is the association of supply houses beneficial to the master plumbers of the country? If not, how can it be made beneficial? This subject is suggested because the most important event of the year, having a direct relation to the interests of the plumbing trade, has been the action of all the leading supply houses and manufacturers of the country, entered into for the purpose of united action on questions of policy in dealing with master plumbers and others who are in the relation of retailers. Possibly there may be suggestions as to some means by which, through the intermediation of the National Association of Master Plumbers, this new organization may be made of avail as an agency of good, whereby some of the evils which have impaired the prosperity of the plumbing business throughout the country may be eradicated.

To what extent may municipal legislation be relied upon to enhance the standing of the master plumber? Is it not in some cases a bolster and an indorsement to the unworthy? The utterances of many master plumbers during the past two years have made it a mooted question whether, in view of the laxity, favoritism and even corruption which characterize political govern-

ment, plumbing ordinances can be relied upon to accomplish the purposes which they are designed to serve. To invite full and candid discussion, the above topic is framed in a form seeming to favor the negative.

Would not the interest of the master plumber be served by an agreement that master plumbers should not handle tools? This question is suggested by the fact that many master plumbers are heard to complain that local associations, although intended to benefit all their members, work really to the disadvantage of some. The complainants, as a rule, are men who carry on plumbing as a business, rather than as a trade, and who hold that while membership in the association is accepted by the community as a guarantee that a plumber is competent and reliable as a contractor, his competitor who invests his money in advertising the trade and raising its standard is placed at a disadvantage when it comes to making estimates. In other words, the proposition is advanced that all members of a local association should be strictly master plumbers; while if they continue to handle tools they compete as master plumbers, but do the work as journeymen.

What should be the qualifications of a member of a master plumbers' organization? In other words, is it sufficient that a candidate shall be competent to wipe a joint? This subject is intended to elicit suggestions as to the improvement of the standard of membership in master plumbers' associations. The first purpose declared by all such associations is that of elevating and improving the plumbing business so that not only the plumber but the public will be benefited. It is urged by those who are not satisfied with progress thus far made that it is too easy a matter to become a master plumber, and that the standard in place of being bettered is lowered by the indiscriminate admission of candidates for membership. For instance, should a candidate be able to estimate the value of work and material before calling himself a master plumber? Should he be able to pay his bills? Or is it enough that he shall be able to pay an initiation?

What are the abuses that have been developed in the master plumbers' organization? What is the remedy? This question is suggested by the indications that the trade has not attained the prosperity which so many of us confidently expected would result from organization. If this failure be due to the faults of organization or to the practices that have grown up under it, it will be timely information to detail just what these faults and practices are.

Should not the master plumber decline to bid as a sub contractor? Should he not insist that the plumbing be reserved from the general contract? The above question is suggested by the fact that the contracting business has become so general that even the most incompetent carpenters are now recognized as general bidders, and the architects in their desire to avoid a division of responsibility are disposed to require the plumbers to submit their bids to these men. In many cases these general contractors are utterly irresponsible in a financial way, and the trade has suffered greatly through their failures. It should require no argument to demonstrate that a man who is competent to design and construct a good, handsome and sanitary plumbing system in a residence is too good a

man to be subordinated to such incapables as are many that are now bidding on even high grade work.

TRAPS AND VENTS.

ALL the clay sewer pipe manufacturers of Ohio, Virginia, New York and Pennsylvania, except one, have formed a combination under the terms of which all sales are to be made from Akron, Ohio, and Pittsburgh, Pa.

CONSIDERABLE information about the sewerage in foreign cities is to be found in No. 173 of Vol. 47 of the Consular Reports to the United States Government.

THE GOULDS MFG. COMPANY have just begun the erection of a new addition to their extensive works at Seneca Falls, N. Y. The building is to be of the slow burning type, will be 86 x 35 feet in size, the frame work, beams, columns and roof truss of steel, and two stories in height, with basement for the storage of castings. The main room for heavy machines and erecting purposes will be 22 feet high and will be served by an electric bridge crane of 10 tons capacity. The walls will be of brick with the skylight and upper windows glazed with ribbed glass. It is expected that the building will be completed about June 1.

JOHN BIRMINGHAM, South avenue, Bridgeport, Conn., who has been making a specialty of jobbing plumbing work, intends to go into contract work as soon as the building season opens.

WOODRUFF & WHITE succeed O. I. Jones in the tinning and plumbing business in Westport, Conn.

THE HERCULES FLOAT WORKS is the name of a new corporation organized in Springfield, Mass., for the manufacture of the Hercules seamless copper ball floats for steam traps, receivers, &c. The officers of the new company are: President and treasurer, Harry S. Anderson; clerk, R. H. Parkhurst; directors, H. S. Anderson, H. H. Parkhurst, Frank Engelhard and Fred H. Engelhard. Manufacturing room has been secured at 54 Taylor street. The hollow copper ware of which the company make a specialty is produced by a new patented process without seams and of a quality superior, it is claimed; to hard rolled metal, being perfectly even and homogeneous throughout, without flaws and wholly impervious to water.

J. J. CASHEN, who was for a long time with Wm. B. Cashen on State Street, Meriden, Conn., has established a business for himself at 65 Church street, where he has a commodious store and a good stock of plumbing and heating goods.

THE MECHANICS' SUPPLY COMPANY, Quebec, Canada, are inserting in the business directories published in Montreal, Toronto, Quebec and Halifax a colored advertising page in which they direct attention to their extensive line of goods. Among the particular articles noted are steel clad baths, Jenkins valves and packings, L. S. Starrett Company's fine machinists' tools, steam pipe packing, &c.

AN OBSTINATE blaze was extinguished by the Fire Department last Saturday night, located in the basement of James Duffy's plumbing shop, at 124 Main street, Hartford, Conn. The loss was covered by insurance.

R. M. WILSON of Rome, N. Y., reports from the New York office, 92 Walker street, New York, that a nice trade is being done in nickel plated and copper boilers. It is stated that planished copper boilers, although heavily lac-

quered, do not hold their color satisfactorily in use, and that a growing demand is being felt for a nickel plated boiler, as the nickel plate can be kept polished bright without destroying it.

WHEN two plumbers entered into a copartnership agreement to carry on the plumbing business in Kingsbridge, N. Y., they inserted in the articles a clause to the effect that if either of the partners at any time took to the use of intoxicating liquors to the extent that it might interfere with the conduct of the business, the sober partner might have the right to ask for the dissolution of the firm. Acting on this clause, one of the partners made an application in the Superior Court asking that the firm be dissolved and a receiver be appointed. He says that the junior partner has not respected the agreement. The other partner contested the motion, stating that he had affidavits to the effect that he had never so far forgotten the clause as to put the business of the firm in jeopardy. Decision was reserved.

ALLEN WEINHARDT will go into the plumbing business with John Freitag in the place formerly occupied by Dickhout on Wabash avenue, Terre Haute, Ind.

S. A. WORTHING has purchased the interest of Mr. Osler in the plumbing business of Brock & Osler, Redlands, Cal.

A DEPUTATION of employing plumbers, Toronto, Canada, consisting of Messrs. Allison, Burroughes, Beavis, Cook, Fiddes and Guest, had an interview with the City Engineer recently. They asked that the license fee now paid by plumbers be abolished, and that the clauses in the city plumbing by-law providing for the examination of plumbers, with a view to testing their efficiency, should be enforced before applicants are allowed to undertake work as an employer.

THE APPLICATION of Blake & Murphy, Galesburg, Ill., for a plumber's license, with J. E. Maley and D. Morley as sureties, was granted by the City Council.

AN ORDINANCE regulating the licensing of plumbers in the city of Bradford, Pa., has been passed.

A. R. JORDAN is making improvements in his plumbing shop on West Broad street, Westerly, R. I.

CURTIS BROS. will open a new plumbing, heating and gas fitting establishment at 597 Main street, Dubuque, Iowa.

THE FIRM of Daggett & Schwie Company, Mason City, Iowa, have been dissolved. Messrs. Daggett and Schwie will continue the plumbing and heating business and C. Currie & Son will run the hardware store.

FRED. DOYLE and JOSEPH CASPAR compose a new plumbing firm at Houghton, Mich. They are building a new shop on Sheldon street, which will be 16 x 40 with plate glass front.

THE FIRM of Smith & Jeffs, plumbers and tinsmiths, at the Highlands, Mass., has been dissolved by mutual consent. Mr. Smith having purchased the interest of his partner will carry on the business at the old stand.

ALBERT C. WEIANT, New Britain, Conn., visited *The Metal Worker* office this week and showed a new pipe support for which he is taking out a patent. The support can be attached quickly, and holds the pipe far enough

away from the wood work to permit the use of a pipe wrench and prevent unions, cocks and fittings throwing the pipes out of a straight line.

THE GLAUBER BRASS MFG. COMPANY, Cleveland, Ohio, are issuing a colored picture bearing at the top an inscription stating that "Glauber's famous stop and waste cocks are the world's best and leaders over all others." At the bottom, several styles of their cocks are shown in natural color.

THE S. H. MORGAN & Co. plumbing and gas fitting firm have filed articles of association with the county clerk at Detroit, Mich.

JOHN F. DEEDY opened his new store in Rogers Block, at Salem square, Worcester, Mass., last Saturday, and in the evening he had a formal opening. Visitors found one of the most thoroughly equipped stores of the kind, the stock including everything in the plumbing line from the materials used in cheap houses to the costliest fixtures used in the palatial residences of mill-

rendered stiff by a special process, while at the same time they can be drawn to any extent required. Full price-lists are also given.

JOHN A. MANGOLD, graduate of the New York Trade School plumbing class of '93, intends to open up a plumbing shop at Moundsville, W. Va. As water works are being put in the town a good deal of plumbing work is in sight.

THE FOLLOWING DELEGATES were elected at the meeting held by the Chicago Master Plumbers' Association on the 25th inst., to attend the Illinois State convention to be held at Rock Island April 24: J. B. Breen, J. R. Alcock, P. Sanders, D. J. Rock, C. J. Herbert, M. L. Mandible, Charles T. Byrne, Paul Radieske, Thomas Conway and J. L. Emblen.

AMONG the new plumbing establishments recently started in Chicago can be mentioned the following: Daniel Galvin, 3246 South Canal street; Henderson & Thole, 22 North Ashland

The Quick Meal Vapor Store, Showing the Balanced Oven Door.

lonsaires. The display also contained Mr. Deedy's own inventions. The north half of the store is fitted up to show the practical working of the newest closets, lavatories, &c. It shows the latest designs in bathtubs, and the lavatories are elaborate affairs, being made of different kinds of marble. The closets are all in working order and show the different kinds of hoppers, some of them being tastefully decorated. The tanks are in keeping with the rest of the materials and are of oak, Hungarian ash, dark cherry, bird's eye maple, natural cherry, antique oak, white enamel and ash, with seats to match. In the rear are located the storerooms and the workrooms, where Mr. Deedy makes all his own traps. In the cellar are the other workrooms. The suit of rooms also includes a general salesroom and a private office.

CURTIS BROS. have leased the storeroom at 597 Main street, Dubuque, Iowa, and will open a first-class plumbing, heating and gas fitting establishment.

E. W. BLATCHFORD & Co., Chicago, have just issued a small but excellent catalogue of their lead traps and bends. The variety illustrated is very large, covering all possible requirements of the trade. The Blatchford drawn and compressed lead traps and bends are made in the same manner as lead pipe,

avenue; Thomas Forbes, 795 West Van Buren street; Clayton & Miller, 475 West North avenue.

WALTERS, REILLY & WAFER is the name of a new firm of plumbers reorganized in Fort Dodge, Iowa. They will have their headquarters in the new addition to the Doud Block.

The Quick Meal Balanced Door.

An interesting feature of the Quick Meal vapor stove, which is being offered the trade this season by the Ringier Stove Company of St. Louis, Mo., is the balanced oven door. The arrangement is such that a weight working inside of the flue and connected directly to the hinge of the oven door allows the latter to fall to a horizontal position, where it forms a convenient shelf. An idea of the arrangement of parts may be gained from an inspection of the accompanying illustration, which represents the stove with a portion of the side broken away so as to indicate the position of the weight referred to. This weight is of such a character as to balance the door and allows it to fall without noise and also without danger of breakage. When the oven is in use the weight swings toward the front, where it assumes a horizontal position and offers no obstruction to the flue.

Air Blast Apparatus.

The J. F. Pease Furnace Company, Syracuse, N. Y., have devised an apparatus for the efficient and clean burning of bituminous coal in hot air furnaces, which is illustrated in the accompanying cuts, Figs. 1 and 2. It is well

easily set, fitting into a cup joint on the top of the fire pot, and is provided with a cup joint on its top, on which the combustion chamber rests. The pipe connections and fittings can easily be put together with an ordinary wrench. These rings are provided for the Pease furnaces Nos. 308 to 320, inclusive, of the Regular Low Down Double Radi-

furnace of the J. F. Pease Furnace Company, the dome of which is somewhat higher above the outlet than in any other furnace. It is further mentioned that the use of this small sectional air blast ring aids in the combustion of soft coal, although for most kinds of this

Air Blast Apparatus.—Fig. 1.—Soft Coal Burning Apparatus, Fire Pot and Ring

known that the burning of soft coal for domestic purposes has always been attended with difficulty arising from the formation of soot, which adhered to the heating surface, clogged the flues and reduced the radiating powers of its surface, and sometimes even going so far as to fill up the smoke exit and materially interfere with the draft. To secure complete combustion of bituminous coal the system devised by the J. F. Pease Furnace Company provides for the introduction of hot air around the surface of the fire. The air being about one-quarter oxygen stimulates combustion and consumes the otherwise unburned gases. In the device illustrated in Fig. 1 the air is drawn into the ring through three supply pipes, two in the front and one in the rear. Each of the air chutes is provided with a regulating door, so that the supply of air can be adjusted to suit the draft and other varying conditions. The air is heated to a high temperature in passing through the supply pipe and through the heated ring and is distributed over the face of the fire through horizontal slots shown in the illustration. It is mentioned that the outlet area of all of the slots is less than that of the intake pipes, so that the air is discharged in full volume from each slot. Fig. 2 is a transverse section through the ring showing the form of the interior and the course taken by the air. The slots, it will be noticed, are protected by a canopy which prevents fine particles of fuel lodging in the openings when the fire is replenished. This feature is particularly alluded to and it is mentioned that it is covered by patents. The ring is said to be

ator and Tropic patterns, as well as in all sizes of the 1895 pattern. It is furthermore mentioned that they can be introduced into old furnaces of these patterns with little expense and work.

Fig. 2.—Transverse Section through Air Blast Ring.

Among the improvements brought out by the J. F. Pease Furnace Company is an air blast for hard coal also. They mention that while the combustion of bituminous coal is very much improved by the intermixing of hot air—that is, oxygen—it is also pointed out that the burning of hard coal is likewise improved by the use of similar appliances. In Figs. 3 and 4 is illustrated an air blast designed for use in hard coal burning furnaces. It is said to be particularly well adapted to the 1895 pattern

Fig. 3.—Sectional Air Blast for Hard Coal Furnaces, Correct View.

fuel a larger ring is recommended. Fig. 3 shows the correct position of the distributor, while Fig. 4 shows it with the lower sides presented to view. It is fitted to the inside of the combustion chamber immediately over the top of the pot and directly opposite the feed door. The one air supply pipe runs down the

Fig. 4.—Reverse View of Section.

back of the fire pot and terminates outside the casing in an air chute with a regulating door.

THE MORTON TIN PLATE COMPANY, Cambridge, Ohio, whose advertisement appears upon another page, announce that they are prepared to commence the manufacture of Tin and Terne Plates. The brands will be Morton Charcoal, Guernsey Coke and Leatherwood Terne, all made by the Morewood process. The company have been manufacturing Black Plates since the beginning of the year, and their product has found favor among dipperers. They state that the same care that has been exercised in the manufacture of Black Plates will be carried out in the case of the Finished Plates, only high grade qualities being produced. No selling agents have been appointed by the company, their intention being to dispose of their product direct from headquarters at Cambridge, Ohio.

It is reported that the syndicate of New York and Philadelphia capitalists who are building the electric roads in and about Baltimore and Washington, have organized a company with a capital of \$4,000,000, to construct an electric railroad between New York and Atlantic City, N. J.

The use of terra cotta is becoming so widespread that the question of how to treat the surface of this material so as to render it less liable to injury and decay, without impairing its appearance, is one of considerable interest. European journals announce that an effective method of treating terra cotta has been recently introduced by E. Fortora of Naples, Italy, a place where this material is largely used for decorative purposes. Mr. Fortora recommends that the terra cotta be immersed in a bath of paraffine wax at a temperature above the boiling point of water, but below that of wax. All moisture and air are said to be expelled by this treatment from the pores of the material, and an absorption of the molten wax takes place. It is claimed that all porous material of the character of terra cotta is vastly improved when subjected to this treatment, and is, moreover, rendered quite impervious to water.

STEAM AND HOT WATER.

An Unusual Combination System.

The system of heating and ventilation used at the Andrews M. E. Church, on the corner of Richmond and Fulton streets, Brooklyn, N. Y., the plans of which were prepared by architects Kramer & Simonson, Metropolitan Building, New York, is, from its unusual character, one of more than ordinary interest. The plant was installed by S. G. Richards of 1454 Broadway, Brooklyn, N. Y., and designed by W. E. Roys, heating engineer. The heating system provides for an influx of warm fresh air, also a more direct and

arranged by means of dampers of a special construction so that the air may be discharged into the lecture room when desired, the lecture room being on the same floor as the furnace and the pipes to the church running through it. Beside the hot air furnace is placed a No. 5 Pride of Brooklyn steam heater of pipe construction, from which the steam mains run to direct radiators located in different parts of the church. The smoke pipe from both the steam boiler and the hot air furnace connect with an 18-inch pipe made of No. 16 iron, inclosed in the ventilating shaft, which is 30 x 56 inches in size and divided into two flues, each 15 x 56, by

with a radiator of 55 feet of surface and a 1½-inch riser is taken from the end of the main to a radiator having 44 feet of surface in the Epworth League room immediately above. One-inch branches are also taken from this branch main to two class rooms on both the first and second floors, having respectively 22 and 17 feet of surface in the radiators. The other 1½-inch branch main continues this size until connections are taken for two class rooms on both the first and second floors, having respectively 22 and 17 feet of surface in the radiators in them. Then the main ends in a 1½-inch riser feeding four radiators, two in large class rooms on the first

An Unusual Combination System.—Fig. 1.—Showing Heating Apparatus and Piping.

positive system of heating, and a method of exhausting the air from the church to secure ventilation. The fresh air is supplied by a No. 57 Pride of Brooklyn hot air furnace located as shown in Fig. 1, which is a plan of the lecture room and cellar of the church. It was installed in the cellar and supplied with air from out of doors by means of an air duct having inside dimensions 20 x 32 inches. The air when heated is conducted to the lecture room of the church and to the Sunday school room by means of 14 inch tin pipes leading to registers in the floor, there being two registers in the church and in the Sunday school room, as shown in Fig. 1. A plan of the church and Sunday school room is shown in Fig. 2. Fig. 3 shows the gallery of the church and the arrangement of the class rooms and Epworth League room above the primary room. The two pipes which lead to registers in the floor of the church are

means of a partition. In the sides of these ventilating shafts, both in the church and in the Sunday school room, large registers are placed near the floor, and a current of air is drawn from the church through them by means of the heat imparted to the shaft by the sheet iron smoke stack. A Jackson grate in the Epworth League room affords means of heating it when there is no other fire in the church, and also aids in ventilation.

From the top of the steam boiler a 3-inch main is taken, merging into two branches, a 2-inch main running under the Sunday school room, a 1½-inch branch being taken to a radiator of 33 feet of surface in the vestibule. Then the main continues 2 inches in size until it reaches a point under the class rooms, where it separates into two 1½-inch branches, one branch running to the primary school on the first floor, where a 1½-inch connection is made

and second floors, having respectively 33 and 28 feet of surface, and two in smaller rooms having respectively 22 and 17 feet of surface. Immediately beneath the steam main the return pipe for the condensation from each end is run 1 inch in size, receiving the condensation from all the radiators mentioned and merging into a 1½-inch return running over toward the boiler.

The other branch from the 3-inch main from the boiler is a 2½-inch main which extends toward the front of the church, a 2-inch branch being taken to one side of the church where a 1½-inch riser is taken from a coil having 90 feet of surface in the gallery. From this point the main continues full size to another radiator having 133 feet of surface, near a large window in the auditorium. The principal main continues beyond this branch 2 inches in size, a 1½-inch radiator connection being taken to a radiator having 48 feet of surface at one

side of the vestibule. The main makes a right angle turn at this branch toward the side of the church and continues 2 inches in size until a connection is taken

from each of the mains just after they leave the boiler and run to radiators of 32 feet in the vestibules at each side of the Sunday school room. There are two

afforded by large ventilators in the ceilings of both of the larger rooms, and to carry off the heated air when the audience has assembled and the lights

Fig. 2.—Plan of Main Floor.

to a radiator having 24 feet of surface at the other side of the vestibule. After this connection the main is reduced to 1½ inches, running toward the side of the

returns for condensation, each beginning at one of the radiators in the vestibules and running around the side of the church, increasing in size and

are used in the evening. In operation the plant has given excellent satisfaction, the fresh air furnished by the hot air furnace providing an agreeable atmos-

Fig. 3.—Plan of Gallery.

church, where it makes another turn, and a 1½-inch riser is taken to a radiator having 113 feet of surface. It then continues 1½ inches in size to a radiator having 80 feet of surface near the choir. Separate 1½-inch branches are taken

connecting with all the radiators until two 1½-inch branches meet the 1½-inch return from the Sunday school room, where they merge into a 2-inch return which is connected with the boiler.

An additional means of ventilation is

there and the radiators carried by the steam boiler affording a heat that is more than is necessary for the early fall and late spring. The ventilating shaft has been very effective in carrying off the colder air in the lower portion of the

church, making it easy for warm air to flow in when the church is being heated by the furnace. A feature of the plant which has been found specially pleasing is its ability to heat the church without

The Lily Steel Hot Water Heater.

Rubel & Co., 77 Lake street, Chicago, have just brought out a new hot water

The Lily Steel Hot Water Heater.—Fig. 1.—Broken View.

overheating by means of the hot air furnace when the weather is mild, and the steam radiators have been found sufficient for the coldest weather.

For those who desire to make further calculations on this heating plant it may be stated that the ceiling of the church proper is 40 feet high in the center and 20 feet on the side walls, while the ceiling of the Sunday school room is 35 feet high in the center and 25 feet high on the side walls, and that the class rooms, lobby and Epworth League rooms extend only two stories in height, the ceiling of each floor being about 9 feet. In addition to the arrangement of the hot air furnace for heating the lecture room, the steam pipes which run through it are used as a heating surface, not being covered. The ceiling of this room is about 9 feet high.

W. H. HARRIS of the Standard Radiator Company of Buffalo, N. Y., visited Manager John Leitch and his assistant, Frank C. Perew, at the New York office, 206 Centre street, this week. Mr. Harris was returning from a short sojourn in Florida.

heater, named the Lily, on which they have applied for a patent. It is here-with illustrated. It is of the vertical type, with horizontal sections, circular in form. The sections are easily con-

nected or disconnected, so that their number may be increased or diminished as desired. The connection is formed by a nipple, which firmly unites the sections and allows the free passage of the heated water.

The broken view of the heater, Fig. 1, enables the distribution of heat and the circulation of the water to be easily

explained. The fire chamber section has a number of circular holes in the top, through which the heat of the fire and products of combustion pass, being directed around the several sections by baffle plates until they reach the chimney connection at the top. The baffle plates, as shown in Fig. 2, are so arranged that they can be turned to any position, enabling the pipe collar to be shifted to any part of the top of the heater. The water circulation is arranged very efficiently. The return pipes discharge cold water into a water jacket around the fire chamber. As the water is heated it passes upward into the first section. Here a square diaphragm is encountered which causes the water to pass to the sides, becoming more highly heated on its passage and finally ascending to the next section, where the same thing occurs, and so on until the flow pipes are reached at the top. A large door in the top casing enables the smoke flues to be easily cleaned.

The manufacturers believe this to be the first sectional hot water heater made entirely of steel. No cast iron parts are used in the heater itself, but only in the grate, door frames, &c. Eleven sizes will be furnished, ranging from the smallest, with a capacity for 600 square feet of radiation, to the largest size, rated at 3000 square feet.

Ventilation.

From SAMUEL HEINS, Roundout, N. Y.—On the subject of ventilation, which is a very important one, I have a few words to say and on the popular errors which should be corrected. There are many readers of *The Metal Worker* who I know are interested in this subject, which I consider one of the most important things of a building, and the people who contemplate building should give their especial attention to the ventilation as well as the plumbing. For the last five years I have made a thorough study of this branch. There are many fairly well educated persons who cannot understand that ventilation does not necessarily mean an open window or a draft of wind, and who would fancy themselves ill provided with pure air even in the best ventilated rooms wherein these objectionable features were not certain evidence to the eye and feeling that some outside air was entering. The two ideas of wind and coolness form the whole of the public knowledge in regard to ventilation. There is also the incidental belief that foul air rises and that there must be

Fig. 2.—One of the Sections with Baffle Plate.

some means provided for letting it out. This idea takes concrete form in the little whirligig seen in so many office windows and in the tendency toward opening windows at the top on general principles. The general belief and tradition is to make a hole somewhere in the upper part of the room and then all foul odors, bad air and other improper things

in the atmosphere will quietly and of their own accord and free will let themselves out. In these crude ideas we have practically all that the public knows or cares about ventilation. In the actual practice of the individual there is no intelligent appreciation of pure air, nor can most people tell whether the air they breathe is fit for respiration. Even people belonging to the educated classes do not use the evidence of their senses in regard to the quality of the air in their houses. It is the duty of sanitary and ventilating engineers to educate the public up to a higher plane as regards ventilation, and in order to do this there must be more general appreciation of the difference between pure air and foul air from their own characteristics rather than from circumstances which have nothing to do with the case. This means, of course, that attention must be given to methods for testing the quality of air in and of itself, without reference to visible means of supplying it or to its available effects upon the surface of the human body. When this educational work has been accomplished the field of the engineer who devotes himself exclusively to ventilation will be the widest of any belonging to the engineering profession.

HEATING NOTES.

S. T. WILLIAMS is again on the engineering staff of Geo. B. Cobb & Co., 96 Centre street, New York.

THE ARMSTRONG MFG. COMPANY, 139 Centre street, New York, report that recently they have been quite busy on orders for their hand pipe cutting tools and adjustable dies for threading pipes. They say that there is a steadily increasing demand for their goods all through the country and that many pipe fitters that use solid dies for shop work consider a set of their adjustable dies indispensable for outside jobbing work.

J. A. GOODRICH of the American Radiator Company, 92 Centre street, New York, is enjoying a well earned vacation in Bermuda.

THE ORIENT RADIATOR, made by T. C. Joy & Co., Titusville, Pa., will be used in the Sachs Building, Twenty-fourth street, New York, 10,000 square feet of surface being required.

DWIGHT SMITH, who has been recently engaged in the plumbing and steam heating business in Penn Yan, N. Y., has returned to Canandaigua.

A WRITER in a Philadelphia paper, in defense of steam, says in answer to the following statement: "The era of steam is passing away." "There is no electric power or heat that does not trace back to a steam boiler except where there is water power. The product of steam—electricity—can never exceed its producing power; this is a common sense principle.

A GAYLY COLORED PICTURE, cleverly imitating a special water color work by Archie Gunn, is the decorative feature of a calendar issued by the J. H. McLain Company, Canton, Ohio. Instead of sending the calendars at the time of the year which is usual for distribution, they have delayed it until the month of March, and we do not doubt they will reap benefit from distributing them at this time, when so many of the January calendars have been lost. The picture shows a young woman in spring-time garb and surrounded by springtime associations, and represents, we are told, "An American Girl Up to Date."

T. C. JOY & CO., Titusville, Pa., are showing at their New York office, 48 Centre street, a sample of their new Zenith radiator, which occupies less space than the ordinary loop radiator and has a large flue surface. They have a new catalogue in course of preparation which will show their different radiators and pictures of some of the prominent buildings in which their radiators have been used.

AS AN INDICATION of the prominent part the manufacture of steam fittings and heating apparatus is playing in the industries of the country, it may be mentioned that according to the last census these products were valued at over \$23,000,000, and there has been a great increase in business since the last census was taken.

THE UNITED STATES HEATER COMPANY have completed their new factory at Detroit, Mich. The machinery was started a few days ago and the entire plant is now in full operation. They have a very complete and well equipped establishment and advise us that they are prepared to fill all orders promptly.

THE CATALOGUES issued by M. Mahony, Troy, N. Y., relating to the Mahony vertical section boiler for steam or hot water heating are attractive publications of convenient size. The leaves are held together by a silk cord at the back instead of being bound in the usual way, and have covers of tinted paper. General and sectional views are shown of both types of boilers and views of the separate sections of each are likewise presented; also a picture of the grate, as well as smaller illustrations of the other boilers made by Mr. Mahony. The cuts are finely executed and finely printed also, and the accompanying text gives a full description of the boilers, which are the same as were recently illustrated in *The Metal Worker*. The steam boiler has a capacity ranging from 1600 to 2700 square feet and the water boiler from 2700 to 4500 square feet.

EXETER RADIATORS are being used in Mr. Jenkins'—of the firm of Jenkins Brothers, valve manufacturers—elegant new residence on Beacon street, Boston.

LOCKWOOD & ADAMS, 69 Centre street, New York, have added to their line of radiation the Napoleon radiator made by Moore Brothers & Co. of Elizabeth, N. J.

JOHN A. SCOLLAY, 74-76 Myrtle avenue, Brooklyn, and 89-91 Centre street, New York, is furnishing a Brooklyn street directory and city guide, on the front of which is a cut of his hot water apparatus, and a notice that he makes a specialty of apparatus for heating residences and greenhouses.

THE ELEVATORS in the public buildings in Philadelphia recently dropped to the cellar at the time of the day when they are most in use. Those who were on them at the time were more or less frightened. The trouble was caused by a section of the 14 inch pipe in connection of the hydraulic lift giving way. The pipe in question had been tested up to 100 pounds and was $\frac{1}{2}$ inch thick. For several hours during the day of the accident it was run at a pressure of 125 pounds, in order to do the work that was ordinarily done by another system. After carrying this pressure for several hours one section split, flooding the cellar and dropping the elevators. On examining the pipe after the accident it was found that throughout

its entire length only a thin film of the metal on the outside had thoroughly fused in the mold. Under the examination the fracture showed that the metal had run together along the entire length of the pipe, but had only fused on the outer side for a very slight thickness, and showed an extended case of "cold shut."

E. W. STRADLING, president of the Stradling Plumbing & Heating Company, Utica, N. Y., was one of the visitors at *The Metal Worker* office this week. Mr. Stradling reports that his company have set a large number of the Royal boilers and is much pleased with their work this winter.

THE UNITED STATES HEATER COMPANY, Detroit, Mich., send out one of their postal travelers showing on the back a general view of their works. The text on the front of the card tells the hard times they had in filling orders last year, because they were in the hands of their friends. Now they are making their own goods and can ship promptly.

THE KEWANEE BOILER COMPANY, 96 Lake street, Chicago, are to move to more commodious quarters at 54 Dearborn street, where they have secured the entire first floor, and will have ample space for the display of a full line of Haxton boilers and Tabasco hot water heaters.

After an interval of comparative quiet the Latin-American portion of this continent has once more relapsed into what seems to be its normal condition of revolution and unrest. Discord between contending factions in Peru has resulted in bloody hostilities at Lima, followed by the establishment of a provisional government consisting of representatives of both parties, a condition of things which cannot long exist. War is threatened between Chili and Argentina, in which Bolivia and Ecuador may be involved. An uprising in opposition to the existing government is reported in Salvador; Venezuela is more or less embroiled with some of the European powers, and the island of Cuba is the scene of a serious revolution, which has paralyzed trade in that country.

United States Consul Germain, at Zurich, is of the opinion that there is an opening for the introduction into Switzerland of American wood working machinery and tools. He writes that if a good agent, speaking French and German, were sent out to visit Swiss manufacturers he would be able to secure large orders. He also thinks that American manufacturers in these lines might find a good market in Germany, England, France, Austria, Hungary and Italy.

Judge Lacombe, in the United States Circuit Court, New York, dissolved last week five injunctions, issued on July 7, 1893, restraining a number of electric light and illuminating companies from infringing a patent for an improvement in electric lights granted to Thomas A. Edison, and controlled by the Edison Electric Light Company and the Edison Electric Illuminating Company of New York. The injunctions were dissolved on the ground that a prior patent, issued to Edison in Canada on November 17, 1879 for 15 years, has expired.

ROOFING AND CORNICE.

Tower Work in Copper.

BY W. N.

The front elevation, section and ground plan printed in Fig. 1 show the copper work of a tower which was recently executed of 16 ounce cold rolled copper. By referring to the front elevation and section, and to Figs. 2 and 3, it will be seen that the foundation of the copper work is terra cotta. Of particular interest are the methods of fastening the copper work at the building, and for this reason the details of construction have been prepared. T C in Fig. 2 represents the terra cotta cornice, which is L-shaped at the top, as shown at S. Over this L-shaped terra cotta the flashing A is formed, as shown in Fig. 2, and prevents the water from getting inside of the building. This flashing A is placed around the entire tower, the corners and cross seams being soldered water tight. It will be noticed that the flashing extends down the inside, as shown at S, and is slightly bent downward, as shown at B. The corners and cross seams being soldered, no other fastenings are required, as the flashing is bent so as to spring tightly over the terra cotta. The columns shown on the front elevation were then set, and fastened at the bottom by soldering to the copper flashing at the bottom, and fastened at the top by screwing to the wooden brackets which are bolted to the T-irons shown on the ground plan, Fig. 1. The cornice shown on front elevation was then set over the columns and secured by means of copper wire and bands to the iron frame work of the tower. The next step was the setting of the circular windows shown on the front elevation, which, as will be noticed, are inclosed in a square panel. Fig. 3 shows the method of fastening these windows, which is as follows: A represents the terra cotta, B the flashing over the terra cotta and L the drip which is formed to the bottom of the windows and soldered to the flashing B at D. The flange C in Fig. 3 extends around the other three sides of the window, and with copper rivets is riveted to the flange of the columns and cornice. All braces are fastened by means of brass bolts and copper rivets. After all this work was completed the roof was covered with Spanish tile, which were nailed to the porous terra cotta blocks. Over these tiles the copper flag pole base was set, as will be noticed by referring to the front elevation. The lower part of the base is square, the middle part a transition from square to octagon, and the upper part round. V, in Fig. 4, shows a sectional view of the flag pole, and also shows the method of obtaining a water tight joint at the top. V represents the circular molding placed around the top, with a space of 1 to 2 inches from the top of the molding A to the side of the pole. This space is allowed so that in stormy weather, when the pole begins to sway, it will not injure the molding or cause leaks. The funnel or collar B is placed over this molding, the collar having a space of 1 to 2 inches around the top

of the molding A, and is nailed closely in white lead against the pole. To be perfectly sure of a water tight joint, another collar, shown at C, is placed

catch the snow when blowing under. This method of construction around the flag pole also gives ventilation under the tower roof, as shown by the arrows

Tower Work in Copper.—Fig. 1.—Elevation, Plan and Section.

over the funnel B, leaving a space between the two funnels, and is nailed in white lead to the flag pole. A hook edge is bent at A as shown, so as to

in Fig. 4. In many cases where the molding A, Fig. 4, was nailed direct to the flag pole, it has been broken when the flag pole began to sway, causing

leaks; and it is an expensive matter to stop leaks in such a place, owing to the difficulty of reaching the pole.

Slate for Roofing.

In an interesting article discussing the various forms of roof coverings employed since the early history of the

Fair Haven, Vt., in 1839, at Scotch Hill. He manufactured school slabs extensively; in 1847 he commenced the making of roofing slate, and in 1848 he abandoned the school slate trade in favor of that of roofing slate.

The first roof covered with Vermont slate was done by Col. Allanson Allen in 1848, and under these conditions: He was to wait one year for his pay,

In any of the old churchyards can be found gravestones, anywhere from one to 1400 years old, made of slate, and some of the letters seem to keep as fine an edge as when first cut. Then, summing up still further, slate is fire proof, and vegetable matter does not easily attach itself, and hence all water running off it is, as far as the slate is concerned, chemically clean, is free from offensive, smell of decayed wood or moss, as is the case with wooden roofs when old. It requires no paint to keep it water proof as does iron, tin or felt. In truth it is a roof that protects without a constant and continual outlay of money to keep it so that it will protect.

The Roofer.

It is a little too early yet for the roofer to be busy on new buildings, but the time until they are ready should not be wasted. The winter always puts a strain on tin roofs and gutters, with its freezing temperature at night and the heat to which the roof is subjected by the noonday sun. Then the ice in the valleys, gutters and leaders is apt to leave them in a condition for repairs. The paint on a roof is liable to crack or scale from the winter strains, and a fresh coat is the only safeguard against rust and ruin. The roofer knows this, but unless he brings it to the notice of the property owners in his locality it will profit him little. He had better make an inspection of the condition of the roofs of his neighbors and furnish a report free than to sit idle waiting for something to turn up. This will give him an opportunity to talk about the quality of roofing and to impress his hearers with the difference between low priced and good roofing. The starvation price of roofing is the complaint of roofers all through the country, and will be until the roofer has talked good roofing in a way that will let the layman understand the great difference that a cent or two will make in the quality of the material used and the durability of the roof.

This is a good season for some missionary work, and if samples of tin of good size and various qualities are carried along with paper between to prevent rubbing they will lend interest to the conversation. There is a vast difference in the quality of roof paints used, and if some of the tin samples are painted with different grades of paint some benefit will be derived. A set of such samples kept at the shop neatly arranged with tissue paper between them and wrapped in a neat paper will impress the customer that there really is something more in tin and painting than the price, which has too long been the prominent feature of roof talk. Some men spend a good many spare hours and odd minutes in getting just the right wording for a postal card or a small circular which at this season they send to those who own roofs or will be buyers in the future. Roofing well done is not the common labor that its price would

Fig. 2.—Copper Flashing Over Terra Cotta.

world, G. B. Benford presents in a late issue of *Stone* some remarks on slate which are worthy of repetition in this

and if in the mean time the roof should break down from the weight of slate he was to receive no pay, but should pay all damages. The farmer was disappointed, and the roof is good to-day.

A few words in reference to the color of a slate roof may be of some use to those who have not heretofore taken that into consideration when painting their house. When one has a great body of a decided color on a roof, as green, purple, or red is, they should carefully select some shade that will harmonize generally with their roof. That is the reason that some green slate looks brighter, some purple richer and some red more lively, because either knowingly or unknowingly there has been a judicious harmony carried out, by a correct juxtaposition of color. On the other hand a man may paint his house with precisely the same colors as his neighbor, but there is a something about it that he does not understand; it does not look so well as neighbor Brown's. Let him look at his roof. Five times out of six the roof kills the job. Not because anything is amiss in the roof itself, but because of the want of a little artistic taste in color harmony. Neighbor Brown's house was the right color to match the slate. I have just called attention to this because it is one of the peculiarities I have noticed.

A slate roof lends itself very easily to decoration. I have seen mosaic borders and bands of parti-colored slate which were artistic and striking as a method of advertising. No large firm who have an extensive run of slate roofs should fail to put in their name and trade in lighter colored slates than the body of the roof. It stands as long as the roof, because it is a part of it. No iron or wooden signs to blow down, no paint to wash off, an imperishable signboard. Hence to sum up, a slate roof combines the greatest strength with the greatest endurance; slate if good and put on well lasts longer than the proverbial lifetime. The writer knows of a roof that was slated about the year 1680 in one of the royal dockyards of England. About 25 years ago it was found necessary to pull down the building and build a larger one. The greater portion of these slates were placed on the new building. It was also remarked at the time that very little repairs had been done on the roof during the nearly 200 years it had stood.

Fig. 3.—Method of Fastening Circular Windows at Bottom.

connection. Among other things he says:

The first slate used in this country, undoubtedly, was brought over from Europe, although it was known that

Fig. 4.—Section Showing Water Tight Joint at Flag Pole.

slate could be found in this section of the country, yet it was a long while before any person began to make any use of it. The first quarry had been opened for nearly eight years before any roofing slate was manufactured.

The first quarry in the neighborhood was opened by Col. Allanson Allen of

often suggest, but is a work in which skill and judgment are required, and some effort should be made to raise the

Sheet Metal Ornaments.

We show in the accompanying illustrations specimens of sheet metal work

ladder is made of Canada spruce with oak rounds, and is said to weigh $1\frac{1}{2}$ to $2\frac{1}{2}$ pounds per running foot, and is made

Sheet Metal Ornaments.—Fig. 1.—Leaf Ornament.

Fig. 2.—Bracket.

Fig. 3.—Ornamental Sheet.

value of good work in the estimation of the buyer and thus lead to its being made more profitable.

made by James White of Brooklyn, N. Y. The examples are taken at random from the extensive assortment manufactured and serve to illustrate some of the work that he does. The leaf ornament, Fig. 1, is deeply stamped and measures $16 \times 16 \times 27$ inches, and the bracket shown in Fig. 2 measures $16 \times 25 \times 8$ inch face. The ornamental sheets of which a section is presented in Fig. 3 are 16 inches wide, while Fig. 4 shows an ornament $16 \times 19 \times \frac{3}{4}$ inches in size. The claim made by Mr. White for this work is that all the designs are original, everything having been carefully modeled by his own artists, being made for some specific purpose and afterward put in stock. Mr. White has also given great care to the manufacture of his cornice trimmings with a view of producing a high grade of stamped work. All the ornaments, of which a very extensive collection is shown in his catalogue, are carried in stock in zinc and are made to order in copper, brass and other metals.

FLASHINGS.

THE OLD JONES BELL FOUNDRY at Troy, N. Y., has been leased by W. H. Squarey and Dr. Billinger of Elizabeth, N. J., who will, it is reported, use it as a plant for the manufacture of tarred roofing paper.

ALLEN ACKERLY & Co., 171 Vine street, Cincinnati, Ohio, send out circulars calling attention to the "everlasting staying qualities" of their Anti-Rust Japans. One of the testimonial letters is a *fac-simile* letter from the War Department speaking in the highest terms of the Anti-Rust Japans, which have been applied on all the metal roofs of the extensive buildings at Fort Thomas military post. Another testimonial is from a brewery engineer who heartily indorses the material.

WATSON H. BLISS & SONS, Hartford, Conn., are manufacturing the Hill extension ladder in New England. The

in lengths from 16 to 50 feet. The extension part runs inside of the ground section and can be readily separated, making two ladders when desired.

WE LEARN from W. J. Burton & Co., Detroit, Mich., that they are enjoying an improved trade in their metal shingles and tools. During the past ten days they have made shipments of their East-lake shingles to Chicago, Toledo, Columbus, Texas, California and various points in Michigan. They also are

Fig. 4.—Stamped Ornament.

having a better business in gutters and conductors.

SCHWING & FRISWELL, Bridgeport, Conn., have completed their large contract at Bedford, N. Y., and also a galvanized iron cornice for the Southport Savings Bank. They have also commenced work on the cornices and bay windows on the Atlantic Hotel.

GLOVER SANFORD'S SONS, Bridgeport, Conn., are raising their store building one story and will cover the front with galvanized iron in imitation of stone.

THE UNITED SALT COMPANY, Cleveland, are just completing the rebuilding and enlarging of their works since their fire. They have a very extensive and complete plant. Their buildings are fire proof, frames and covering being entirely of iron. The Garry Iron & Steel Roofing Company of Cleveland furnished the material and erected the entire plant.

JAMES WHITE, 446-456 Adelphi street, Brooklyn, N. Y., has published a catalogue of sheet metal architectural ornaments in zinc and copper, which is a publication that will be of much interest to the roofing and cornice trades and all those who make use of sheet metal ornaments. The publication is in the form of a portfolio, bound in heavy manilla paper, tied at the back with a string and measures 9½ x 6 inches. Altogether there are 80 odd pages in the book, the sheets being of heavy paper and printed on one side only, giving the whole a very handsome appearance. The publication is not encumbered with unnecessary letter press, the only thing being an announcement at the beginning of terms, discounts, &c. The illustrations cover a most extensive variety of handsome work and will be much appreciated by the trade. Accompanying each cut is a number for ordering and particulars of size and price. In addition to the architectural ornaments there are given at the end illustrations of sheet metal pipes, skylight bars, flashings, skylights, fireproof doors and shutters, ash chutes, &c., while the last page carries an alphabetical index of the contents.

THE KANSAS CITY METAL ROOFING & CORRUGATING COMPANY, Kansas City, Mo., have moved from the Builders' and Traders' Exchange to 416 Delaware street, where they have greatly enlarged facilities for handling their steadily increasing business. The building is well adapted to their business, and they will carry full and complete stocks of all goods handled by them.

WE HAVE RECEIVED a circular from P. H. Lauffman & Co., Limited, Apollo, Pa., referring to their well known specialty, Lauffman's Apollo terne, or leaded sheets, in large sizes, adapted for car roofing, cave troughs, conductor pipe and cornice work. These sheets are made 20 to 36 inches wide and 60 to 120 inches long and from No. 17 to No. 30 gauge. Attention is called to the fact that the sheets are made by oil process and not with acid flux.

BELL'S GALVANIZED WIRE HANG TROUGH HANGERS, which have been on the market for some ten years, are still growing in favor with the trade. The hanger is made of one piece of heavy steel wire galvanized and is so formed as to be a brace and support to the trough and keep it in shape as well as in place. It is constructed so as to admit of its being placed on the trough and fastened, and the trough hung very quickly and with the expense of the least time and labor. The manufacturers refer to their convenience in shipping, being neatly bunched. The hangers are sold chiefly through jobbers, but samples will be sent by applying to the manufacturers, John W. Eell & Co., Mercer, Pa.

GARA, MCGINLEY & Co., 23 South Seventeenth street, Philadelphia, Pa., send out memorandum pads reminding the trade of their business as roof repairers. At the top of each sheet is an original observation or quotation respecting their business. The back car-

ries a request to "Stick this on your 'phone," and the glue, by which the sticking is done, is all ready for moistening.

HEATING & PLUMBING.

NEW WORK AND CONTRACTS.

JAMES E. CAMP of Bridgeport, Conn., is building a fine residence which will have a plumbing system and will be heated by hot water.

M. J. DALY, Waterbury, Conn., has just taken a large contract in New Haven for the Winchester Repeating Arms Company to construct a fire hydrant system, 1100 feet long, of 8 inch cast iron pipe.

ASHTON & GARRITY, Waterbury, Conn., have the contract for the plumbing in the new residence of Rev. J. H. Duggan.

THE GRISWOLD, RICHMOND & GLOCK COMPANY, Meiden, Conn., are finishing up their big contract for placing the indirect steam heating pipes in the Old People's Home. The contract is a very large one, involving the working up of more than 20,000 pounds of galvanized iron.

GEO. L. MCQUIGG, Flint, Mich., has closed a contract with Father Murphy for a hot water heating system for his residence; also for a hot and cold water plumbing system.

THE Board of Public Works of La Crosse, Wis., will advertise for proposals for heating and ventilating the new school buildings on the plans and specifications of the Sturtevant Company.

THE Board of Supervisors of the Almshouse at Canton, N. Y., are about to expend \$1500 for some system of heating and ventilation to be selected.

THE contract for plumbing the new Merrill Block has been let to Bovett & Noble, Pittsfield, Mass.

CLARK ELLIS & SONS, Milford, Mass., have been awarded the contract for the plumbing at the new school building.

KRUSE & DEWENTER, Indianapolis, Ind., have been awarded the contract to furnish the heating and ventilating apparatus for the new medical college in that city, and for the High School Building in Pendleton.

POSTMASTER DAYTON has received word that the contract for reconstructing the entire plumbing of the New York City Post Office was awarded to Blackburn & DeGraw of New York, the lowest bidders, at \$28,500. The work is to be completed in 90 days from the signing of the formal contract, which will be about April 3, and about April 15 advertisements will be published for arranging the ventilating system of the Post Office.

R. J. O'CROWLEY, Newark, N. J., is doing the plumbing in a house for D. A. Robinson.

THE heating and ventilating apparatus for the new school house at Milford, Mass., will be supplied by the Fuller-Warren Company, Troy, N. Y.

BARLOW BROS., Waterbury, Conn., have commenced work putting in the heating apparatus, which will be run by steam, in the new town hall at Water-town.

CROOK, HORNER & Co. of Baltimore, Md., have been awarded the contract for furnishing the steam heating and power plant for McMahon Hall of the Catholic University at Washington.

J. H. COGAN & Co., Augusta, Maine, have just taken the contract to furnish the residence of Hon. J. H. Manley, Hospital street, with one of the Richmond steam heating systems.

THE CONTRACT for plumbing the new block to be erected by Edison J. Hill, on Hill's avenue, together with contracts for gas piping and steam heat, have been awarded to Lee Bros., Concord, N. H.

BIDS will be received at the Board of Education at 713 Filbert street, Philadelphia, until April 2, for a new boiler in the Mt. Vernon street school, alterations and additions to heating Adamson and Fairview schools, also for heating and ventilating the Curtin school, the addition to the Fair Hill school, the Diston school, and the school at Forty-sixth street, and Woodland avenue.

THE DEPARTMENT OF PUBLIC INSTRUCTION, Brooklyn, N. Y., will receive proposals at the secretary's office, 131 Livingston street, until April 2, for heating and ventilating the new school No. 108. Plans and specifications may be obtained at the office of the chief engineer in Red Hook lane. Bids will be received for steam and the combination of steam and hot water separately.

SEALED PROPOSALS will be received by Howard School Board until noon April 17, 1895, for a system of heating and ventilating Park school, Ligonier street, Sixteenth Ward, Pittsburgh, and old buildings of Bloomfield school, Ella street, Sixteenth Ward. All bids should be addressed to John H. Rhine, Secretary, 317 Edmund street, Pittsburgh, Pa.

JAMES BIRNEY, 2002 West Madison street, Chicago, has the contract for the plumbing and drainage in the flat building of Alfred Halmberg, on Marvin avenue.

HARRIS BROS., 3239 State street, Chicago, are to do the plumbing and drainage in the flat building of John M. Gartside, 4327 Drexel boulevard.

JACOB KIENSLING, 1199 Milwaukee avenue, Chicago, has contracts for the plumbing and drainage in the flat buildings of L. Ludke, 726 Dudley street, and H. R. ether, 699 Davis street.

THOMAS WIXTED, 5553 South Halsted street, Chicago, has the contract for the plumbing and drainage in the residence of J. Elben, 5614 Carpenter street.

TAFFE & LEIBRANDT, 3025 State street, Chicago, have the contract for the plumbing and drainage in the flat building of Charles Leibrandt, 5313 Indiana avenue.

HANLEY & CASSEY, 21 Quincy street, Chicago, have the contract for the plumbing and drainage in the flat building of A. S. Bradley, 5453 Monroe avenue.

PETERS BROS., 1726 North Clark street, Chicago, have the contract for the plumbing and drainage in the flat building of A. Lemmert, 221 Baxter street, Lake View.

GEORGE HAUSLEIN, 1179 North Halsted street, Chicago, is to do the plumbing and drainage in the store and flat building of E. Behm, 805 Clybourn avenue, and in the flat building of E. C. Yerton, 964 Perry street.

CHARLES P. MARTIN, 6406 LaSalle street, Chicago, is to do the plumbing and drainage in the flat building of M. Larson, 6353 Morgan street.

THE RETAIL STORE.

New Jewel Gas Stoves.

George M. Clark & Co. of 149-161 Superior street, Chicago, Ill., have added to their already extensive assortment of gas burning appliances for heating and cooking purposes a new line of Jewel gas ranges. At present

is first class throughout. Another novelty which the company have this season added to their assortment is shown in Fig. 2. This is the Jewel laundry stove of a hight just right for a wash boiler, the top being large and furnished with three removable solid lids. The heat is furnished from three No. 10

side heating attachments. The company refer to these stoves as being useful for many other than laundry purposes. They have also brought out a new line of Junior stoves made in three styles and with six different arrangements of burners, one of which is shown in Fig. 3 of the cuts. These are offered under the name Jewel and are 22 inches wide by 22½ inches deep and 5 inches high.

New Jewel Gas Stoves.—Fig. 1.—Gas Range No. 363.

two styles are being manufactured, one of which is intended for using natural gas and the other for artificial gas. The latter style is known as No. 363, and is represented in general view in Fig. 1 of the accompanying illustrations. It has four burners in the top surface, two lids over the water back and a griddle cake baking plate with reversible burner.

burners directly under the lids referred to. Upon each side is constructed an iron heating device having a No. 10 burner inclosed, these burners being lighted with a pilot light. The flame of the iron heating burners plays against

Fig. 2.—Jewel Laundry Stove with Iron Heating Devices.

There is also a broiling chamber, a baking oven and a roasting oven, the base of the latter being made removable. The decorative features are of an effective character and the construction

the slanting top of the plate, giving, it is said, very satisfactory results in operation. Each side has a capacity for three irons, the ledge at the base which holds the irons having openings to receive the points of Mrs. Potts' and similar irons. The Jewel laundry stove is constructed of cast iron throughout, has a top surface 24½ x 18½ inches, a top opening 18 inches wide by 12 inches deep, and an iron heating plate 13½ inches wide by 9½ inches high. The extreme width of the stove shown in Fig. 2, including the iron heating wings, is 29 inches. The manufacturers furnish one style of this stove without the

Guardian Fire Extinguisher.

The accompanying cuts represent a fire extinguisher being put on the market by Randolph & Clowes, Water-

Fig. 1.—Guardian Fire Extinguisher.

bury, Conn. The vessel in which the fluid is held under pressure is a seamless copper shell, in sizes to suit, from 2 to 5 gallons. One of the special features in the extinguisher is the two separate and distinct methods of operation. One of these is an air pressure, which, it is stated, is automatic. The

Fig. 3.—Jewel Junior Stove No. 237.

other, it is stated, is a never failing pump, which is auto-mechanical. If from any cause the air pressure should fail to throw the fluid, the pump can be called into use. The discharge pipe or tube, to which the hose is attached, and through which the fluid must pass, is a single, double acting piston pump, of the water packed piston type. It is explained that the mechanism of the pump is such that when the piston or handle of the pump is turned to release the pressure the same movement turns the receiving valve upon its seat once and a half around, so no time is lost. If the internal pressure of the

compressed air is weak, or lost altogether, the necessary force is added by working the piston up and down a stroke of from 6 to 8 inches. The pump immediately fills and force is supplied, it is remarked, to throw a solid stream 40 feet. The pump is so constructed that the receiving valve is kept closed during any period of idleness. It is explained that, while the extinguisher stands ready charged for immediate action, the pump remains perfectly dry, and that should the extinguisher be subjected to a temperature cold enough to freeze the contents of the vessel, the pump will be found in working order, as there is nothing in it to freeze. The point is made that all important mechanical parts of the extinguisher are so arranged that they do not come in contact with the fluid until the extinguisher is in operation; that the tank is so arranged that the compressed air is kept away from the fluid connection by casing it in a compartment by itself, and that the air pressure does not come in contact with any connection of the extinguisher. The manufacturers state that the fluid for extinguishing fires is a combination of chemicals furnished them by one of the most celebrated chemists of the country, that it will not deteriorate or become useless with age, that it will not corrode metal or stain the finest fabric, where the colors are

Fig. 2.—Guardian Fire Extinguisher with Gauge.

not fugitive, that the extinguishing qualities are exceptional and that by actual test it has stood a temperature of zero without freezing. The manufacturers furnish the compound in packages, securely packed for shipping, with directions for mixing it. A reliable pressure pump that will not rust or corrode is also furnished. The manufacturers claim that by repeated and expensive experiments they have produced a thoroughly practical and reliable fire extinguisher.

The Wolff Cooker.

A new candidate for favor with dealers in summer goods is the Wolff Cooker, made by the Wolff Gas Radiator Mfg. Company, 164 Franklin street, New York, and which is shown in the accompanying picture. The cooker is new in design and construction, being light in weight so that it may be easily transported, and is compact, so that it is capable of doing a great deal of work and occupying but a small space. There are three burners that may be used for cooking on the top, two for cooking

exclusively on the top, and the third for broiling in the oven as well as cooking on top. This is a new application, and the construction is novel. The top of the range is well perforated to permit the heat of the turners passing up around all vessels which are set upon it, and is so constructed that vessels may be moved around upon it without lifting up. The broiler burner is placed under the center cooking hole and is of an oblong ring construction, the gas burning only on the inner side and under the fine fret work casting, which has projecting pins on the under side.

The Wolff Cooker.

This casting is heated red hot and radiates heat against the food to be cooked. On dropping down the oven door a rack is seen, which is placed in the upper part of the oven on which the broiler sits. Another burner of the same character as the cooking burners on the top of the stove is placed under the center of the oven, and it is said that the cooker is an excellent baker. The oven is 10½ x 16 inches and 10 inches in height. The cooking burners and the burner under the oven are rated to burn 10 feet of gas per hour, the broiler burner burning 12 feet. All the burners are provided with an adjustable air mixer to meet the requirements of gas of different qualities and furnished at different pressures. The castings of the stove are of a fine finish and the body is constructed of Russia iron. All the castings on the front of the stove and the name plate are nickel plated, giving the stove a very attractive appearance.

MEMORANDA.

JEAN L. REED, representing the Rochester Stamping Works and the Robeson Cutlery Company, 141-147 Jones street, Rochester, N. Y., uses a black card, printed in gilt, bearing five verses of praise to the "Rochesters," referring to their line of goods. The card also bears a cut of a copper tea kettle, and allusion is made in the poetry to the many different household goods made of sheet metal by the firm.

IT IS NO UNCOMMON THING for stove dealers to receive curiously worded orders through the mail, but occasionally one is received of such a unique character as to make it more than ordinarily conspicuous. A stove firm doing business in one of the smaller towns in

Maine recently had brought into their office by an out of town stage driver an order reading as follows: "ples geet me A wash bolar Ass cheep Ass you Can A bout 100 25 ore 100 50."

E. M. LAW of West Newton has bought A. H. Lyman's stove store, at Athol, Mass., and will continue the old business and add plumbing. He was formerly in Mr. Lyman's employ.

FRED D. HARRIS and his brother Edward H. Harris have formed a co-partnership and will conduct a tin and repair shop on West Elm street, Oneida,

N. Y. Edward H. Harris has been in the employ of Conley Brothers at their stove store on Madison street. The firm will make a specialty of furnace work.

A. P. BATEMAN, Winchester, Mass., continues to make improvements to the front of his tin shop store. He has built two large show windows.

THE BEARDSLEY MFG COMPANY, Cleveland, Ohio, distribute blotters advertising some of their specialties, which include fire shovels, Economic roasters, grain measures, flour measures, cans, tanks, kegs, &c. Several of the goods are illustrated on the blotters.

HORTON, GILMORE, McWILLIAMS & Co., 172 to 176 Lake street, Chicago, have been appointed exclusive Chicago agents for the Meyers Putz Cream Liquid Metal Polish and the Putz Extract for polishing. These preparations have a worldwide reputation. The first named is not only designed for metals, but also for wood work and leather. The other is for all kinds of metals except silver ware.

L. & I. J. WHITE, Buffalo, N. Y., have opened an office at 48 Centre street, New York, in charge of S. J. White. One of the walls of the office is decorated with a display of edge tools that was exhibited at the Paris Exposition; and the sign that was used over their exhibit is also an attraction in the office. Against a black cloth background in an oak frame of shield design edge tools of various descriptions are shown. They include ice axes, firmer and socket chisels and gouges, draw knives, butchers' cleavers and knives and ship carpenters' tools. Another piece of work on exhibition is a leather splitting knife blade 92 inches long, of superior cast steel and sharpened to a razor edge.

STOVE TRADE NOTES.

The Stove Secretaryship.

The leading members of the stove trade who take an active interest in the affairs of the National Association of Stove Manufacturers are realizing more strongly from day to day the loss sustained in the death of D. M. Thomas, the late secretary. His peculiar fitness for the position was, of course, recognized by the great majority of the members, as shown by the very cordial support which they gave him. Yet Mr. Thomas' warmest supporters now acknowledge that even they fell short of measuring him at his true worth. The best evidence of his superior qualifications is the fact that so far no candidate for the succession has been brought forward who commands any considerable following. Names have been mentioned in connection with the place, but thus far there has been no crystallization of sentiment in favor of any of them. Available men who can satisfactorily fill the position of secretary of the National Association may be found without a very prolonged search, but the great difficulty encountered is in getting a man who can at the same time take up the extremely important work of the Stove Founders' National Defense Association. The two associations are not identical, although largely composed of the same individuals. For special reasons it is desirable that the same person should serve as secretary of both associations. In the case of Mr. Thomas there was no thought of separating the work. He thoroughly comprehended the functions and the special fields of labor of both organizations, and to be elected secretary of one meant for him the secretaryship of the other.

In the discussions and correspondence upon this subject which have so far taken place among the leading members, several names have been suggested of persons who would admirably fill the position of secretary of the National Association. They possess the literary qualifications desirable for the incumbent of this office, and some of them have such attainments of a very high order, which would make them in this respect worthy successors of the deceased secretary. They are also familiar with the commercial side of the stove business, and would by their originality and great mental force assist materially in making the annual conventions interesting and instructive. They would be able to extend the membership of the organization by the persuasive powers with which they are gifted, and their tact would soften an-

tagonisms and prevent misunderstandings. But, thus far, no one in a position to accept the secretaryship has been brought forward who combines with all these qualifications the practical knowledge of stove molding which he must possess in order to successfully conduct the work of the Defense Association.

This part of the secretary's work calls for very peculiar qualifications. The right man in this position can render inestimable service to the stove trade in arranging differences between manufacturers and their workmen, so that serious strikes are prevented. It is true that the other officers of the Defense Association are practical men, who are versed in all the technicalities of stove molding, and are therefore competent to adjust differences that may arise. They by no means abdicate their power in favor of the secretary and relegate to him all their functions. But they have their own business to manage, and cannot travel at a moment's notice to a distant town to hear the fine points of a controversy over the piece price to be allowed a molder for turning out some new shape of a stove part. This is the function of the secretary, and when he appears on the ground he must be so competent to judge the value of the work, and so able to prove the justice of his position, that his fairness will commend itself to both the contending parties. This involves not only the knowledge that comes of years of experience in running a molding shop, but also much hard study in becoming familiar with all classes of work, all varieties of stoves and the peculiarities of the several sections of the country. It is not every manufacturer who can dissect a range made near him with a similar one made 1000 miles away, and fix a fair molding price on every piece of the latter in compliance with all usages which have grown into the trade in the section in which the second range is being turned out. But it would be well if the secretary could do so. He would be a tower of strength to the manufacturers, as he would surely gain the respect and admiration of the workmen, who are intensely jealous of their rights, but are usually quick to acknowledge the justice of a perfectly fair proposition.

The task of selecting a secretary is thus shown to be extremely difficult. Yet the qualifications are not rare in the stove trade. Quite a number of men could be designated any one of whom would make a very capable secretary.

But they are not available, being so situated that the office has no attraction for them. The problem is to find an available man with the necessary qualifications. As the time for the annual convention is approaching this is a question of very great interest to the stove trade, and therefore one which many of our readers would be pleased to have an opportunity to discuss. They may have candidates whose names they desire to bring to the notice of the trade. We shall be glad to print communications on this subject.

Foundry Mixtures for Stove Castings.

The following interesting letter discussing the question of foundry mixtures that appeared in *The Metal Worker* March 16 is sent us by C. A. Meissner of Birmingham, Ala.:

I note a letter in a recent issue in which a foundry manager complains of a certain mixture as not having given good results. He says this mixture was:

30 per cent. No. 2 Foundry, Southern pig.
38 per cent. No. 3 Foundry, Southern pig.
16 per cent. No. 1 Soft, Southern pig.
7 per cent. Jackson County Silvery, 5 per cent. silicon.

With this he used his own scrap, also 30 pounds limestone per charge. He states resultant iron is very dirty and "rusty," that it cannot be skimmed clean, that the rust gets into the molds and makes mean looking castings, and asks opinions of others as to what is the trouble and how to overcome it.

Would you pardon me if I make a little good natured criticism? Our foundry friends make it often a very difficult task for the furnacemen and chemists to help them out of their troubles, from the fact that so often they forget to give them the very data which are absolutely essential to a study of the difficulty. We have here the percentages given, and that is all. There is no intimation as to what section this Southern iron comes from—Virginia, Tennessee or Alabama—which might be a guide to the nature of the iron. There is no analysis of the iron given except the Jackson County, without which we can hardly reach an intelligent conclusion, and he does not state the amount of scrap used nor the nature of the coke, both of which are important items. I do not want to find fault in any way, but merely call the attention of our foundry friends to the need of being a trifle more specific when such matters come up, and I am sure there are plenty of men all over the iron districts who can very quickly give them a clear idea of where the trouble is to be looked for.

As I am reasonably familiar with Southern and Northern irons, permit me to make a rough guess at his trouble and give my reasons for it. I think his mixture is too soft, too high in silicon and probably too high in phosphorus. Every iron he has there is liable to be a high silicon iron, as almost all South-

ern coke irons, except from the brown ore fields, tend to be soft and fluid rather than strong, and even those of the brown ore districts share this property to a large extent.

Take the average Southern iron and analysis will be about as follows:

	Per cent.
No. 2 Foundry, silicon.....	3.25 to 2.60
No. 3 Foundry, silicon.....	3.20 to 3.400
No. 1 Soft, silicon.....	3.75 to 3.75
Phosphorus will average from	0.450 to 0.700

The Jackson County iron will probably run 1 per cent. in phosphorus.

To this he adds his own scrap, which, if made from repeated charges of this mixture, will naturally be high in silicon and phosphorus, and he apparently has no strengthener whatever in his mixture. Of course some of his Southern iron may be a low silicon and phosphorus brown ore iron, in which case the above does not hold altogether good; but even then I should say that he had no need for the Jackson County Silvery, in so far as his Southern No. 1 Soft would be bound to take care of any other Southern iron he could get and give necessary softness and fluidity. Therefore my judgment would be that for his purpose, stoves, he should leave off the Silvery iron and try the mixture without it. If he uses no strong Southern brand—but they are all high silicon and high phosphorus—he could readily buy a strong Southern iron from any of the Southern companies by specifying his needs, for all of them are now going into the matter of analysis most earnestly and are able to meet any such demand, as they all carry strong iron as well as soft iron in their yards.

It may be interesting to note the probable average of this mixture in silicon and phosphorus, based on actual averages of Birmingham iron:

	Silicon. Per cent.	Phosphorus. Per cent.
39 per cent. No. 2 Foundry.....	2.40	0.550
38 per cent. No. 3 Foundry.....	2.25	0.550
16 per cent. No. 1 Soft.....	3.25	0.550
7 per cent. Jackson County Silvery.....	8.00	1.00

This would give a mixture of 2.87 per cent. silicon and 0.581 per cent. phosphorus, which with probably high silicon and phosphorus scrap would be liable to make a mixture entirely too rich for his use and cause his troubles.

From HENRY HEYER, Capital City Sove Works, Columbus, Ohio—In my opinion, the correspondent who wrote *The Metal Worker* March 16 asking for information about foundry mixtures is using too much limestone. I use only from 6 to 10 pounds per ton of iron as a flux and with good results. I use only Frick's coke. I have used several kinds of coke, but find that is the best in the long run. I would furthermore suggest to your correspondent to cut the No. 3 Southern 18 to 20 per cent., and add this 18 to 20 per cent. to No. 2 Southern. I do not put much faith in No. 3 Southern foundry iron for stove plate, although some may have had good results with it. If these suggestions do not help your correspondent I will be glad to give him my mixture if he will apply for it.

A Pennsylvania correspondent, noticing the article on foundry mixtures for stove castings in *The Metal Worker* of March 16, says: "It is difficult to comply with the request made, as there is but little ground to work on. It is

evident that some iron that should not be used is in the mixture, and the proper thing to do would be to get a chemical analysis of each iron used. There are Southern irons which in the pig look first class in every respect, but when used look similar to silver gray and have given our foundrymen considerable trouble. The usual method of getting over the trouble is to drop the iron which causes it out of the mixture altogether. There is no reason why any silver gray iron should be used if the other irons are all right. There is no trouble whatever in getting a first-rate mixture for stove plates with three irons, and a mixture that will run soft, strong and fluid. Such a mixture can be secured with only 3 per cent. of silicon instead of 8 per cent."

A Furnace Association Needed.

Chicago furnacemen state that the furnace trade of that city is in a deplorable condition. Manufacturers and representatives of other manufacturers have been waging relentless war upon each other until prices have been so seriously cut that ruin seems to be inevitable if a change is not speedily made. The prices at which heating contracts have been recently taken are so absurdly low that they almost challenge one's credibility. It would perhaps unduly demoralize business in other sections to quote them. It is enough to say that the whole work of installing a furnace system in an eight-room house is now done for the price of the furnace alone two years since. It is by no means unusual for a conscientious furnaceman to find that the competitor who captured a job was from 20 to 33½ per cent. cheaper. The difference is so great that arguments as to character of work, efficiency of apparatus, safety from fire, &c., have little weight in influencing owners to reject the lowest bidders and take one of the dearer ones.

It follows as a matter of course that these very low prices mean inferior work. The furnaces cannot be properly made, the roughing-in cannot be done with the necessary precautions against danger from fire and all the work must be done hastily and in the most slighting manner. Reductions in cost of material have been considerable within two years, it is true, but they have by no means been so great as to cause the difference prevailing between prices now and then. Furnacemen who expect to do good work confess their utter inability to meet the conditions existing round them. They are of the opinion that the only remedy for this state of affairs is the formation of an association of the manufacturers and manufacturers' representatives in and about Chicago to maintain fair and equitable rates on their furnaces and to control, as far as they can, the reckless bidding on contracts.

It is to the interest of furnace manufacturers to discourage these extremely low prices and not to countenance them by making special concessions at the

solicitation of those contractors who can only secure jobs when they are lower than any one else. It is no credit to a manufacturer to have his name on a furnace forming part of a poor heating system, because the first part of a heating job to be attacked when it fails to give satisfaction is the furnace. A few furnaces of a particular make thrown out in one neighborhood may mean the loss of all patronage in that locality for many years.

An organization of furnacemen would undoubtedly be found of much benefit in correcting disturbances of this character, because men cannot get together and talk over business matters without making an impression on each other in the direction of greater consideration and fairer treatment. Perhaps in no other branch of business to-day is there such a total lack of intercourse and complete disregard of each other as in the furnace trade. Every other line has its national or local organizations which bring the members together at stated periods, but the furnacemen go their several ways as though contact with one another was to be especially avoided. Can they not be brought together?

The Oil Stove Market.

In the old buildings of large cities, which are generally well populated, the heat attending the use of coal for cooking in summer brings a desire for something less heating. Frequently these buildings are not piped for gas and the insurance interferes with the use of gasoline. This is no small market and the oil stove at present seems to monopolize the trade, though patented fuels have had a passing favor. The old stove of the past is barbarous compared to the clean, convenient, easily manipulated, high power oil stove of to-day, which holds its own in the line of progress. The modern oil range is attractive in appearance and is found in the suburban districts in the kitchens of many who are well to do, as it is capable of meeting all the requirements imposed upon it. The kitchen is by no means its only field, for when the heating stove in many shops is dispensed with the oil stove is relied upon to furnish the heat required for a myriad of purposes. The fuel being inexpensive and the heat readily controlled the oil stove in all thickly inhabited districts is destined to play an important part.

H. WATERMAN, manager of the New York house of the Cleveland Foundry Company, 107 Beekman street, is distributing among the trade a catalogue devoted to gas and oil cooking stoves.

FRANK P. GLAZIER of the Glazier Stove Company, Chelsea, Mich., is the assignee of a patent recently granted to A. R. Welsh of that place for certain improvements in oil stoves. The invention consists in the peculiar construction of the base and of the drip pan and its support. The arrangement is such that the ordinary roller base, usually employed where a drip pan is used, is dispensed with. The claim is made that the construction employed is very simple and cheapens the manufacture of such stoves.

Electric Cooking.

English electricians deserve much credit, says the *Despatch*, for the practical way in which they have solved many of the problems arising out of developments in electrical cookery. A well-known writer on the chemistry of cooking has given it as his opinion that the perfect arrangement for an oven would be the radiation of its heat from all sides. This is now done in an electric oven which is having a large sale in London.

The process is said to produce a cooked meat that is absolutely wholesome and extremely appetizing. There is no combustion whatever in the oven, and the food, being cooked in a pure atmosphere, cannot possibly be tainted. The heat is turned on at any part merely by the movement of a switch. It is produced in the oven, and is so conserved that after the oven is once made hot, what is required to carry on the process is little more than that sufficient to make up for slight leakages. The electric oven can be put on the kitchen dresser when needed, and it throws off, practically, neither heat nor smell.

Tabulated lists are provided from which, the weight and description of the joint being given, full instructions are derived as to the time and temperature of the required cooking. Roast mutton takes a temperature of 330° F., beef 340° and veal 350°; and a heat of 370° is needed to give puff pastry its desirable tint and consistency. The comparative coolness of the outside of the oven is a singular feature; as a *chef* remarked at a recent dinner: "You could sit on the oven while you roast inside."

ODD PLATES.

A. WEISKITTEL & SON of Baltimore, Md., are favoring their friends in the trade with a very attractive poster, which shows some of their leading specialties. The central feature of the design, which is lithographed in colors, is a kitchen interior, showing a Fire King cabinet gas range in operation. In the upper right hand corner are vignettes of a two burner hot plate and gas broiler, while in the lower left hand corner is a four-tube gas radiator and an open fire place fitted with a gas log. There is also shown a bird's eye view of the works of the concern named. The make up of the poster is rich and effective, and when displayed in the store of the dealer cannot fail to attract attention.

THE DANVILLE STOVE & MFG. COMPANY, Danville, Pa., are about placing on the market a hot plate for gas in three sizes, a line of cheap furnaces and also a four-hole range in two sizes under the name of the Model Beaver.

A COMMUNICATION was received recently by a manufacturer of gasoline stoves from a consumer who had used a stove of their make for several years, in all seasons, for cooking. It contained the remarkable statement that during the period of the coldest weather we have experienced this winter his fuel bill for cooking for a family of five persons was but 15 cents per week.

THE CARTON FURNACE COMPANY of Utica, N. Y., have just completed their new foundry building, which stands upon the site of the one that was damaged by fire about five weeks ago. The new structure is 54 x 90 feet in size, half of the building being two stories high and fire proof throughout. The structure is

of brick with a truss roof, the doors being fire proof and the shutters covered with tin. The interior is lighted from both sides as well as from a skylight. These dimensions are considerably in excess of those of the old building and give additional molding accommodations for 10 men, making 55 in all. The cupola is 16 x 54 feet and the equipment throughout is of the most modern type. The plant is now running with a force of 125 men. The cost of the rebuilding and improvements is said to reach nearly \$10,000, and to accomplish so much work in such a short space of time is a credit to the enterprise of the management. The work was done under the supervision of John B. Jones, the secretary of the company.

THE A. J. LINDEMANN & HOVERSON COMPANY of Milwaukee, Wis., have recently issued from the press an illustrated price-list of stoves and sheet metal goods which they manufacture. The little volume consists of 64 pages, profusely illustrated, and is bound in colored paper covers with gilt side title. Since the last catalogue was issued the company have nearly doubled their facilities for manufacturing gas and gasoline stoves and their entire line has received many additions as well as improvements. The opening pages are given up to the L. & H. Juniors, shown in a variety of styles and sizes; after which we find the L. & H. single generator cabinet stove; the L. & H. Ideal, shown with and without step, and the L. & H. Process, an illustration of which appeared in these columns not long since. The latter portion of the catalogue considers the L. & H. Grand Cabinet ranges for burning gas; the L. & H. Gem, together with lamp stoves, ovens, oil heaters, torches, elbows, coal hods, stove pipe, &c.

THE PLYMOUTH FOUNDRY COMPANY of Plymouth, Mass., have issued from the press an attractive catalogue of 48 pages illustrating the leading specialties they manufacture. The Plymouth range is made in 70 different styles and sizes and is adapted to meet all reasonable requirements. The catalogue also gives attention to the Crown Royal six-hole range, made in several styles and sizes; the Royal Grand, a first class construction embodying the modern features; the Art Royal, the Prize Royal and the Dexter ranges. The heating stoves are represented by the Royal Grand square parlor heater, the Art Royal sheet iron cylinder surface burner, the Prize Royal, the Plymouth Parlor, the Champion, a nest wood box stove, and the Radiant, a cheap cannon. In the opening pages of the catalogue there is a brief description of Plymouth Rock, the National Monument to the forefathers, Pilgrim Hall and the plant of the Plymouth Foundry Company.

PROBABLY the largest single shipment of oil cook stoves ever made in this country was that recently sent out by the Novelty Mfg. Company of Jackson, Mich. The train consisted of 15 freight cars, the goods being consigned to Butler & Johnson of Syracuse, N. Y. The firm named removed only one car-load of the stoves to their own warehouse, the remainder being reshipped to customers throughout the State. W. B. Johnson of Butler & Johnson stated to a representative of a Syracuse paper that the consignment mentioned would not be sufficient to meet their season's requirements, and that he expected before August 1 to receive at least 25 additional carloads. It is stated

that last season the firm sold something over 15 carloads, and the demand this year is far ahead of that a year ago.

LUTHER & LEDERER, 9-11 D's broomes street, New York, are issuing to the trade their spring catalogue for 1895. It contains 28 pages devoted to gas and oil cooking appliances. Some new sizes have been added to their Enterprise cabinet gas range, some sizes of which are made with gas water back. This is followed by several pages devoted to gas hot plates, the newest being made with two, three and four burners setting up on high feet. They also show a gas water heater to be used in connection with kitchen boilers. These are followed by some tailor and laundry stoves and a plumbers' solder furnace, several pages devoted to oil stoves of different character, and a line of Enterprise lamp stoves. The last pages in the book are devoted to gas stove appliances and equipments.

THE CINCINNATI STEEL RANGE & FURNACE COMPANY of 153 West Fifth street, Cincinnati, Ohio, have recently issued a circular letter to their friends in the trade in which attention is called to the lines of high grade kitchen outfits manufactured by them. These outfits are referred to as embodying the latest improvements and as being adapted for first class hotels, clubs, *cafes*, public and private institutions, &c. The outfits consist of Burton steel ranges, French broilers, steam tables, carving tables, plate warmers, coffee and tea urns, bake ovens, steam dish warmers, jacket kettles, cake griddles, waffle and laundry stoves, copper ware, &c. These goods are constructed in a substantial manner according to the most approved plans and the manufacturers state that they are prepared to furnish complete kitchen outfits and guarantee entire satisfaction in all cases.

J. D. MARVIN, the New York representative of Rathbone, Sard & Co., at 254 Water street, New York, has a "Snap" which he hopes will become popular with the trade. Those who are interested in an up-to-date summer range should stop in to see it.

HUGH DAVIDSON has accepted the position of foreman of the Clinton Foundry of Fuller & Warren Company, at Troy, N. Y., to succeed the late John Thompson, who died recently. Mr. Davidson has for 25 years been foreman of the Empire Foundry, and is in every way competent for his new position.

THE EXCELSIOR STEEL FURNACE COMPANY, manufacturers of furnace fittings, are now occupying the entire building at 38 West Monroe street, Chicago. Their business has grown remarkably during the short time that has elapsed since its establishment. The building occupied consists of six floors in addition to the basement, each 44 x 204 feet, giving over 60,000 square feet according to the usual floor space occupied. But even this is not sufficient to provide the company with all the room needed, and they have been obliged to build galleries on several floors for the purpose of arranging bins to store their enormous stock of furnacemen's supplies. The visitor to the establishment is surprised to find how carefully every cubic foot of space has been utilized, but in looking over the stock he speedily realizes that it is essential in order to successfully conduct a business which comprises so many details. From basement to top floor the most perfect system obtains. In the basement are stored furnaces

cast iron radiators and other heavy goods. Here also are machines for working on heavy steel plate for the various parts of the Excelsior steel furnace. In the rear is a circular saw, constantly occupied in sawing lumber for crating. This lumber is cut exactly to the inch for making the numerous sizes of crates required. It is then elevated to the shipping floor and each size is separately stored in a labeled bin, so that the packers have no cutting or fitting to do in preparing goods for shipment. The upper floors are devoted to light manufacturing and storage. Special trucks or cars have been devised by which large quantities of goods can be easily shifted from one place to another, or removed to the shipping floor by either of the two elevators with which the building is supplied. The company are large consumers of tin plate, constantly carrying thousands of boxes in stock. They sell tin plate as well as furnace fittings, furnaces, steam and hot water radiators, &c.

AN ANNEX of the Chelsea Stove Works, Chelsea, Mich., owned and operated by F. P. Glazier & Co. as a tin shop, was destroyed by fire on Tuesday, together with a large portion of its contents.

ARTICLES of INCORPORATION were recently filed in the office of the Secretary of State at Columbus, Ohio, by the Monroe Stove Company of Mansfield, the capital stock being placed at \$25,000.

WE QUOTE THE FOLLOWING from a letter recently received from a furnace manufacturer: There is no doubt in my mind that more attention in the future will be given to improving and perfecting the hot air system, for the reason that purer air is obtained by it than with steam or hot water heating, unless indirect radiation is resorted to. This, however, is expensive to put in and expensive to run, and it requires a skilled man to handle it to avoid accidents. It is my belief that if first class hot air furnaces of sufficient size were always used instead of small, insufficient, cheap heaters, hot water and steam would be but little employed.

AT A RECENT MEETING of the stockholders of the March Brownback Stove Company at Pottstown, Pa., permission was granted the directors to lease or sell the property of the company at 3626 Powelton avenue, Philadelphia. At this meeting officers and directors were elected, the latter consisting of James Brownback, James Rogers, T. J. March, H. M. Ebert, Franklin March, A. K. Shaner, H. G. Kulp and John H. Towers. The officers elected for the ensuing year are James Brownback, president; James Rogers, vice-president; T. J. March, treasurer, and H. M. Ebert, secretary.

THE WEIR STOVE COMPANY of Weir Village, Mass., have been making some improvements in connection with their plant, and among other things are putting on a new roof to one of their buildings.

IT IS STATED that the Lebanon Stove Company of Lebanon, Pa., recently took an order from a New York concern for 200 gas stoves. If the goods prove satisfactory it is intimated that a large order will result.

L. B. JONES, successor to the Security Gas & Vapor Stove Company, St. Louis, Mo., reports a large demand for their Independent Barbecue broiler, which can be attached to coal ranges

and makes a summer and winter broiler. James & Kirtland, New York, who are Eastern agents for the sale of these broilers, are attaching them to their B. B. ranges, and report that they are giving excellent satisfaction.

THE FRONT RANK STEEL FURNACE COMPANY, St. Louis, are sending out to the trade an illustrated catalogue describing the Mouat hot water heater, for which they are sole agents. This heater is referred to in the catalogue as being the most powerful, economical, durable direct circulator of hot water in the market. The catalogue contains engravings of a number of churches, residences, schoolhouses, &c., which are heated by the Mouat heater. In addition to this the catalogue contains cuts of the heater with sheet iron jacket and heater set in brick work; also side view showing circulation, construction, &c. The catalogue is handsomely printed and will be sent to the trade on application.

HENRY BARTHOLOMAI for nearly ten years past foreman of the foundry of the Enterprise Stove Company, Vincennes, Ind., committed suicide on March 16 while temporarily insane. He had complained of feeling unwell for two weeks or more, but no serious thought was given to it for the reason that he continued to perform his duties as usual. On Saturday morning he left home at 6 o'clock to open the foundry, and was found dead a half hour later. He was 45 years old, had always lived a strictly temperate and upright life. He leaves a wife and seven children, who have the sympathy of the entire community in their sad bereavement.

W. H. MARTIN, Chicago manager for the Peck-Williamson Heating & Ventilating Company, has removed his office and salesroom temporarily to room 1 at 59 Lake street, Chicago. After May 1 he will be permanently located in another part of the same building but with entrance at 41 State street.

THE SANITARY PRESSERS' ASSOCIATION, composed of the workmen in the sanitary potteries at Trenton, N. J., have decided to accept a new wage scale, which reduces the rates paid a year ago from 33 $\frac{1}{2}$ to nearly 60 per cent. This action is the result of a war begun at the end of last summer between the Trenton Potteries Company and the factories outside the sanitary ware syndicate, as a result of which the selling prices were reduced between 50 and 60 per cent. Wares were, for a time, sold at practically less than the cost of manufacture. The reduction accepted by the Trenton workmen will, it is believed, compel the closing of nearly all the Western sanitary potteries. The new wage schedule comes into effect on Monday, when the men will return to work after a long period of idleness.

FORTY POTTERS at the Great Western Pottery, Kokomo, Ind., went on strike on Monday on account of a reduction of 15 per cent. in wages. The company claim that all the Eastern potters have made a cut and that they are compelled to do the same or go out of business. It is expected that the reduction will probably stand.

THE LEAD WORKS of Tatham Bros., 224-226 South Fifth street, Philadelphia, were damaged by fire to the extent of \$3000 on March 22.

SCRAP.

J. H. ROGERS, managing partner of E. Morewood & Co. and the Swansea Tin Plate Company of Wales, arrived at New York last week from England. Mr. Rogers is now visiting the works of the Morewood Company, at Gas City, Ind.

WORK on the new tin plate factory recently located near Frankton, Ind., will, it is announced, be begun at once. The plant will probably be ready for operation about October 1.

N. & G. TAYLOR COMPANY, Philadelphia, contemplate erecting an addition to their works during the coming spring for the production of continuous roofing terne. The company began the manufacture of this material during the past year and are now turning it out with great success. They are also arranging for the production of large tinned sheets, which they expect to able to place on the market at a lower price than that now asked for this material by foreign manufacturers.

THE AMERICAN TIN PLATE COMPANY, Elwood, Ind., find plenty of work for the recent addition to their plant. Their mills are reported as running to full capacity, turning out about 6000 boxes of finished plate every week.

ON TUESDAY, March 19, in the presence of a large number of townsfolk, the new plant of the Montpelier Steel & Tin Plate Company of Montpelier, Ind., was opened, to the strains of music from a band composed of workers in the mill. The first sheet was rolled by Harry Herbert, the superintendent, from fine open hearth steel, the operation being a complete success. The mill is now running regularly night and day and turning out some 30 tons of black plates of excellent quality daily. The equipment of the works consists of 6 Totten & Hogg hot and 6 cold mills and 12 tinning sets. Two of the mills are not yet completed, but will be in operation shortly. Several grades of tin and terne plates will be produced. The works will employ over 200 hands. The office of the Montpelier Steel & Tin Plate Company is in the Board of Trade Building, Columbus, Ohio.

WE ARE indebted to Bruce & Cook, 190 Water street, New York, for a copy of the second edition of the valuable table of net weights of tin plates, distributed by the firm with their annual calendar, and which was reproduced in *The Metal Worker* of January 12. To the original table has been added in this edition the net weights of wire gauge D plates, and also taggers iron and tin.

THE CONSTRUCTION of the tin plate mill of the Lughlin Nail Company at Martin's Ferry, Ohio, is progressing satisfactorily, and the works will, it is expected, be in operation by June 1. The plant will consist of four hot mills and three cold mills, with accompanying tinning sets. The output of the concern will include charcoal and coke bright plates, as well as roofing terne.

THE PLANT of the Crescent Sheet & Tin Plate Company, at Bessemer avenue, Cleveland, Ohio, will be completed and ready to run about May 1. Buildings and power are provided for six hot mills and ten tinning stacks. The start will be made with four hot mills, two others and the tinning department to be added in the course of the summer.

THE TIN PLATE DEPARTMENT of the Old Dominion Iron & Nail Works Company, Richmond, Va., is now in active operation, turning out a full line of bright and roofing plates. The company contemplate building a four mill black plate plant in the near future.

THE AETNA STANDARD IRON & STEEL COMPANY of Bridgeport, Ohio, expect to have their full complement of eight tin mills in operation by April 1. A large addition which they are making to their tin house equipment will be ready by the middle of that month, by which time the works will possess a materially increased capacity for production.

PREPARATIONS are now being made by the Atlanta Steel & Tin Plate Company, Atlanta, Ind., for an addition of 175 x 80 feet to their main building, in which will be placed three additional tin mills and a bar mill, making their works a six mill plant.

THE report is given out that Sydney W. Bypass and Robert Sirvin, two English capitalists, have been visiting Sharon, Pa., with the object of locating there or elsewhere in that section a large tin plate works, to be erected in the near future.

THE MILLS of the Somerton Tin Plate Works, Brooklyn, N. Y., have been running full, on three shifts, since November last.

THE PLANT of the Beaver Tin Plate Company, Lisbon, Ohio, is fast nearing completion, and is expected to be put in operation by April 10. The company have four tin mills and eight tinning sets. They propose producing both charcoal, coke andterne plates.

THE TIN PLATE PLANT of Marshall Bros. & Co., Philadelphia, is running full, turning out their well-known brand of Penn Treaty, charcoal, coke andterne plates, for which they find an increasing sale. An additional tin mill is in course of erection, which will make a total of five in all.

THE TINNING DEPARTMENT of the American Stamping Company, Brooklyn, N. Y., has been shut down indefinitely.

THE BALTIMORE IRON, STEEL & TIN PLATE COMPANY, Locust Point, Baltimore, Md., advise us that their mill, which has been closed down since October 6, will start up on April 1 after considerable enlargement and improvement.

THE WORKS of the Ellwood Tin Plate Company, Ellwood City, Pa., are now in full operation with four tin mills and eight tinning sets. The company are producing a line of four grades of bright charcoal plates, a brand of coke tin and five brands of roofing plates.

AFTER SEVERAL MONTHS of labor troubles the United States Iron & Tin Plate Mfg. Company, Dammier, Pa., have their works now running to full capacity. They advise us that they are now in a position to regularly supply the trade with their well known brands of bright andterne plates.

THE MORTON TIN PLATE COMPANY, Cambridge, Ohio, have had their three black plate mills in regular operation since January 1, with every success. They have now started their dipping works and have commenced the production of tin andterne plates.

GUMMEY, SPERING & Co., Philadelphia, report an improvement in the demand for their brands of tin andterne plates. Their Pennsylv Old Method roofing plates, they state, are in particularly active demand.

These plates they guarantee to contain 45 pounds of coating to every box of 112 sheets, 20 x 28, which it is claimed is all any plate will hold. Their Alderley roofing plate is increasing in popularity, and the reports concerning their Gumme Anti - Pinhole bright tin plates are most satisfactory. These plates, the firm state, are made in the old-fashioned way from Swedish bars hammered out, and the process of manufacture is so slow that four boxes only per day are turned out. They are largely used for making tinware required to stand long service, such as hotel ware. Phoenix is the name of an imported brand of bright plates sold by the firm, and it is claimed that they are the heaviest coated of any coming to this market. The firm have a good stock of plates of all kinds on hand at their store, there being upward of 1000 tons in sight on their main floor. There is also a stock of about 200 tons of galvanized iron on the same floor.

THE HENDERSON TIN PLATE COMPANY's tinning plant at Norristown, Pa., has been sold out to a new concern, who have commenced business under the name or style of the Filley Tin Plate Company. The new concern enter the market with seven brands ofterne plates and four brands of brights. Theterne brands are Filley Old Style, Filley Roofing, Fidelity, Champion, Union, Victory and Admiral. The brands of charcoal brights are Ridant and Adonis, and of the coke brights Hero and Ella.

THE OHIO RIVER SHEET & TIN PLATE COMPANY, composed principally of former employees of the United States Iron & Tin Plate Mfg. Company at Dammier, Pa., have been organized, and will erect a tin plate plant at Remington Station, on the Pittsburgh, Fort Wayne & Chicago Railroad, near Rochester, Pa. It will be a two-mill plant, and the contract for the erection of one stand of roughing rolls, two 24 x 32 inch hot mills and two 22 x 34 inch cold mills has been placed with the Leebach Foundry & Machine Company, Pittsburgh, Pa. Alexander Sauters is president of the new concern. The Leebach Foundry & Machine Company shipped last week four cold mills to the La Belle Iron Works, Wheeling, W. Va., one Mesta patent pickling machine to the Pennsylvania Tin Plate Company, New Kensington, Pa., and another to the Crescent Sheet & Tin Plate Company, Cleveland, Ohio.

JOHN S. TREGONING of J. S. Tregoning & Son, owners of one of the largest tin plate works in South Wales, announced lately that their plant at Morfa was shut down indefinitely, and would not run again until the condition of things in South Wales was much improved. Messrs. Tregoning's works have been running continuously for more than a generation, and the majority of their work people have grown up in them, some having been in the service of the firm for over 40 years. This action, which has been forced on the firm by the present condition of business, means absolute ruin to many of these people, who are fit for nothing outside the tin plate trade. This is only one of many similar cases in the Welsh tin plate districts, where the distress among this class of labor is very keen and the prospect of relief exceedingly remote.

RECORD MFG. COMPANY, Conneaut, Ohio, a cable to report extreme activity in their tin plate manufacturing department. The company are turning out bright charcoal and coke plates.

A REPORT from Elizabeth, N. J., states that a company, to be known as the Elizabethport Tin Plate Company, have been organized at that place, with a capital of \$150,000, to manufacture tin plate in the plant formerly owned by the Morewood Tin Plate Company, on Staten Island Sound. The property, which covers three acres of ground, has, it is said, been bought from the Morewoods by the new concern, who will increase the capacity of the works. H. Pritchard is named as general manager, and the date given for the beginning of operations is June 1.

THE FRANK KNEELAND MACHINE COMPANY, Pittsburgh, Pa., have completed and shipped all the mills and shearing machinery for the Pennsylvania Tin Plate Company, New Kensington, Pa., and the Crescent Sheet and Tin Plate Company, Cleveland, Ohio, both being four mill plants. They have also recently shipped the shearing and tinning machinery for the new plant of the National Tin Plate Company, Anderson, Ind.

TRADE REPORT.

The Iron Market.

The official announcement that the price of Connellsville furnace Coke is to be \$1.35 per ton at oven has removed a fruitful topic for guessing. The figure is higher than was generally believed probable and represents an advance of 45 to 50 cents. It is justified on the plea that the advance in wages demands it and that the Coke operators are tired of exhausting their property for the privilege of furnishing their customers material at cost or below it.

The advance will meet with much resistance, since there is a chance that it may not be firmly maintained. Furnacemen will draw upon accumulated stocks until they are exhausted, so that the Coke trade is expected to be pretty dull early in April.

In line with the recent purchases of Pig by a leading Pittsburgh concern is the buying of 10,000 to 15,000 tons of Old Material by the same interest. It is reported that a similar buying movement has taken place in the Mahoning Valley.

Cincinnati reports sales of 20,000 to 25,000 tons of Pig Iron, thus showing a continuance in the activity in that market. In other sections the movement is moderate. The advance in Coke ought to give the Southern furnaces an advantage of about 50¢ a ton over their Northern rivals, whose cost of production will be increased.

Pig Iron.—Reports from New England indicate that there is a somewhat better movement there. In the New York market business is dull and competition is very keen. We quote \$12 @ \$12.50 for No. 1; \$11 @ \$13 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.25 @ \$11 for No. 2; \$10 @ \$10.50 for No. 3; \$10 @ \$10.75 for No. 2 Soft, and \$10.50 @ \$10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.50 @ \$10.

A very considerable improvement in the demand for Pig Iron is reported from Philadelphia, and in Bessemer an advance of about 25¢ per ton. In non-Bessemer, however, prices are unchanged, although there is less Iron for sale at the inside figures, and in some instances sellers ask a trifling advance, but nearly all the sales were at last week's prices. Some large lots were taken, the volume of business averaging larger than for many months past, the idea among consumers being that if prices do not advance they will certainly not decline. There is a full supply, nevertheless, and holders have not been slow in meeting the demand when the right kind of bids were made. Asking prices are slightly higher and in most cases about as follows for Philadelphia delivery and 20¢ @ 25c less for points within a radius of 100 miles South or West:

According to advices from Chicago, trade in local Coke Iron was hardly as active the past week as it has been, but the volume is still excellent and better inquiries are now in hand. The firmness of the local makers is somewhat resented by large consumers who are approaching the time for renewing contracts, and they are endeavoring to make a break in the line. It is likely that some of these purchases may be deferred in the hope of tiring the manufacturers. Business generally, however, is large enough to make the latter feel quite sure of their ground. They are, therefore, slightly advancing prices instead of marking them down. Business in Southern Coke Iron has been only of moderate dimensions. The attitude of Southern furnacemen is fairly firm, but occasionally a concession is given to secure some specially desirable order. Lake Superior Charcoal has been extremely quiet. Quotations are as follows for cash:

Lake Superior Charcoal.....	\$12.75 to \$13.00
Local Coke Foundry, No. 1.....	10.25 to 10.50
Local Coke Foundry, No. 2.....	10.00 to 10.25
Local Coke Foundry, No. 3.....	9.50 to 9.75
Local Scotch No. 1.....	10.25 to 10.50
Ohio Strong Softeners, No. 1.....	12.50 to 13.00
Southern Silvery, No. 1.....	11.50 to 11.75
Southern Silvery, No. 2.....	11.25 to 11.50
Alabama Car Wheel.....	10.00 to 10.25
Southern Coke, No. 3.....	9.50 to 9.75
Southern, No. 1 Soft.....	10.00 to 10.25
Southern, No. 2 Soft.....	9.75 to 10.00
Alabama Car Wheel.....	17.50 to 18.00
Jackson County Silvery.....	15.00 to 15.25
Other Ohio Silvery.....	14.25 to 14.50

Sales during the week in the Pittsburgh market have been exceedingly light. The demand for Foundry Irons does not improve and prices are as low as ever. Recent sales of Foundry Iron have been made at prices as low, or lower, as have yet been made. Under existing conditions it is somewhat difficult to quote the market, but for April and May delivery it is fairly represented by the following quotations:

No. 1 Foundry.....	\$10.25 to \$10.50, cash
No. 2 Foundry.....	9.50 to 9.75

Further large sales of Pig Iron have been made in the Cincinnati market during the past week, and at the moment further transactions of importance and magnitude are pending. The aggregate transactions range between 20,000 and 25,000 tons, a prominent feature being the number of small orders placed. The Iron sold covers all sorts and kinds, both Coke and Charcoal, Northern and Southern brands, Mill and Foundry grades. If there is any predominance it is in favor of Mill Iron, one lot of 5000 tons being reported. Most of the transactions cover four to six months in delivery and one lot of 1000 tons Foundry Iron was sold to a local consumer for delivery during the entire year. Quotations are given as follows:

Southern Coke, No. 1.....	\$9.75 to \$10.00
Southern Coke, No. 2.....	9.00 to 9.25
Southern Coke, No. 3.....	8.50 to 8.75
Ohio Soft Stone Coal, No. 1.....	14.50 to 15.00
Ohio Soft Stone Coal, No. 2.....	14.00 to 14.50
Lake Superior Coke No. 1.....	11.75 to 12.25
Lake Superior Coke, No. 2.....	10.75 to 11.50
Hanging Rock Charcoal, No. 1.....	16.00 to 16.50
Hanging Rock Charcoal No. 2.....	15.75 to 16.00
Tennessee Charcoal, No. 1.....	12.00 to 12.50
Tennessee Charcoal, No. 2.....	12.00 to 12.50
Bessemer.....	11.65 to 12.00
Standard Southern Car Wheel.....	15.75 to 16.75
Lake Superior Car Wheel and Malleable.....	14.25 to 14.75

The demand for Pig Iron in the St. Louis market does not show any material change from the several preceding weeks. Orders are limited in size but are more numerous. The local consumption shows a steady increase and shipments are being received without any requests to hold them back. Prices are unchanged and No. 2 Foundry is quoted at \$6.50, f.o.b. cars Birmingham. It is difficult to induce consumers to anticipate their wants more than 30 days ahead, so that the volume of business is necessarily limited. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry.....	\$10.00 to \$10.25
Southern Coke, No. 2 Foundry.....	9.25 to 9.50
Southern Coke, No. 3 Foundry.....	9.00 to 9.25
Southern Car Wheel.....	16.00 to 16.50

Metal Market.

Pig Tin.—Speculation has been exceedingly cautious, narrow at that, but mainly "bullish" in a sentimental way. That is to say, some operators have made the most of conditions calculated to raise prices, and, meeting little resistance, accomplished something without adding much to their holdings. In other words, wholesale prices were carried up to the basis of 14¢ net cash for prompt and current month delivery, while the discount on futures has been narrowed as well. The purchases for out of town jobbing account and by consumers have increased somewhat, and indicate that deliveries, although somewhat extensive of late, have been well taken care of, leaving the market in quite good form, as far as position of stocks here is concerned. The market closed very firm with prices at the highest point of the week. Quotations on small lots of Straits from store are virtually unchanged at 14½¢ @ 15¢ per lb.

Copper.—Current report has it that considerable Copper has recently been sold for export. At headquarters the usual lack of knowledge of anything of the sort was displayed. The outside statements place the volume of business at about 2000 tons, but are extremely vague as to price and delivery. It would appear, however, that negotiation with home trade buyers has moderated somewhat and that offers at recent extremely low prices are not duplicated. To this extent the market has improved, but the turn is almost wholly on stock for immediate delivery. Forward deliveries are the subject of negotiation at prices upon which buyers and sellers appear to be considerably apart. In retail business inquiry has been moderate. Prices for small jobbing quantities are unchanged on a basis of 14½¢ for Lake Ingot.

Sheet Copper.—No material improvement is noticeable in the demand for Cornice Copper, which still keeps below the average of the season. Rather better inquiry is, however, regarded as indicating a larger business later in the spring, when building work now being sluggish or in contemplation gets well under way. The outlook is looked on as being decidedly more promising for this class of goods than has been the

No. 2 Soft.....	10.75 to 11.00

case for a year or two past. Small lots of Sheet Copper from store are quoted at the net list price of 14¢ $\frac{1}{2}$ lb

Pig Lead.—Business has been less active in this market the past week. Dealings and negotiation served to carry prices higher, however, and stimulative advices from the West gave additional tone. The price for small lots of American Pig from store rules at the same level that it has held for some weeks past, namely, 3¢ $\frac{3}{4}$ @ 3¢ $\frac{1}{2}$ lb.

Spelter.—Outside of ordinary car-load business there has been little doing here, but orders from other quarters have gone out more or less freely and the trade resulting therefrom has served to give the market quite good tone. Prices for small jobbing parcels of good Western brands are quoted at 3¢ $\frac{3}{4}$ @ 4¢ $\frac{1}{2}$ lb.

Sheet Zinc.—There is little change in the market for this material. Demand from consumers is commonplace in the extreme, and prices exhibit no change from the figures quoted from week to week for some time past, namely, 4½¢ @ 4¾¢ $\frac{1}{2}$ lb for 600-lb casks and 5¢ @ 5½¢ for smaller lots.

Antimony.—Business has been rather slow and the market is weakish under the influence of lively competition. Prices for small parcels are quoted at 9½¢ @ 9¢ for Cookson's and 8¢ for Hallett's.

Nickel.—Seller's quotations remain at 35¢ @ 40¢, according to quantity.

Tin Plate.—The market does not show quite as good form as it did a week ago. Large business, particularly in orders for future deliveries, has fallen off somewhat, and spot stock in quantities is only in fair demand. Small business, however, keeps up pretty well, and, in the aggregate, has not made a bad showing. Milder weather has stimulated the demand for Roofing Plates to some extent in this section. Prices have suffered no radical change, but the market is weaker to this extent, that it is easier to buy at figures that sellers mentioned very recently as being too low.

A special London cable dispatch of March 27 to *The Iron Age* reports on the British Tin Plate market as follows: Tin Plate has been in good demand and buyers have manifested eagerness to place contracts at last week's prices. Makers are reluctant to hook forward orders owing to uncertainty of the wages question. Asking prices average about 2 pence dearer. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, 10 14 x 20	9 3	¢	
Siemens Cokes, 10 14 x 20	9 3	¢	
Turners, 20 x 28	11 6	¢	2½¢
Charcoals, 10 14 x 20	10 9	¢	13¢

Sheet Iron.—The demand for both Black and Galvanized Sheets continues active, and the fact that buyers are insisting on early shipments indicates that stocks are light. Several of the mills have contracted for their output up to July 1, but others are firmer as to their prices for forward deliveries. Small lots of No. 27 Common Iron are quoted at 2 60¢ @ 2 65¢ from stock and of Galvanized at 75 and 10¢ off.

JACOB BROMBACHER'S SONS, 30 Cliff street, New York, manufacturers of Tinners' Tools and Machines, have moved their office in this city to their Brooklyn factory, 31 Fulton street, near Fulton ferry. Hereafter shipments will be made direct from the warehouse in Brooklyn, where a complete stock will be carried. The sample room is still maintained at 30 Cliff street.

Chicago Report.

Scrap.—Only a moderate trade is in progress. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb

Trade Notes.

WILLIAM CONNERS, Troy, N. Y., has secured a large order for American Seal Paint, with which the Hotel Champlain at Bluff Point, N. Y., is to be painted. The work to be done by Callanan & Prescott, Keese Valley, N. Y.

THE RECEIVERS of the McCullough Iron Company of Chester, Pa., have petitioned the court to be allowed to borrow \$32,000 with which to erect a galvanizing works.

WE HAVE RECEIVED from the Prince Mfg. Company, 71 Maiden lane, New York, a pamphlet entitled "The Rusting of Iron and Steel: How it May be Prevented and How it is Promoted." This pamphlet describes and mentions the principal characteristics of Prince Brothers' Mineral Brown, formerly called Prince's Metallic Paint. This Paint is made of iron ore which is carefully roasted to change it into peroxide of iron, which is then ground to an impalpable powder and finally mixed with pure linseed oil. It is stated that this paint is particularly applicable to iron and steel surfaces which it is designed to prevent from rusting; that it covers well, adheres with the greatest firmness and altogether forms a very perfect and durable covering.

CONDITION OF THE

Hardware Trade.

THE INDICATIONS OF IMPROVEMENT in the general business situation, which are quite marked in some directions, are regarded by many as the precursors of a general revival of trade and a return to a normal demand. Those who take a comprehensive view of the market are therefore watching it closely with a view of determining the probable course of things and deciding upon the policy which should be pursued, so as to take prompt advantage of any favorable turn. It seems hardly likely that the downward course of prices of raw material and staple goods can be continued much longer, and there are some indications of a strengthening in tone. In the Hardware market there is little new to report. Prices are not materially changed except in the matter of Tacks. There is a perceptible improvement in the demand in many sections, and the South and West are certainly doing a fair, and in some cases a good, business. The Eastern and Middle States apparently are not quite so active, the trade being still very conservative in their purchases. Business is also somewhat spasmodic and uneven. Seasonable goods have a prominent place in nearly all orders. Some manufacturers report business nearly up to normal volume when it is estimated by the quantity of goods handled, but the low prices now current keep down the aggregate in dollars and cents.

Advices from Chicago.—Heavier business is reported by Shelf Hardware jobbers. The packing floors of the local houses now look very much like old times. A few concerns have recently been obliged to employ their packing force at night. The demand covers all kinds of merchandise. The country trade is evidently forcing merchants to buy much more liberally, as orders are almost invariably specified for prompt shipment, showing that goods ordered are immediately needed by consumers. Tinware is in very good demand. Tin Plates are moving more freely, and Roofing Plates have again taken their proper place in shipments from local jobbing houses. Staple goods are moving only moderately and are not contributing their usual bulk to the volume of the business. The Heavy Hardware trade is much better than at any previous time this spring. Wagon makers, blacksmiths and machine shops are purchasing quite freely, and in some cases stocks are being ordered by consumers who think this a good time to make a little preparation for the future.

Notes on Prices.

Wire Nails.—There is a good deal of inquiry and a pretty free movement of Nails, but the market shows the effect of the recent large purchases, many jobbing houses being apparently supplied sufficiently to cover their present requirements. It is expected that with the advance of the season business will increase in volume and that a large trade will be done. The market in the matter of prices is in substantially the same condition as a week ago. Most of the manufacturers are maintaining prices quite firmly and the market has a good tone.

Advices from Chicago.—A very good carload trade is reported by manufact-

urers, with some indication of stocking up among the jobbers, outside of this immediate locality. Orders which are so received are in every case for immediate shipment. The manufacturers hope that this is the forerunner of the usual spring rush, which has now been delayed some three or four weeks owing to the steadiness of the cold weather. Jobbers' prices show no change, but stand at \$1 to \$1.05 for small lots from stock, with a few houses still quoting 95 cents for carload lots. The end of these low prices, however, is very rapidly approaching.

Cnt Nails.—Trade has not been especially active during the past week, but the mills report a good many inquiries and refer to the indications for the opening season as being on the whole encouraging. Small lots from store at New York are quoted at 85 to 90 cents.

Advices from Chicago.—Manufacturers have recently enjoyed an excellent trade in carload lots, but have as yet seen no disposition among their customers to lay in stocks. Small lots from stock stand at \$1.

Barb Wire.—Manufacturers continue to take a hopeful view of the outlook and report inquiries and orders good for the season, considering the prevailing conditions. Prices are about as they have been for the past week or two. The disposition of some of the jobbing houses to shade manufacturers' quotations is having some effect on the market.

Advices from Chicago.—The large business noted last week has maintained its volume, but it did not develop into the great activity expected. This was probably due to less favorable weather for a few days, which, however, has again changed for the better. Business now in progress is well up to the capacity of the mills, but at this time of the year manufacturers are accustomed to being rushed. It is expected that within the coming month a heavier trade will surely be felt. Small lots from stock are quoted in a regular way at \$1.05 and \$2. Some of the jobbers, however, continue to cut manufacturers' prices 5 cents per 100 pounds, but they say the situation is such that these extreme prices are likely to be withdrawn any day.

Tacks.—Revised list prices on Tacks, to which reference was made in our last issue, have been announced by the Atlas Tack Corporation and other leading manufacturers. In the new list prices are revised throughout and inequalities in the old list corrected. With the exception of a few unimportant corrections made in 1889, there has been, we believe, no revision of the Hardware Tack price-list since 1882. Since that date numerous new styles of packing have come into vogue, and as a consequence numerous price-lists to correspond. One object of the manufacturers in adopting this new list, which will be known as the list of March 25, 1895, is to consolidate these lists in one, with the correction of inequalities, so as to make it represent the present costs of the goods. Under the former list the smaller sizes were relatively too low and the new list prices are accordingly increased. From the discount sheet which is given below it will be seen that the list is relatively a high one, the manufacturers having adopted this policy in accordance with the request of the various jobbers' associations for high lists and long discounts. The new list has been adopted by nearly all the

manufacturers in the country, and it is hoped that it will be found to give satisfaction to all interests and remain for a long time without change. The few manufacturers who did not participate in the preparation of the list will undoubtedly adopt it, so that it will be uniformly used. The discounts applying to the new list are as follows, with an additional 33½ per cent. and 2 per cent. for cash, with the usual deliveries:

	Discount. Per cent.

Freight will be prepaid or the actual cost of delivery will be allowed on goods in quantities of 300 pounds or more to Boston, New York, Philadelphia, Baltimore, and to the principal points on or east of the Missouri River.

Milk Can.—The Porcelain Lined Milk Delivery Can put on the market by Stuart & Peterson Company, Burlington, N. J., and illustrated in our last issue, is sold at 50 cents for the 1-quart size, and 70 cents for the 2-quart size, subject to a discount to the trade of 50 per cent.

Roaster or Oven.—Leach Roaster & Baker Company, Paxton, Ill., are manufacturing the Champion Roaster or Oven which was illustrated in *The Metal Worker* of the 29d inst. This article is sold from the following list, which is subject to a discount of 33½ per cent. to the trade:

No.	
1.....	\$1.50
2.....	2.20
3.....	2.65

Glass.—The sub-committee appointed by the Window Glass manufacturers to inquire into the cost of imported Glass in the East has verified the statement which has been made that domestic

Glass has been sold below the price of the imported article. The difference in price is stated to average about 15 per cent., and has had the effect, it is believed, of keeping something like 1,000,000 additional boxes of foreign Glass out of the market. While the low price of American Glass has kept so large a quantity of foreign Glass out of the country, it has done so at the expense of the home manufacturers, which in some cases has been so sorely felt that better prices are deemed a necessity. It is considered probable that when prices take an upward turn the price of imported Glass will be the basis governing the selling price of American Glass. It is not improbable that the cost of American Glass, at least of some sizes, will be increased by the demands of the workers or by concessions in wages on the part of manufacturers, or by both, before the factories start in the fall. The outlook indicates no scarcity of Glass for the spring and summer trade, as it is estimated that there are from 1,200,000 to 1,800,000 boxes of Glass in the hands of the manufacturers, buyers and large consumers. There is no change in the condition of trade, the demand being limited and for immediate consumption only, while prices are in an unsettled condition.

Old Metals.—The demand continues fair, but the supply of most kinds of Old Metals is amply sufficient to prevent any radical change in prices. In Iron there is a good demand for Cast and Scrap. Quotations in a general way are unchanged, the following representing dealers' purchasing rates for moderate lots, New York delivery:

The Close of the Trade School Season.

With the advent of spring comes the termination of the winter's work of the various trade schools in this section of the country. During the last week of March the majority of these institutions habitually wind up their season and award certificates to those pupils who have earned them. For this reason considerable space in this issue is claimed by trade school matters. It is encouraging to find that the past season's experience of all these schools has been satisfactory, despite the fact that the building trades, to which, more than to any other industry, they cater, have been suffering under an unusual strain of depression. The growth of the trade school movement in the United States has been comparatively slow, but it is gaining ground from year to year. It is to be hoped that by next winter some further accessions will be made to the ranks of these most valuable institutions.

The List of American Tin Plate Works.

In the present issue is printed our regular quarterly list of American tin and black plate works, with the names of the brands of tin andterne plates made by each. This compilation is the most complete and accurate list of the domestic works yet published. It will be particularly interesting and valuable to the trade on account of the details given therein as to the number of black plate mills in existence, in operation and building at the close of March. The figures presented, which were furnished by the manufacturers themselves, demonstrate very clearly the remarkable growth in importance of the American tin plate manufacturing industry even during the past half year. We take this opportunity to tender our thanks to the representatives of the various firms named on the list for their prompt-

ness and courtesy in supplying the information from which the list has been compiled.

The Retail Merchant and Irregular Competition.

In many parts of the country retail merchants are suffering keenly from irregular competition. Those who are located in large cities find the great department stores cutting into their trade, while those who are conducting business in small towns are subjected to inroads of peddlers or find their patrons ordering goods by mail or express from large farmers' supply stores. Thus all classes of merchants, whether in city or country, have their special grievance. These troubles are not new, but some of them are of long standing. During these times, however, with the general curtailment of trade and the diminished profits realized, the burden of such competition becomes more grievous than ever. It is extremely discouraging for a merchant to lay in a carefully assorted stock, calculated to meet all possible requirements of the community in his line, and discover that his patrons merely buy from him what they are absolutely unable to get from a department store or a farmers' supply house. The local merchant is then used merely as a convenience or a makeshift, and the long years in which he has acquired his knowledge of the business and the ability to appreciate what the consumers of hardware want, count for nothing. The bargain counter in a department store wins the customer, even if he learns very soon afterward that the temptingly low price meant a correspondingly poor article.

Way to Meet Competition.

There is no remedy of a general character which can be devised to meet and correct these unsatisfactory conditions. Each retail merchant is obliged to contrive some method of his own to counteract the invasion of his trade by his irregular competitors. The mercantile field is open to everybody and in no possible way could restrictive measures be introduced. The owners of a department store, the managers of a supply house and the backers of peddlers' wagons are violating no law when they merely compete with hardware merchants and capture some of their trade. Violent denunciation of such methods will do no good. Other means must be tried if a merchant is desirous of holding his customers. The main thing to do is to acquaint a neighborhood as thoroughly as possible with the character of the articles carried in stock and

their prices. It is too often the case that a retail merchant will insert a small card in his local newspaper, giving his name and business with some catch phrase, such as "Large stock at low prices," and permit the advertisement to stand unchanged week after week. He will then make no further effort to attract the attention of the public, contenting himself with the thought that they know where his store is and what he keeps. His customers never know his prices unless they ask specifically the value of each article. Their ignorance keeps them in good condition to be influenced by the quotations ever before their eyes in the advertisements of department stores or in the circulars of supply houses.

Educate the Buyer.

A merchant should expend a reasonable amount in educating his customers. He should frequently send them circulars calling attention to some special articles, each time giving prices and brief points as to their merits. When he gets in seasonable goods he should let his neighbors know it. If he accepts the agency for a new line of goods he should stir up the town. If he receives something particularly nice he should feel so enthusiastic over it that he would be unable to restrain himself from letting every man, woman and child in his territory know the important fact, together with the very low price at which it could be obtained from him. He should regard it as a reflection on his shrewdness as a merchant if a canvasser or peddler should be able to sell any of his regular customers an article of an inferior quality or at a higher price than he stands ready to furnish. If he has any reason to suspect that his particular bailiwick is likely to be invaded by rival sellers of any article he should immediately advise his customers of the bargains in the same line to be found in his store. As vigilance is the price of liberty, so is watchfulness the salvation of the retail merchant.

Arrangements for the establishment of the Franklin Trade School in Boston move slowly. It is said, however, that the obstacles which have hitherto stood in the way of the project are being gradually removed under the pressure of public sentiment, which manifestly favors the scheme of a trade school pure and simple as distinct from a manual training or technical institution. Such a school would be of incalculable benefit to the native youth, not of Boston alone, but of the whole of the New England States, for which it would, with the ample pecuniary resources at its command, be a splendid center of trade training.

THE LETTER BOX.

Joints in Greenhouse Piping.

From Y., *Rondout, N. Y.*—I have been given the contract for heating a large conservatory, which will take 2000 feet of 4 inch cast iron pipe; and I would like to know something of the method of making the connections in it.

Note.—It is probable that some of our practical readers can give this correspondent some valuable suggestions. Rust joints in cast iron pipe used for greenhouse heating are by many considered most serviceable. These joints are made with what are generally called iron filings; but these should not be too fine, or resemble dirt. It is better to have the iron filings coarse, or more correctly speaking, machine cuttings. Those best adapted for these joints are from castings made from soft, strong iron, and entirely free from grease of any character. They should be prepared for use by being wet down with water that is slightly salt. Too much salt is objectionable, and the resulting expansion may break the hub end of the pipe. In order to prevent these filings from getting into the inside of the pipe, the bottom of the joint should be packed with oakum and the filings packed on top of it. Another method is to use red lead on top of the oakum applied in several layers, first oakum and then red lead. The success and durability of this joint depends on the quality of the red lead used, and the care with which the joint is made. Sometimes Portland cement is used instead of the red lead between the layers of oakum.

A Mismanaged Furnace.

From C. H., *Mansfield, Ohio.*—I have a hot air furnace which is causing me some trouble, and I hope that some of the readers of *The Metal Worker* can help me solve the problem. Last fall I placed a hot air furnace in a house that was then in course of erection. There are four 10 inch, three 9-inch and three 8 inch pipes on the furnace, all covered with asbestos paper and having an average length of about 15 feet, with a pitch of about 25 inches. The top of the furnace is depressed in the center, with a pitch of about 8 inches. The cold air box is 16 x 33 inches and leads from the north, entering the casing of the furnace at the bottom. A cold air pit could not be used, as there are several springs in the bottom of the cellar. When I set the furnace there was only one turn in the cold air box; but this did not suit the owner, who had it changed without my knowledge, so that now it has five turns in it. The chimney is at the center of the house, having one 8 x 12 flue for the furnace and three flues for grates,

and runs out at the peak of the roof. The smoke pipe from the furnace enters the flue at the bottom, with no space between this opening, as all flues should have. When the furnace is run with the drafts open it nearly roasts the people out of the house; but as soon as they close the draft and open the check the fire dies down, and nearly every morning is out and the house cold. Several kinds of coal have been used with the same result. The furnace is large enough for the house, for with the drafts open it will heat the house in a very short time without a particle of the fire pot becoming red hot. I have set 40 furnaces during the year and this is the only one that has given me any trouble. I do not know how to overcome the trouble. There is good draft, plenty of cold air, good elevation to pipes, furnace of ample capacity, three grates in the house, and everything done according to my best knowledge, which has proven successful in all other cases but this. I did not have to make a single change in any of my other furnaces and this winter has tried the best of them. My customer says he will not pay for the work until the furnace works satisfactorily. Before he changed the cold air box the painters that worked in the house before it was occupied only needed to fire it twice a day; now it is fired from five to eight times. Am I still liable for the furnace when the chimney stops at the smoke pipe and the cold air box has been changed? Can I be forced to take the furnace out at my own expense? If I change the cold air box as it originally was and put a stack on the furnace flue and secure successful operation, can I hold him for the extra expense?

Note.—We trust that our readers will endeavor to help this correspondent. It seems to be a clear case of mismanagement of the furnace. If the painters, who had no interest in it, could keep fire by attending the fire twice a day the method they followed will produce the same result again. It would seem that the fire is checked too much, and that more judgment is needed in checking it. The character of the contract will decide some of the questions asked. If the contract was to heat the house, it seems that it has been fulfilled. If the contract was to heat the house satisfactorily, which is a dangerous and unbusinesslike word to use, it will be cheaper to bear some expense than to enter a lawsuit. A decision has been gained in one court, however, where it was held that the word "satisfaction" could not be made to cover unreasonable demands.

Paste for Asbestos Paper.

From J. CALLAGHAN & SONS, *Cleveland, Ohio.*—We notice the letters in *The Metal Worker* from "W. H.," Indiana, Pa., and "J. R. L.," Binghamton, N. Y., on paste for asbestos paper,

and wish to thank them through the Letter Box of *The Metal Worker* for answering our inquiry. We are under the impression, however, that time can be saved in putting on paper on hot air pipes by using a paste of some sort. We have tried the recipes given us by "W. H." and "J. R. L.," but found it to work slowly, so we are sure that a good paste would be an advantage. If we obtain a paste recipe through *The Metal Worker* we will be very thankful.

Is Trap Ventilation Necessary?

From SWIPED JOINT.—Notwithstanding the almost universal opinion of English writers on this subject, I must agree with "A. B. K.," whose letter appears in *The Metal Worker*, March 30, that there is no necessity, except to prevent siphonage. It may shock many very eminent sanitary engineers on this side of the Atlantic, and many intelligent plumbers, too, but after a good many years' experience and observation I am willing to go on record as opposed to it. My observation is that these vent connections sooner or later become broken or loose, in which condition they defeat the object of the trap. As no water is supposed to pass through them they may be loose or broken for years before discovery. Some architects have the idea that if a trap is back vented sewer gas cannot pass the trap, no matter if the water seal has evaporated, and for such reason specify vents. If this was true and could be depended on then I would do away with the trap entirely and back air and vent every waste pipe, for if we can secure a positive down draft through our fixture waste there remains nothing to trap against.

Holes in Copper Tank Lining.

From R. & R., *Hope Valley, R. I.*—Will *The Metal Worker* please inform us what is the cause of a copper tank lining becoming honeycombed or full of innumerable little pits which when very slightly pressed with a pointed tool will make a hole? We were called a few days ago to repair a copper tank, which we found in this condition. The lining is of 16 ounce soft copper, tinned on one side, which has been in use 20 years. The water is rain water taken from a cedar shingled roof. The gutters and conductor are made of tin. In very dry weather water is pumped into the tank from a well. This, however, very seldom occurs, as the tank holds about 22 barrels, which is generally sufficient for the demands made upon it. The tank supplies a copper range boiler and is located about 3 feet above it. The lead pipe leading from the tank to the boiler is 6 feet in length and 3/4 inch in diameter. The relief pipe from the boiler drops into the tank. The water in the tank never gets warm, as the steam or vent pipe from the boiler very seldom overflows. This is a new experience to us; and we would like to know if this condition is often found with copper lined tanks. We

should also like to know how long a 14 or 16 ounce copper lining will last.

Note.—This is not the first time that a complaint of this nature has been brought to our notice. Several years ago a correspondent wrote to us about the trouble he had experienced with the pitting and perforation of copper sheets, and within a week or two a second letter came from another part of the country speaking of the same difficulty. We looked into the matter carefully at the time, and interviewed copper manufacturers and others, without, however, receiving any very satisfactory explanation. It has been suggested that the trouble is caused by the sheets of copper not being thoroughly clean before they were tinned. Little particles of oxide remaining on the sheets are tinned over and start a corrosion, which eventually results in the small holes mentioned. We should be glad to hear from our readers on this subject.

The Quality of Tin Roofs.

From a letter recently received from N. & G. Taylor Company, Philadelphia, we make the following interesting extracts:

The letters appearing in your recent issues in regard to tin roofing being laid at 4 cents per square foot have interested us considerably, and we have simply to repeat that the material must be a very poor grade, as the price of the material alone in the best roofing plate is more than 4 cents per foot.

Your correspondent strikes the key-note of the situation when he says:

"If the better class of roofers would only take the trouble to educate property owners to understand that but a fraction of a cent per square foot exists between a thoroughly reliable palm oil made plate and a plate made by the acid flux, they would appreciate the hint and act accordingly. It would have the tendency to at least lessen the fierce competition, while property owners would be willing to pay a little more for their tin when the result of its use could be clearly shown."

Tin roofing in the United States is in a very peculiar condition and has been for several years past, and no one has watched this transition period more carefully, with more trepidation, than our firm. More attention seems to be given now to the price than to what one is really to receive. This state of affairs, we regret to say, has been gradually going from bad to worse as time rolled on, and year after year the tendency of buyers has been toward still cheaper grades, such as carry from 3 to 6 pounds of coating per box of 10 14 x 20—112 sheets, and to those execrable light weight plates, until it has become an open secret that most of the old standard imported plates that had enjoyed at one time great popularity, are now being brought in as 100 pounds, 80 pounds, 80 pounds, &c., to the box. As regards the better grades, the demand for heavy coated plates and the fact that appearances can be so easily produced in a cheap way have resulted in the market being flooded in a confusing manner with "old method," "old process," "old this" and "old that." In many cases such plates are nothing more or less than acid flux plates made through patent pots and rolls and carrying a heavy coating. Of course no one would expect such plates to wear for

any length of time, because, no matter what the coating is, corruption is going on within, yet they are branded as above and stamped, and the price being below that at which the genuine article is sold, the temptation is too great for the roofer, who, fortified with the recommendation of the seller, puts on the roof at a price that is satisfactory to the property owner and simply pockets the profit. Such plates cannot be expected to wear, and it should be borne in mind that the mere fact of the plate being stamped with the brand does not make it any better. Nor is it to be expected that a roofer should go into the different tin plate works and note the process of manufacture of every plate that he wishes to consider. Nor will many even go into the subject deep enough to consider whether the brand they buy is worth the price asked? What hope is there, then, for a regeneration of this all important trade? Is a forcing process to be put in operation? Must the property owner educate himself and force the architect to so frame his specifications that a roofer is forced to use the brand specified? Or will roofers take it into their own hands and use the best without regard to outer influence? Then, and only then, we claim, will tin roofing be brought back to its proper plane of prosperity and stand where it once did. Then, and then only, will roofs be as good as in the "old time long ago."

Of course we cannot expect to buy wool at the price of cotton, nor can one expect to buy roofing tin that will wear at the price of the cheap stuff that is now being offered, but the best can be had if one is willing to use it. As "Experience" says in your issue of March 9: "Until property owners are taught to understand that cheapness is not the first requirement (in roofing plates, at least) nothing but constant expense and new roofs will be the order of the day, and we will venture the prophecy that if acid flux plates are put on as recklessly in the next four years as they have been in the past, the cheap tin plate will be utterly abolished and a substitute introduced more favorably adapted to atmospheric action and the length of the buyer's purse."

From the above we think that your readers can draw but one conclusion—use the best tin at all times, and when buying it see that it is the best and exactly what is paid for.

From P. H. LAUFMAN, Pittsburgh, Pa.—In *The Metal Worker* of March 9 I noticed the article from "Experience" on the "Quality of Tin Roofing." I was going to indorse it at the time, because it is all true, but I put it off, and now another article from Kentucky induces me to write you, as "facts are facts, Mr. Gradgrind," and those are what we want. I am sure that the results will be as stated by both your correspondents. The cause of pin holes both in bright andterne plates is the result of the acid process, and this should be iterated and reiterated from one end of the country to the other, or as sure as the sun rises and sets the goose that lays the golden eggs will be killed.

How to Put Collars in a Furnace.

From W. H. H., Washington, D. C.—I would like to learn through *The Metal Worker* an easy way to put collars in hot air furnaces when a flaring top is used and the collars are taken from the slide.

How to Make a Boiler.

From L. E. B., New York.—Will some one tell me how to construct a pipe boiler large enough to supply a small horizontal 4 horse-power engine; also how to make an oil burner to heat the boiler? Can I use gasoline for fuel at less expense than kerosene oil? I will be glad to receive information on these subjects through the Letter Box.

Pattern for Milk Can Breast.

From SUBSCRIBER, Garnett, Kan.—I shall be glad to see published in *The Metal Worker* a method of obtaining the pattern for a milk can breast, the one side of which is perpendicular and the other flaring.

Note.—In previous issues of the paper various modifications of this problem have been presented at considerable length, the one exactly meeting our correspondent's requirements being found in the issue for November 17, 1894. We submit the inquiry, however, to our practical readers in the hope that they may furnish other solutions.

Terms of Partnership.

From G. M. H., Delaware—I wish some of the readers of *The Metal Worker* would inform me what are the usual terms of partnership when a tinsmith and plumber places his trade and experience against capital, with a man who knows nothing of the business. 1, What amount of capital equals the labor and experience, and, 2, should the mechanic pay any rent on store, &c., or interest on any borrowed capital in case there should be any? I should be very glad to have any information regarding the formation of a partnership of this kind.

Which is Best for Furnace Tops?

From REVOLUTION, Trenton, N. J.—Answering the letter of "J. C." in *The Metal Worker* March 2, I think that the furnace top has little to do with the trouble and can only give a guess as to the cause owing to meager information given. He is trying to revolve the air in the house, using the furnace to cause the revolution and the result has not been satisfactory. I should expect to find the trouble in the flues leading from the cellar to the upper rooms, as partition flues seem to be the rule throughout the country. I also assume that there is no register in the hall. The partition flues are long and narrow, an improper shape, presenting a great friction and hindrance to air currents, consequently an insufficient quantity of air is delivered in the upper rooms to heat them. As the hall is not heated, or, if I am wrong in this assumption, is not sufficiently heated, the warm air from all the rooms flows into it, leaving the rooms uncomfortable. Under such circumstances a large register in the hall will relieve matters. Where a furnace takes its air supply from a hall if the doors leading into it are closed it will stop the air from revolving to a serious extent, and if there are vents for the air to escape, like a fire place, there must be some means to supply the hall with air to make up the deficiency caused by the escape. By opening the hall door for a few minutes it can be determined if a better flow of air comes from the registers, and if there is the trouble is easily remedied.

PLUMBING and GAS FITTING.

Pratt Institute Trade School.

The evening classes of the 1894-1895 term at the Trade School of the Pratt Institute, Brooklyn, closed their work on Friday, March 29. In spite of the depression which has ruled during the winter in the building trades the number of pupils was well up to the average, showing the appreciation that exists in the trades of the value of the instruction given there. The progress made in all the departments is reported to have been very gratifying. The number of pupils instructed in the various evening classes in the past season was 133, divided as follows:

Plumbing.....	51
Machine shop.....	22
Carpentry.....	19
Fresco painting.....	22
House and sign painting.....	13
Sheet metal pattern work.....	6

The members of the plumbing class were examined at the close of the term by a committee of the Brooklyn Journeymen Plumbers' Association, with the view of awarding diplomas to such as proved themselves properly qualified. The results of the examination have not yet been made public, but they will probably be known next week.

Kansas City Plumbing Ordinance.

Plumbing Inspector Henry Sieben, in consultation with the plumbers of Kansas City, Mo., has prepared an exhaustive ordinance regulating plumbing and house drainage. The ordinance, which aims to revise the plumbing ordinances of the city, will be introduced at the next meeting of the council. Its principal provisions are as follows:

No person shall carry on the business of a plumber or engage in house drainage without being licensed; such persons must file a bond for \$1000 with the comptroller and deposit \$50 with the treasurer, the deposit to be used in repairing any damage to the streets or alleys not repaired within 24 hours after the superintendent of streets has notified the plumber to do such repairing; permits must be issued by the inspector of plumbing for all digging in the streets; proper protection in the shape of barricades and red lights must be afforded when any street is dug up; all drain and soil pipes shall be of cast iron, securely ironed to the wall, carried out through the highest point of the building, and each house drain shall be provided with fresh air inlet; a gresse trap must be provided for hotels, restaurants and boarding houses, where cooking is done for more than 30 people; all plumbing must be inspected by the plumbing inspector; bathtub waste pipes shall not be connected on the house side of a closet drain; every building must be separately and independently connected with

the main sewer 5 feet outside the building line; the mayor shall appoint one master plumber and one journeyman plumber, who, with the plumbing inspector and superintendent of buildings, shall constitute a board of survey to examine all applicants for a plumber's license; a license shall cost \$15, to be equally divided between the two non-salaried members of the board; but if the applicant is rejected \$5 shall be returned to him and the \$10 divided, but all master plumbers in business at the passage of the ordinance shall be required to pay only \$1 license if they apply within two weeks after the ordinance is passed; no vault shall be built in the closely built up portion of the city where connection with a sewer can be secured, and in no event shall any vault be built within 10 feet of an adjoining building used for human occupation; all plumbers making connections with sewers shall report the same to the city engineer within five days after the work is completed; no connections to manholes shall be made at the upper or dead ends of any sewers; a fine of from \$25 to \$200 is fixed for violations of the ordinance, and the plumber so violating shall forfeit his license for one year.

Draining Plumbing Systems.

From O. C. N. Camden, N. J.—In answer to "G. D. B." in *The Metal Worker* March 16, would say that very few plumbing systems around here are arranged to be drained to prevent freezing over night, though most of them have a stop and waste cock on the service just inside of the cellar wall. In some cases I have put a hose cock in the service pipe near the stop and waste mentioned, and made the pipe at this cock the lowest point in the whole system. A hose can be attached to the cock, and when the service stop is closed and the hose cock is opened the hose is carried to the cellar drain, where the water runs off. In one case I connected a lead pipe, with a stop cock on it, direct from the service pipe to the horizontal soil pipe, bending the pipe to make an S-trap with a seal 2 feet deep. None of these arrangements have been used except in case of repairs or when the house is to stand uncoccupied for a time. Though our climate is more severe than the Southern climate our plumbing work does not freeze except where it is exposed to an outer wall that is thin.

Essays at Plumbers' Conventions.

A correspondent writes us, says the New Haven Record, in regard to the presentation of essays to the conventions of the Connecticut Master Plumbers' Association as follows:

I think it is to be deplored that so little time and attention are devoted to this important source of intellectual and scientific advancement, which, in my opinion, should not be displaced by the windy orations of "walking delegates," or after dinner frivolities. I regret the necessity of this criticism of the direct-

ors of our annual conventions, but I believe that its sessions should, in the main, be devoted to the consideration of topics pertaining to the interests of our profession which have received thought and preparation in advance, and should not be wasted on extemporaneous discussions on general questions. An effort has been made to materialize this idea, but members are unwilling to spend time and thought, to be ignored for other less profitable entertainment.

Overflow and Strainer, with Clean Out Screw.

C. A. Blessing, Philadelphia, is introducing the overflow and strainer shown in the accompanying cut. It is made of brass, in polished or nickel

Overflow and Strainer with Clean Out Screw.

plated finish and suitable for use on any style of tub, open or closed. The screw or plug seen on the body of the overflow is removable and permits of straight access to the overflow pipe for clean out purposes. In this way hair and other matter escaping from the bath through the strainer may be removed with little difficulty and the pipe kept thoroughly clean. The article is patented and is made in the usual size, 1½ inches, both for lead and iron pipe.

To Prevent Kitchen Boiler Explosions.

From SAMUEL HEINS, Rondout, N. Y.—I have been asked so frequently how to avoid the danger of boilers exploding that I have answered I would endeavor to give them the necessary information through *The Metal Worker* and have advised the inquirers to become subscribers to such a valuable paper for all kind of information relating to plumbing, steam and hot water heating, ventilation and tin, sheet iron and copper work. In former years when *The Metal Worker* was first published and since then it has enlightened many a fellow workman in those branches of business. I have written many letters to the paper when it made its first appearance and I must state it was through me that the first plumber's gasoline furnace was introduced to its readers. I am always glad when the time arrives for the next edition and

now I will proceed on the dangers connected with the range boiler and how to avoid them. It is not an uncommon thing to hear of the explosion of the range boiler with more or less disastrous results. Numerous cases of death are reported and serious scaldings and much wreckage of dwellings. The only wonder is that there are not more of these accidents when one considers the extremely careless way in which many boilers are put up. A very hot fire is made, the water reaches a tremendously high temperature and generates steam with a pressure sufficient to run a small engine. Added to this is the pressure from the mains and a source of great danger is present in the household. Every kitchen boiler should be provided with a valve or an escape pipe of some sort. One of the best arrangements of this kind ever devised was some years ago put into a house with a tank supply and it has worked so well that none of the so-called scientific improvements have been welcomed to displace it. A small pipe is carried from top of the boiler to the top of the house. Here it makes an abrupt turn, going down again to the tank in the bathroom. A smaller pipe is attached at the highest portion on the bend and this runs out at the roof by the side of the bathroom ventilating pipe. This house is so situated that the pressure is usually heavy and this device was adopted because a very strong valve must be used, too strong to be safe under ordinary circumstances, as the water would be forced through the escape pipe. As at present arranged the waste water which goes up through the pipe returns to the bathroom.

It has for a long time been held by some plumbers that there are obscure reasons of some sort why boilers explode. Experiments have proved that there are simple, natural laws that operate in these cases. There is no unknown and dangerous gas, as has sometimes been stated, but there is almost a certainty of an explosion when the pipes have become empty and are heated red hot then deluged with cold water suddenly let in. Every boiler should be provided with safety valves and escape pipes. The valves should be so situated that they can be examined, and this should be a regular duty of the careful housekeeper. In view of the dangers that attend the use of hot water, especially where the pressure from the mains is variable, or when one must depend upon water pumped into a tank, it would be an excellent idea to adopt a section of the supply pipe of glass, the same as the water gauge on steam boilers, or some indicators could be so situated that a lack of water would immediately give notice in some unmistakable way. Then, when indicators, valves, steam pipes and drain ways have been provided it should be the special business of some competent person to overlook these appliances at least once every week.

TRAPS AND VENTS.

H. H. LOWE has bought out the plumbing business of George McLeod, located on Mechanic street, Clinton, Mass., and is removing all the fittings to his residence on East street, where he will continue the business.

A new plumbing business has been opened by A. F. Mayhew on Lowell street, Peabody, Mass.

JOHN WALKER and EDMUND A. MORRIS have made arrangements with the Hotel Cadillac, Detroit, to hold the

next convention of the Central Supply Association there on Monday and Tuesday, June 10 and 11. On Wednesday the guests will be given a yacht ride on the river, and wind up with a dinner at the Rushmore Club, at the Flats.

THE AURORA IRON WORKS, Aurora, Ill., have issued a neat little pamphlet descriptive of the Bignall patent Peerless stop cock box, and containing cogent reasons why it should be adopted by plumbers, which are backed up by numerous strong testimonials.

A CIVIL SUIT has been brought at New Bedford, Mass., by a man who built a house against his plumber. The owner claims the specification called for 4-inch soil pipe to provide for water closets which were to be put in later. The plumber maintains that the specifications did not call for any given size pipe, and there being no closets in the plan, he used 3-inch pipe. Now the owner wants to put in closets, and finds the Board of Health will not let him without using 4-inch pipe, so he sues the plumber to compel him to change the pipe or pay for such changing, amounting to about \$200 in expense.

THE PLUMBING SHOP of John Hawtree, at Englewood, Ill., was destroyed by fire last week.

A. B. KINGSLAND, who recently sold out his plumbing business to the G. S. Blodgett Company, Burlington, Vt., will not leave the city, but has engaged with the Blodgett Company for the coming year.

S. W. HOTCHKISS has opened a plumbing establishment at 11 Dwight street, Springfield, Mass.

E. S. GRAY has opened a plumbing establishment at Fairfield, Conn.

H. O. TAYLOR will open a plumbing establishment in Danbury, Conn.

HAYES & ROURKE, New Haven, Conn., are to build a three-story building with two stores and dwellings. One store will be fitted for their plumbing business as a showroom, with a shop in the rear. Two hot water heaters will be used for the heating.

PETER HANSEN, Superintendent of Highways and Water Works at Rhineland, Wis., adopted what proved to be an efficient method for preventing the water pipes freezing during the cold weather of last winter. His method consisted in feeding live steam into the mains at the pumps at the water works and so raising the temperature of the whole water supply sufficient to keep it from freezing, even where the frost had penetrated below the pipes. There are $7\frac{1}{2}$ miles of mains in the system and through the use of steam the temperature of the water was raised from 33° to 39° .

JOHN GIBBIE has been granted a plumber's license at Jacksonville, Fla.

THE JOURNEMEN PLUMBERS of Portland, Ore., made a complaint to the Board of Health against the use of rubber connections on the flush pipes to water closets, which was promptly dismissed as unreasonable.

CAWLEY & TROW is the name of a new firm of plumbers who have begun business in the Hawkes Building on Washington street, Marblehead, Mass.

R. S. SHOLES, JR., 185 Franklin street, Norwich, Conn., is fitting up a modern plumbing showroom. He has just put in new iron enameled bathtubs, the latest improved hot water boilers and laundry tubs. Mr. Sholes is a

graduate of the New York Trade School.

COMMISSIONER EMERY, Brooklyn, has announced the appointment of the following inspectors of plumbing: Francis J. Foley, 470 Sackett street, and James O'Connell, 396 Bergen street.

WILLIAM MALTEY, Stoughton, Mass., has purchased an interest in the hardware and plumbing business of A. H. Linton.

ORDINANCE 590 has been passed providing for the government of and directing the duties required by the city of Altoona, Pa., to all plumbers doing business in the city, with penalties as set forth, and defining the powers of the water commissioners and the authority of the superintendent of water.

THE PLUMBING ESTABLISHMENT of Johns Bros., Scranton, Pa., was visited by fire last week.

THE INSPECTORS OF PLUMBING as appointed by the Board of Health of Amherst, Mass., are L. W. Banning and E. I. Bangs.

THE ALBERENE STONE COMPANY, 217 Lake street, Chicago, are to remove their warehouses from Jackson street to the building at the southwest corner of Monroe and Clinton streets.

The following plumbing firms have lately started business in Chicago: Edward H. Palmer, 3847 State street; Mulcahy & Co., 6736 South Halsted street; Reiny Van Doyle, 8223 Emerald avenue; Macauley & Mayer, 234 Mulhawk street.

THE GUBEEN STRAUS PLUMBING COMPANY have been incorporated at St. Louis, Mo., with a capital stock of \$5000, one-half paid. The incorporators are John Gubeen and Gustave Strauss, each of whom owns 19 shares, and W. D. Quigley, 12 shares.

F. M. BORDEN & BRO., 118 North Second street, Philadelphia, are sending a typewritten circular letter to the plumbers in their vicinity calling attention to their line of Reliable gas ranges and gas cooking goods, which, it is said, has elicited considerable interest.

MAYOR, LANE & CO., 128-132 White street, New York, are in line with a series of siphon jet closets, under the names of Puritans and Priscillas, which they claim are reliable and prompt in action and noiseless. A sectional view of their Puritana closet in a circular they are distributing shows that it stands $15\frac{1}{2}$ inches high, and the extreme distance from the wall required is $23\frac{1}{2}$ inches, with a distance of $11\frac{1}{2}$ inches from the wall to the center of the outlet to the soil pipe.

THE GILBERT & BARKER MFG. COMPANY are established in their new quarters at 82 John street, New York. The company make a special display of their gas manufacturing and cooking appliances. They have placed one of their gasometers under the sidewalk, and in the cellar they have an air pump and regulator. With this apparatus gas is manufactured for showing their line of cooking apparatus and for lighting their store. Several Welsbach burners are attached to their fixtures, and the store is as brilliantly illuminated as if an arc electric light was used. Along one side of the showroom they have arranged their Springfield gas machines, which are used to manufacture gas for residences situated where there is no gas works to supply consumers. Opposite them is shown a

line of Clark's Jewel gas ranges, hot plates, broilers and appliances. A notable exhibit is Clarke's instantaneous water heater. This apparatus rests on a bracket on one side of the showroom, and is connected with the water service pipe of the building, the outlet running to a lavatory on the opposite side of the building. A pilot light burns continuously under the water heater, and on opening the faucet at the lavatory the flow of water to it operates a valve at the water heater, which opens a gas valve and supplies gas to the burner under the water heater, which is lighted by the pilot light, and as soon as the cold water in the pipe between the heater and the lavatory is run off hot water runs continuously as long as the faucet is opened. This exhibit is a novelty and shows a device in operation which seems to be widely applicable for household use and for the lavatories in office buildings. All the appliances on exhibition are using gas made from their Springfield gas machine in the cellar, although in the heart of New York City.

THE PLEUGER & HENGER MFG. COMPANY, St. Louis, Mo., have issued their No. 7 plumbing and water works catalogue, which is a volume well bound in cloth, measuring 7 x 10 inches in size and containing 174 pages. In handing to the trade this revised catalogue of plumbing and water works specialties the manufacturers call attention to the lines which they have added and not heretofore illustrated. Following an alphabetical index which begins the book, the first section is devoted to service boxes, valve boxes, gate valves, hydrants, street washers, hydrant valves and hose valves, stop and waste valves, &c., to which some 60 pages are devoted. Next comes a line of brackets of various designs and sizes. This is a line to which the manufacturers particularly allude and it will be of much interest to the plumbing trade. The first goods, known as antique pattern, are of elaborate design. A variety of new patterns in brass follow, some of them being exceedingly neat and tastefully designed. The line includes brackets for a variety of purposes, including closet tanks, sinks, &c. After this comes a large assortment of legs for lavatories, closets, wash trays, &c. Brass pipe is another new feature of the book, and one page is devoted to an illustration of the National trap, made of brass. This is followed by globe traps, S-traps and combination traps, towel racks, &c. Lawn sprinklers come next; then a variety of special goods such as combination sinks and traps, sinks, drinking fountains, cesspools, ceiling plates, &c. Stop cocks, bibbs, stops, cocks, and combination cocks are illustrated in the greatest variety of patterns and styles and the extent of the line may be understood from the fact that some 60 pages are given up to this assortment.

IT IS REPORTED that S. L. Boggs, Allegheny, Pa., is looking for a site to manufacture enameled bathtubs and plumbers' goods.

B. FRANK HOOPER, president of the Colwell Lead Company, 63 Centre street, New York, has sailed in the steamship "Fulda" for Gibraltar. Mr. Hooper proposes to be absent for about two months. His tour, which is undertaken purely for rest and recreation, will include Gibraltar, Algiers, Naples, Rome and other Italian cities, from whence he will return by way of Paris and London. This is the first occasion on which Mr. Hooper has crossed the

Atlantic or taken any very extended holiday. His friends hope to see him return greatly benefited by the change of scene and interests which he will find on the European continent.

S. H. MORGAN & Co. have purchased the plumbing, steam and hot water fitting business of W. I. Bolt, 1191 Jefferson avenue, Detroit. Mr. Morgan has been with the Detroit Heating & Lighting Company for the past five years, acting in the capacity of secretary of the company. They report the business outlook very bright.

L. R. CHURCHILL, plumber, of Brockton, Mass., has formed a partnership with Wm. S. Washburn of Wollaston, and in future the business will be conducted under the firm name of Churchill & Washburn. Mr. Washburn graduated from the mechanical engineering department of the Worcester Polytechnic Institute, class of 1882, and since that time has been engaged in engineering and manufacturing work.

BREEN BROS. have opened their newly refitted store, 213 Genesee street, Utica, N. Y. They will occupy the entire building. In their showroom they will carry a complete line of fine plumbing goods, steam and hot water heaters and one of the largest exhibits of stoves in Central New York.

A Few Hopeful Indications.

It is an agreeable relief to note an occasional tendency to better business conditions, says *The Iron Age*. For many weary months hardly a break occurred in the publication of dismal chronicles. Wages were being reduced, prices were falling, factories were closing, railroad earnings were decreasing, and the whole commercial world was in a state of almost hopeless resignation to an indefinite continuance of poor trade. Credit had received so many staggering blows, one after another in quick succession, that confidence seemed to be a lost trait in suffering humanity. But as the longest and worst winter in the memory of any one living has now run its course, so also has the severest depression in the business experience of the present generation about terminated its wretched career. And now, instead of a daily report of discouraging and calamitous events, we are steadily being treated to a stream of incidents of a hopeful character. These are not yet so exceedingly good as to demonstrate the complete recovery of trade. Here and there are to be found unpleasant reminders of our still unsettled and perturbed condition. Some unexpected failures have quite recently taken place, and in a few trades it seems that the unpleasant necessity exists of further reducing wages. But these are only ripples on the broad stream of the nation's commerce, and its generally placid condition is in sharp contrast to its recent storm-tossed state. A few of the evidences of improvement are decidedly worth noting.

Perhaps the most cheerful indication to be found in the whole horizon now in view is the advance in wages recently granted to Western Pennsylvania coal miners and coke workers. Even if the advance in the one case was secured by a strike of gigantic proportions, and in the other case was due to special causes yet to be disclosed, nevertheless the advance thus made is a very important and deeply significant fact. It is years since employers have seen their way clear to mark wages up in

any branch of trade whatever. The tendency has been downward and very strongly downward. That tendency has not only been checked, but a distinct gain has been made in the other direction in the case of not merely a handful of men, but many thousands. It may be found after due trial of the higher schedule of wages that the advance was premature and that the general condition of trade did not warrant it, in which case a reduction may again have to be made. But let us hope that this will not occur. It would be far better for everybody directly interested, and vastly better for the entire country, if the example thus set in the coal and coke trades can shortly be followed by an improvement in the wages paid in other industries. The magnificent prosperity of America in the golden past was due to the purchasing power of the American masses, which was unequalled in any other country on the face of the globe. Better wages, if attended with full employment, will restore those halcyon times.

Another indication of improvement, although it may be regarded as of a negative character, is the stubborn resistance to further concessions which is manifested by many manufacturers. It is no longer easy to induce a manufacturer to discount his bottom price. The limit of endurance has been reached, and the gradual increase in consumption forms at last a basis on which to rest a stand for better prices. If this is once established so that buyers are convinced of it, a general movement to stock up may be expected, and the country is so bare of stocks of manufactured goods that even a moderate impulse in this direction cannot fail to exert a mighty influence along the whole line. The West is particularly short of stocks, as shown by the urgent demand for prompt shipment whenever orders are placed, and it would not be surprising at any day to find the buyers of that section taking all kinds of goods with something like their old-time vigor. Reports from the most impoverished districts, sorely stricken by drought last year, state that the people are bravely making preparations for the coming year's battle with nature's forces, and that they have every reason to expect their labors to meet with success. If they do but fairly, other parts of the West will do grandly, and heavy business will again rejoice the hearts of the managers of the great east-and-west lines of railroad. But it is by no means an insignificant fact that the earnings of some of the greatest of these systems are even now increasing. The opening of spring has quickened the energies of the people, and the general resumption of outdoor operations has necessitated the movement of much material, creating a traffic that may continue of goodly proportions until the crop movement begins.

Bids are invited at Norman, Oklahoma, until April 15, for furnishing a quantity of 4 inch cast and wrought iron pipe, hydrants, &c.

Work at the Great Western Pottery, Kokomo, Ind., has not been interrupted to any appreciable extent by the recent strike of the operative potters at that place. A sufficiency of men has been readily obtained to fill the places of the strikers.

Exports of galvanized iron from the United States to Canada have shown a considerable increase lately.

TIN PLATES.

Quarterly List of American Tin Plate Works.

With the object of furnishing to the tin plate trade and to consumers of tin plates generally the latest and most accurate information obtainable in regard to the status and products of the domestic industry, we began, in July of last year, the publication of a periodical list of American tin plate manufacturers and their brands. A similar list, corrected to date, has since then been printed in the first issue of *The Metal Worker* in each quarter, and has been received with many expressions of favor by our readers. Following this custom we present herewith the fourth of these lists. In some respects the present one is fuller and also more interesting than any that have preceded it.

Attention is specially called to a new feature introduced in the present exhibit, namely, the numbers of black plate mills in existence, in operation and building. The statistics furnished under these headings will enable our readers to form a good estimate of the capacity of the existing domestic tin plate works, in arriving at which the number of tinning sets possessed is of course no guide. The names of several new firms will be found on the present list, while those of a few concerns, which have fallen out of the race in the past quarter, have been dropped. The list includes every firm in the United States now making or about to make tin plates or black plates for tinning.

Tin Plate and Black Sheet Imports.

The complete returns of imports into the United States for the fiscal year ended June 30, 1894, just issued by the Bureau of Statistics at Washington, contain the following information in regard to the amounts and values of tin andterne plates and black sheets entered for consumption during that period:

The imports of tin plates amounted to 454,159,826 pounds, or rather more than 4,000,000 boxes, calculated on a basis of 112 pounds to the box, the following being the principal ports of entry: Baltimore, 65,771,999 pounds; Boston, 19,762,484 pounds; New Haven, 1,116,188 pounds; New York, 189,581,807 pounds; Philadelphia, 77,576,622 pounds; Portland and Falmouth, Maine, 3,769,614 pounds; New Orleans, 3,645,099 pounds; Oregon, Ore., 2,235,360 pounds; San Francisco, 36,385,077 pounds; Willamette, Ore., 1,572,698 pounds; Buffalo, 1,906,480 pounds; Chicago, 26,320,578 pounds; Miami, Ohio, 1,043,590 pounds; Milwaukee, 4,073,493 pounds; Minnesota, Minn.,

1,534,677 pounds; Cincinnati, 1,721,311 pounds; Kansas City, 3,865,080 pounds, and Omaha, 4,215,473 pounds.

It is interesting to note that the total imports of the Pacific Coast, therefore, footed up to 40,716,041 pounds, a trade which the American makers will find it hardest to wrench away from their Welsh competitors.

During the fiscal year under review duties were paid on 436,780,713 pounds of tin plate, of which 426,739,364 pounds were lighter than 63 pounds per 100 square feet.

The imports of black sheets and taggers valued at 3 cents per pound and thinner than No. 25 gauge footed up to 2711 net tons. Cold rolled sheets thinner than No. 25 gauge, which constitute the raw material of the tin dipping industry, were imported to the extent of 25,181 net tons. Of sheets pickled and cold rolled the imports between the gauges Nos. 20 and 25 were 614 net tons and below 25 gauge 2462 net tons. Galvanized sheets figure to the extent of 428 net tons. Planished sheet iron is down for 548,087 pounds, valued at \$27,650.

Treasury Rulings.

Acting Secretary Wike of the Treasury Department has made a ruling of importance concerning tin plate. In a letter to the Collector of Customs at Halifax, Baltimore, Md., he sets forth the decision, as follows:

"The Department is in receipt of your letter inquiring at the request of Ammidon & Co., of your city, whether strips of tin plate collected at Halifax, Nova Scotia, from manufacturers of tin cans may be imported into the United States as 'waste' subject to duty at the rate of 10 per cent. ad valorem, under Paragraph 362 of the act of August 28, 1894. Upon an examination of the sample of strips submitted it appears that they can be used without undergoing any intermediate process of manufacture for many of the purposes for which entire tin plates might be cut into strips, and that while such strips are no longer strips within the meaning of Paragraph 121, they still retain much of the character of an article manufactured for definite uses. The Department, therefore, concurs with yourself and the United States Appraisers at New York in the opinion that said strips are provided for and should be classified as manufactures of metal dutiable at the rate of 35 per cent. ad valorem under Paragraph 177, and not as waste not otherwise provided for mentioned in Paragraph 362."

THE AMERICAN TIN PLATE COMPANY, Elwood, Ind., are distributing among the trade a card bearing on the back their advertisement together with a number of details in relation to their works. On the face of the card is a map of the Central States, showing the location of the company's works at Elwood, and of their sales office at Cincinnati.

SCRAP.

TO A REPORTER of the *Cleveland Leader*, A. M. Britton, treasurer of the Britton Rolling Mill Company, Cleveland, Ohio, stated that although the company have only recently started, the tin mill having been put in operation this month, they have already received a large number of inquiries and are booking many orders, far more from the very start than they expected to have to fill, notwithstanding that the plant is too new to have the prestige of much advertising. The Britton Rolling Mill Company bought out the plant and good will of the late Cleveland Tin Plate Company.

IN ORDER to meet the growing demand for their continuous roofingterne, the American Tin Plate Machine & Mfg. Company, Linfield, Pa., are adding two more Buckman tinning machines to their equipment, making six in all.

MEURER BROS. COMPANY, Brooklyn, N. Y., are receiving congratulations over the report of the expert appointed by Mayor Schieren of that city, to investigate alleged defects in the roof of the Thirteenth Regiment Armory. The expert, Mr. Orth, exonerated the Meurer roofing tin used on the armory from any responsibility for the leakage complained of.

ALL the heavy machinery for the new National Tin Plate Works, Anderson, Ind., has been placed in position. Work is being rapidly pushed to complete the plant, which, it is expected, will be in operation in the course of next month. When completed, the plant will, it is stated, furnish employment for several hundred persons.

THE ATLANTA STEEL & TIN PLATE COMPANY, Atlanta, Ind., commenced operations last week with 200 men employed and a full complement of orders on their books.

THE FALCON TIN PLATE & SHEET COMPANY, Niles, Ohio, have begun tinning their own black sheets. They have at present six tinning sets under way and purpose increasing their complement to 12 in the near future. A circular issued by the concern gives a list of their product in tin andterne plates, which includes four grades of bright charcoal, one of coke and six ofterne plates. The works of the company are equipped with the most modern and improved machinery and are designed to turn out a very high quality of material.

THE OFFICES of the Etna-Standard Iron & Steel Company, Bridgeport, Ohio, which were badly damaged by fire some time ago, have been repaired and refurbished, and the firm again took possession of them last week.

THE following well known members of the tin plate trade were elected this week on the Board of Managers of the New York Metal Exchange: Spencer A. Jennings of Bruce & Cook, W. H. Wells of Robert Crooks & Co., and Charles S. Trench of C. S. Trench & Co.

STEAM AND HOT WATER.

Trouble with Steam Mains.

From S. B., Dalton, Mass.—With a one-pipe steam job, with all the pipe properly pitched to drain the water from the radiators, and the valves on some of the radiators shut, what causes the water to collect in the pipe from the main to the valve on the radiator closed off? Also, what causes the water to rise in the boiler when one or more of the valves on the radiator are opened? Why does a pipe from the main to a radiator become cold when there is no collection of water in it? I should be glad to hear from the practical readers of *The Metal Worker* on this subject.

Note.—We hope our readers will respond to this request for assistance. It would seem that the steam valve did not close effectually and permitted a small quantity of steam to pass the radiator, where it condensed and returned to the branch pipe. It is possible that the water is held in check in this branch from the fact that the steam main is not large enough to permit a return of the condensation when steam is flowing through the pipe. On opening the valve on a radiator the steam will flow into the pipe and equalize the pressure on both sides of the water that has been held in check when it would return to the boiler, and if of any considerable quantity would cause a change in the water line. The pipe which remains cold when there is no water in it has probably an accumulation of air in it which will not permit the steam to enter and warm it.

The Invincible Boiler.

A new sectional boiler has been tested during the past winter by John A. Scollay, 74 Myrtle avenue, Brooklyn and 89 Centre street, New York, and is now being put on the market under the name *Invincible*. The accompanying illustration shows a sectional view of the boiler. The boiler is composed of a front and back section, with intermediate sections with which it can be made in different sizes. The water leg of the section is made in a half circle so as to expose the greatest amount of surface to the fire. The intermediate sections are arranged so that the products of combustion pass to the back end of the chamber, where they rise and, through flues arranged in the sections, come to the front of the boiler, where the smoke outlet is placed. When desirable the smoke outlet can be placed at the back of the boiler and the products of combustion made to come to the front and then pass back to the outlet. Suspended from the intermediate sections are drop tubes so constructed that the water from the section passes down a tube inside of the outer tube, and then passes up against the fire surface to the section, being discharged into the sec-

tion at a point higher than that at which it is received. By this construction an exceptionally large fire surface is secured, and at the same time a large combustion chamber provided. The surface of the sections exposed in the flues of the boiler are of the half circle character to increase the surface, and the flues can be readily cleaned through the large doors provided for the purpose. The boiler is provided with a shaking grate, the grate bars resting in pockets made in the side of the water leg. The grate is so arranged

They are heavy, and have a sufficient taper to prevent them bursting. It is claimed that the tubes have been filled with water and exposed this winter so that they were frozen solid; when it was found that the inner tube lifted and that no damage was done to either the inner or outer tubes. A lift draft damper is provided both at the ash pit and at the smoke outlet, and arranged for attaching to an automatic damper regulator. The sections are so constructed that the flow header may be connected at the top of the sections or

The Invincible Boiler.

that by attaching the shaking lever at either the right or the left side each alternate grate bar is shaken. This relieves the grate apparatus of the severe strain, and thoroughly clears all parts of the fire. The entire grate may be removed or replaced through the fire door. The feed door, which is partly shown in the picture, is said to be exceptionally large to facilitate firing. Above the feed door is another wide door through which access is gained to the drop tubes, and through which a brush may be inserted to clear them of any accumulation. The drop tubes have been specially constructed to overcome any trouble from freezing.

from an opening at the side of the sections immediately at the top, by which several inches of pitch may be gained for the piping in low cellars. When the flow header is on the top of the boiler, it is 5½ inches in size; when one is arranged on each side, they are 3½ inches in size, and are arranged for as many openings for branch mains as are desired. The boiler is made in several sizes ranging from 6 to 14 sections, and rated to carry from 1500 to 3000 feet of radiating surface. The fire surface is 26 inches in width; and in a six-section boiler is 36 inches long. In the larger boilers, a bridge wall arrangement will be used to limit the size of

the fire chamber to the proper dimensions. It is pointed out that very little difficulty will be found in increasing the size of the boiler in cases where it may be necessary. The flow main headers can be furnished for using wrought iron pipe, or for using cast iron pipe such as is used in greenhouse heating.

Bishop's Ceiling Plate.

The accompanying illustrations explain the appearance and use of Bishop's ceiling plate, made by A. T. Bishop, Southington, Conn. Fig. 1 shows the whole plate and Fig. 2 shows about one-third of the plate applied to a ceiling where there was a molding, and the pipe came so that it had to be cut back into the molding about half way. This illustration is made from a plate in actual use. The claim is made for the Bishop ceiling plate that it can be very easily applied. It is made from sheet steel, and if the pipe comes too close to the wall, as often happens, and there is no room for a plate, it can be cut with a tuner's shears and any part of the plate will stay in position as well as a

Bishop's Ceiling Plate—Fig. 1.—General View of Plate.

whole one. No tools are needed in applying the plate, it being simply sprung over the pipe one side at a time. This can be done at any convenient distance down from the ceiling and then pushed up into position. The spring which encircles the pipe is $\frac{1}{4}$ inch wide, and also forms a collar, and it is said that the great friction prevents its slipping

Fig. 2.—Use of Plate Against Molding.

down or crawling. Another point to which the manufacturer alludes is that the plate will answer for a floor plate and the dealer has only to carry half the stock. It is described as very low in price and of neat appearance.

Electric Heating at the Vaudeville Theater.

Crompton & Co. of 148 Brompton road, S. W., says *Industries and Iron* of London, have recently carried out the electrical heating of the Vaudeville Theater. At first it was contemplated to use a system of hot water heating, but, after carefully considering the matter, the management decided that electrical heaters afforded a more advantageous system. Twenty-two "box" or wall radiators and four large portable

radiators, all of the Crompton-Dowsing type, are employed, and they answer the purpose admirably. The temperature of the theater is maintained at 60° , while the corridors may be as low as 40° . The heating arrangements are under absolute control, and any portion may be turned off or on at will. The

Electric Heating at the Vaudeville Theater.

electricity used is taken from the Charging Cross & Strand Electricity Supply circuits, and charged at 4 pence (8 cents) per unit, and when all the apparatus is at work nine units are consumed per hour. With electrical radiators there is no danger of fire, as there is no combustion, and the temperature is about the same as that of hot water pipes. The electrical cables are of Henley's highest quality, switches, cut outs, safety connectors, &c., of the best, and Messrs. Crompton have endeavored to make this pioneer installation complete in every respect. Some difficulty was at first experienced with regard to the Fire Office and London County Council, but all authorities appear now to be convinced that electric heating, when properly installed, is very safe, and perfectly suitable for public buildings. It is stated that electric radiators are often used in an auxiliary sense where sufficient heat is not obtainable in buildings heated by hot water. They are also useful for chilly evenings, and at times when it is not cold enough to work the whole system of heating, but a little warmth is required in any particular room or portion of a room. The illustration shows a portable electric radiator of the type usually supplied.

A High Pressure Job.

S. M. ART.

He wanted to talk, and as his card proclaimed him an expert I concluded to listen and learn. He said that when he was superintending the installation of heating plants where their boiler was used he always made the pipe fitter "screw 'em up tight." One time a man doubted that the job would stand power pressure and rather sneered at house heating steam fitters. Then just to show him what their work would stand he fired up. The conditions were just right—the chimney had a roaring draft and the blooming chump had a bin of Cannel coal for his grate, so he soon had her blowing off. But as that only took 10 pounds, he got a big "nigger boy," who had been a laborer on the job, to

sit in a sling hung on the lever of the safety valve, but even though he weighed 130 pounds that didn't keep her closed. He then got a 3 x 10 joist and put one end against the joist and rested it on the lever and made the boy get on the other end. Well, that joist must have weighed about 40 pounds, and altogether he calculated that he had 170 pounds on the job, but even then it kept the "nigger" bobbing as if he was on a seesaw. When he got that far I said, "You don't say so." He said, "Ah, yes; and that skeptic went right away perfectly satisfied." I would have gone, too, if I had been there. I put the pressure to him to educate me more, but he went to attend to some pressing business. I'll bet that if he didn't blow off once in a while he'd accumulate pressure enough to bust—no, burst. Well, I don't know which is right; bust is most common, anyhow. I mean explode.

Western Tube Company's Hot Water Radiator Valve.

The accompanying illustration represents a cross section of the new hot water radiator valve manufactured by the

Western Tube Company's Hot Water Radiator Valve.

Western Tube Company, Kewanee, Ill. It is a quarter-turn quick opening valve, which does not stick. Referring to the lettered parts of the cut, A represents the valve seat in the stem, held tightly in place by the spring washer B, so that the valve can be packed while the water is in the radiator. C represents the stem attached to the center of the disk and not to one end, thus giving greater strength. These valves are made in five sizes, ranging from $\frac{1}{4}$ inch to 2 inches, with rough or finished bodies, plain or plated. The manufacturers state that the valves have given excellent satisfaction, overcoming the objections to hot water valves in general use. They are prepared to furnish the valves to the trade in large quantities.

The Morrin Packingless Valve.

The McNab & Harlin Mfg. Company of 56 John street, New York, are putting on the market a packingless valve embodying several new features. The

The Morrin Packingless Valve.

valve is made in two styles, one being provided with the Jenkins seat, as illustrated in the accompanying perspective view, which is partly broken away through the body in order to show the entire construction. In the other form the main valve is shaped as a double cone, so that when one side becomes worn out it may be reversed without trouble, practically doubling the life of this part of the valve. Referring to the upper part of the engraving, it will be noticed that the spindle in its central portion is made conical, and that the upper part of the spindle is surrounded with a spring, the tendency of which is to lift the spindle and keep its conical portion constantly in contact with a corresponding conical seat. By reason of this construction the valve requires absolutely no packing, and the conical portion of the stem in its seat, by the mere fact of the operation of the valve, is kept truly in metallic contact. If fact the longer the valve is in operation the tighter the contact between the conical parts. The lower part of the stem is made square in cross section, and this square part enters loosely into a corresponding recess formed in the valve proper. The upper part of the valve is threaded to fit a corresponding thread in the top of the cap, as shown. From this it will be readily understood that as the stem is turned it will also turn the valve, which will be raised or lowered by its thread according to the direction in which the same is moved. The valve stem, spring, upper bonnet and upper valve seat may all be taken out of the valve for repairs or renewal without shutting off the steam from the pipes, by either first opening the valve to its full extent or closing it. As the stem is made short the contraction of the spindle is avoided and the danger of the lifting of the disk from its seat and consequent leaking are avoided.

The Ornate Low Radiator.

A new radiator that has recently been added to the line manufactured by the United States Radiator Company, Saltburg, Pa., is shown in the accompany-

ing picture. It is specially designed for use where a low radiator is required, as it stands but 23 inches high, adapt-

Canadian Steam Heating.

A recent and instructive experience with a steam heating plant, says the *Canadian Architect and Builder*, is reported in connection with one of the Toronto public school buildings. Last summer the Bolton avenue school, a two story building, was enlarged to contain 16 class rooms instead of 12. This was done by adding a third story, making an increase of 50 per cent. in the space to be heated. The apparatus formerly consisted of one boiler and plain coils of steam pipes—the usual pressure of steam running at 6 to 8 pounds gauge—and all worked well. For the new story the old mains and returns were enlarged where necessary, and new extensions put in, with cast iron radiators. With the advent of cold weather it was found impossible to make the apparatus do its work, as the water backed out of the boiler into the returns before sufficient pressure could be obtained to make a circulation. Up to this time there had never been a check valve on the return connection with the boiler, and Mr. Bishop, Superintendent of Buildings and architect for the School Board, was of the opinion that to provide one would overcome the difficulty. The contractor for alterations to the plant and others having extended experience with steam apparatus differed from him, thinking this would have no appreciable effect and that another boiler of the same capacity as the one in use would be found necessary. The check valve was put in at a cost of about \$25, and the system worked as perfectly as ever, satisfactorily warming the whole building even during the extremely cold weather which prevailed at times during the past winter. The amount of fuel con-

The Ornate Low Radiator.

ing it for use under windows. It is claimed that each section exposes 3½ square feet of radiating surface. The radiator is made for both steam and hot water.

sumed is about 15 per cent. more than formerly, with a corresponding increase in the steam pressure required. An additional boiler would have cost nearly \$1000, with an annual cost of at least

\$100 more for fuel than the present arrangement. In the building referred to there are 268,000 cubic feet of space with 2200 square feet of window glass. The heating is entirely by direct radiation and the boiler heating surface is one-tenth the radiating surface, a proportion allowed for ordinary buildings by Baldwin, the eminent authority on steam heating. These facts show a rather wide difference of opinion among people who ought to know the requirements, and that the subject of apparatus for heating or ventilating is one with which architects should be thoroughly familiar.

HEATING NOTES.

THE MODEL HEATING COMPANY, Philadelphia, are issuing a six-page folded price-list of their hot water and steam heaters printed in two colors. One of the pages is devoted to cuts of the apparatus showing the Novelty water circulator, indirect draft, the Standard Novelty, the Dwsrf, the Novelty steam generator, and the Novelty circulator. One page is devoted to an invitation to inspect their line of goods, and to call attention that their ratings have proven correct during the past winter. The entire inside of the folder is devoted to a price-list of their soft and hard coal burners, which are made in 101 distinct styles and ratings.

THE ST. JOSEPH STEAM HEATING COMPANY have filed articles of incorporation at St. Joseph, Mo. The object of the new concern is to furnish steam heat in the city, and the capital stock is fixed at \$50,000, divided into 500 shares of \$100 each, of which W. T. Van Brunt owns 225, Charles E. Roehle, 225, and Ernest P. Wetmore 50.

THE STOCK AND FIXTURES of the Jackson Steam Heating Company were sold at auction to William Rowe, Pawtucket, R. I., who will continue the business.

COL. PAUL HUGHES of the Standard Radiator Company, Buffalo, N. Y., was a visitor among the heating trade of New York City last week.

HENRY S. ADAMS, Washington, D. C., was in New York last week in the interest of the new heating plant for the New York Post Office. He visited some of his friends in this city, and talked over the affairs of the American Society of Heating and Ventilating Engineers, in which he takes a great interest.

WILTSIE F. WOLFE of Boston was a visitor at the New York office of the Fuller & Warren Warming & Ventilating Company, 257 Water street, this week. Mr. Wolfe is well pleased by the satisfaction given by a number of their school house plants during the past winter.

JOHN SWEENEY, 242 Waterstreet, New York, is sending to the trade a circular of the Magee hot water heater, made by the Magee Furnace Company of Boston, Mass. The first illustration is a general view of the heater, and the text calls attention to some of its features. The second illustration shows a side view of the heater with the flow and return connections. A description of the heater then follows, with a sectional view of the apparatus showing its operation.

THE UNITED STATES HEATER COMPANY of Detroit, Mich., are to remove their Chicago office from the present location, 100 Lake street, to 39 Dearborn street, where convenient quarters

have been secured for the display of their steam and hot water heaters.

THE ANNUAL MEETING of the stockholders of the Stover Heater Company, Freeport, Ill., for the election of directors for the ensuing season was held at the company's office last week, and resulted in the re-election of the following directors: D. C. Stover, D. B. Schulte, Charles E. Meyer, A. S. Held, W. A. Merrifield, O. J. Ziegler, W. H. Holland, A. L. Frueh, John Tracy, J. J. Tschudy, Jr., Chas. Nieman. The new board then elected the following officers: President, D. C. Stover; vice-president, Chas. E. Meyer; superintendent, A. S. Held; secretary and treasurer, F. W. Sleske; Executive Committee, A. S. Held, O. J. Ziegler, A. L. Frueh.

HEATING & PLUMBING.

NEW WORK AND CONTRACTS.

HENRY BREYER, 1725 Milwaukee avenue, Chicago, is to do the plumbing and drainage in the residence of G. Roess, 145 Edgewood avenue.

CHARLES UHER, 524 West Eighteenth street, Chicago, has the contract for the plumbing and drainage in the flat building of Frank Hanson, 791 Allport street.

RICHARD T. WARD, 1489 West Harrison street, Chicago, has the contract for the plumbing and drainage in the residence of H. H. Koepee, 1481 West Taylor street.

CHARLES BREYER, 187 West Division street, Chicago, is to do the plumbing and drainage in the residence of J. Koehler, 1229 Humboldt boulevard.

SMITH BROS., 270 Thirty-fifth street, Chicago, are to do the plumbing and drainage in the store building of W. H. Higgins, 153 same street.

JOHN C. GUNDERMAN, 182 North avenue, Chicago, has the contract for the plumbing and drainage in the flat building of Henry Wuestenberg, 65 Mohawk street.

JOHN M. COLLINS, 356 Thirty-seventh street, Chicago, has the contract for the plumbing and drainage in the three residences of W. H. Murphy, Vernon place.

JACOB E. HEADMAN, 656 West Division street, Chicago, has the contract for the plumbing and drainage in the flat building of Julius Fink, 1812 Dearborn street.

JOHN H. SULLIVAN, 328 Division street, Chicago, is to do the plumbing and drainage in the flat building of T. O. Peterson, 135 Sedgwick street.

THIME & ANDERSON, 118 North Centre avenue, Chicago, have the contract for the plumbing and drainage in the four-flat building of E. Stokes, Rockwell and LeMoyné streets.

THE THOROUGHGOOD PLUMBING COMPANY, Rogers Park, are to do the plumbing in the residence of C. Crawford, 763 Jackson avenue.

THE PROPERTY COMMITTEE of the Board of Education of Philadelphia on Tuesday awarded contracts for steam heating fixtures in a number of buildings. The successful bidders for the more important contracts were Thompson Bros., who received the contract for a new boiler in the Mt. Vernon school for \$1275; and Davis & Gorman,

who secured the contract for a heating plant at the Fifth and Porter streets school for \$6088, for heating apparatus at the Adamson school for \$1442, at the Curtin school for \$2063, at the Fairview school for \$1552, at the Forty-sixth street and Woodland avenue school for \$2257, at the Howard and Tioga streets school for \$2033, and at the Diston school for \$1062.

JAMES J. DOYLE, 6040 South Halstead street, Chicago, has the contract for the plumbing and drainage in the two flat buildings of O. E. Engstrand, 6149 and 6151 same street.

ROBERT R. HEANTCH, 5631 Wentworth avenue, Chicago, is to do the plumbing and drainage in the flat building of W. Gardner, 33 Grace street.

THE CHARLES REDIESKE COMPANY, 99 Clybourn avenue, Chicago, are to do the plumbing and drainage in the flat building of Hans Jensen, Belmont avenue and Paulina street.

JAMES J. CONNELLY, 2635 State street, Chicago, has the contract for the plumbing and drainage in the residence of W. J. Stark, 827 Spaulding avenue.

DORE & SON, 1042 West Van Buren street, Chicago, have the contract for the plumbing and drainage in the flat building of Henry Bohne, 1405 Harvard street.

WILLIAM BOWDEN, 238 Twenty-fifth street, Chicago, is to do the plumbing and drainage in the flat building of R. P. Gilson, 5834 Wentworth avenue.

THE KELSEY FURNACE COMPANY, Syracuse, N. Y., have just closed a contract through their local agent in Hartford, Conn., for doing a job of heating in that city with their generator. The contract calls for 12 Kelsey generators of large size, which will be placed in a block of very fine residences now building at the corner of Capitol avenue and Columbia street, Hartford. We understand the contract was only awarded after a careful investigation of the merits of several furnaces, the special feature that recommended the Kelsey being the Positive attachment.

THE Washington State Legislature has passed a bill appropriating \$50,000 for improvements at the State University, such as the erection of a power house, the completion of heating, ventilating and water construction and the erection of a residence for the president.

THE CONTRACT for the plumbing and gas fitting of Charles Myers' new Beach Front Hotel has been awarded to L. E. Freeman, Atlantic City, N. J.

W. H. LATTIN, Bridgeport, Conn., is to erect a new residence which will have a first-class plumbing system.

W. H. MORRISON, Torrington, Conn., has the contract for plumbing and heating in Harlow Pease's new houses, in which he will put a No. 3 Lesder hot water heater; also the plumbing of a cottage for Hotchkiss Bros. & Co. He has just finished the plumbing of the Gilbert School, in Winsted.

THE G. W. HAZEL COMPANY, New Haven, Conn., have the contract for plumbing in the new house of B. A. Tucker.

M. THOMAS, New Haven, Conn., is to erect an \$9000 residence to have a plumbing system and a hot air furnace.

A. H. & C. B. ALLING, Derby, Conn., are to erect a business block that will be heated by steam.

THE TIN SHOP.

The Sheet Metal Class at the Pratt Institute.

It is gratifying to note that the class for instruction in sheet metal pattern work, which was started last fall in connection with the trade school of the Pratt Institute, Brooklyn, and which closed its course on Friday, March 29, has met with complete success. This is the first regular class of the kind undertaken, so far as we know, in any part of the country. It was, therefore, entirely an experiment, and, as such, the undertaking has been watched by us with much interest. That a real want exists among beginners in the roofing and cornice and sheet metal working trades generally for instruction of this kind has long been evident. Numerous inquiries on this head have been received by *The Metal Worker* in the past few years. It was, therefore, with much pleasure that we were able to announce, last summer, that Prof. C. R. Richards, who directs the trade school department at the Pratt Institute, and who is one of the most earnest and progressive advocates

of the applicants was found to be due, not to any misgivings or lack of appreciation on their part, but to the fact that the times were so hard with the workmen in the building trades last fall that many of the would be students found themselves unable to afford the necessary fees. The class was started, however, with six pupils under the tut-

made entirely satisfactory. The whole course covered six months, closing on March 29. This time has been fixed on as the regular term of the class. It is believed that sufficient instruction for all practical purposes can be imparted within that period.

Both Prof. Richards and Mr. Rouillon express themselves as being en-

PATTERN FOR BEVELING ELBOW.

of the trade school movement in this country, had decided to take the initial step in adding an evening class for instruction in sheet metal work to the 1894-1895 programme of the institute.

In point of numbers the composition of the first class was not quite what had been hoped for from the number of inquiries and applications that were received after the first announcements given in these columns. But the withdrawal at the last moment of a number

of the trade school movement in this country, had decided to take the initial step in adding an evening class for instruction in sheet metal work to the 1894-1895 programme of the institute. The curriculum mapped out for the pupils comprised a short course in mechanical drawing, after which followed the study of pattern development on systems embracing the intersection of parallel forms and triangulation, the last two months being devoted entirely to cornice work of all kinds. The intelligent interest in their work displayed by the pupils is reported to have been great and the progress

tirely satisfied with the results achieved. A large accession in numbers is looked for in the second class, which will open next fall. Mr. Richards has recently received a number of inquiries from different parts of the country in regard to the working of the new class, showing that the matter is receiving the attention both of the individuals and of the authorities of other trade training institutions. It is likely that the ball thus set rolling by the Pratt Institute

will grow, and result in the establishment of many similar classes throughout the country in the near future.

Mr. Rouillon, as the result of his recent experience, is now engaged in mapping out a definite system of progressive instruction for the sheet metal pattern classes in future.

Pattern for a Beveling Elbow.

From B. F., *New Orleans*.—When one is to obtain the pattern for a bevel-

C c. From the point of intersection at B draw the miter line B E, thus completing the elevation. For obtaining the pattern the part of elevation indicated by A B E F is all that is required. This part of elevation can be drawn by the method shown in Fig. 2. In this figure let F¹ E¹ D¹ represent the required angle, and make E¹ D¹ E¹ F¹ the same in length. With the dividers set to any convenient distance, and with F¹ as center, strike the arc *f f'*. In a similar manner, with D¹ as center, strike the arc *d d'*. Through the points E¹ H draw G B', extending it indefinitely

In Fig. 3 another method is shown, the miter line B² E² being obtained from the outer angle of elbow. Draw the right angle B² A² F² and let A² B² C² represent the desired angle. Make B² C² equal to B² A². From C² as center strike the arc *c c'*, and with A² as center strike the arc *a a'*. Through the points

Fig. 6.—Method of Obtaining the Pattern.

Fig. 7.—Obtaining the Pattern for Three Piece Elbow.

Fig. 8.—Complete Pattern for Three-Piece Elbow.

PATTERN FOR BEVELING ELBOW.

ing elbow, the first step is to draw the elevation, for which purpose there are a number of methods. To draw the elevation shown in Fig. 1 proceed as follows: Let F E D represent the desired angle, and from F D erect perpendiculars, as shown by F A and D C. From F and D set off the diameter of elbow, and from the points thus obtained erect the perpendiculars A a and

in the direction of B¹, thus securing the miter line. From F¹ erect the perpendicular F¹ A¹, and from F¹ set off the diameter of elbow, and draw A¹ B¹ parallel with F¹ E¹, cutting G B¹ at B¹. If it is desired to complete the elevation, from D¹ erect the perpendicular D¹ C¹, make D¹ C¹ equal to diameter of elbow, and draw C¹ B¹ parallel with D¹ E¹.

on intersection, H², draw the miter line B² E², from which the pattern can be obtained. To complete the elevation, from D² erect the perpendicular D² C², and make D² C² equal to diameter of elbow. From C² draw C² B² parallel with D² E². If it is desired to have the elbow made with more than two pieces, proceed as shown in Fig. 4. Let A³ B³ C³, or F³ E³ D³, represent the desired angle. The miter line B³ E³ is to be secured by any of the previous methods. From E³ draw E³ G³ parallel with F³ A³, extending it indefinitely in the direction of G³. With E³ as center and E³ B³ as radius, describe an arc cutting E³ G³ at G³, as shown. Divide the arc thus obtained into one less number of parts than there are to be pieces in the elbow. In the present instance the arc is divided into two parts, as shown. From the first division draw H³ E³, thus securing the miter line for a three-piece elbow, the elevation of which is shown in Fig. 5. If it was desired to have the elbow made of four pieces, the arc G³ B³ should be divided into three parts and the miter line drawn from the first of these divisions to E³.

In Fig. 6 let A⁵ B⁵ C⁵, or F⁵ E⁵ D⁵, represent the angle of elbow. It will be observed that the pattern is obtained from the miter line B⁵ E⁵, which can be secured by means of any of the methods

previously given. Then to obtain the pattern, proceed as follows: Bisect $A^5 F^5$ in M^5 , and with $A^5 M^5$ as radius and M^5 as center, describe the semicircle $A^5 L^5 F^5$. If desired, the entire profile can be drawn, but the half profile can be used as well. Divide $A^5 L^5 F^5$ into any convenient number of parts, and, with the T-square placed parallel with $A^5 B^5$, carry lines from the points obtained in the semicircle, cutting the miter line $B^5 E^5$. On $A^5 F^5$ extended, as $N^5 O^5$, lay out twice the stretchout of $A^5 L^5 F^5$, as shown by $N^5 O^5$, through the points in which draw the usual measuring lines. Place the T-square parallel with $A^5 F^5$, and, bringing it against the points in the miter line $B^5 E^5$, cut the corresponding measuring lines, as shown. Then a line traced through these points, as shown by $P^5 Q^5 R^5$, will be the pattern. In Fig. 7 is shown a duplicate of $A^5 B^5 E^5 F^5$ of Fig. 4. The pattern, as shown by $O^5 P^5 Q^5 R^5 N^5$, is obtained in the same manner as similar part in Fig. 6. Fig. 8 shows the complete pattern for a three piece elbow having the angle indicated in previous figures. $Q^5 W^5$ represents the throat of elbow and $S^5 U^5 V^5 T^5$ is a duplicate of $O^5 P^5 R^5 N^5$.

Trade Schools.

Prof. Charles R. Richards, Director of the Department of Science and Technology in the Pratt Institute, Brooklyn, recently delivered an address before the Monday Evening Club, at Boston, on the subject of "Trade Schools, Their Place, Education, and Industry," which was calculated to rally public sentiment to the support of the movement now on foot for the establishment of a Franklin Trade School in that city. We are glad of the opportunity of printing the following extracts from Mr. Richards' able and interesting plea for this form of trade training for American boys:

"The trade school movement in this country is of very recent origin. It began with the foundation of the New York Trade School in 1881. Trade classes at the Pratt Institute were begun in 1887, and the trade schools of the Philadelphia Master Builders' Exchange were organized in 1890. The work of these institutions represents practically everything that has been done up to the present time in this country in systematic trade school training, outside of the work performed in colored and Indian schools and in reformatories.

"Before discussing the work of these schools in detail, it may be well to consider the causes which led to the creation of this new institution and what has been accomplished in its development in the older countries of Europe. Previous to the present century the apprenticeship system was the universally recognized method through which a trade training might be obtained. Under this system, the youth seeking a trade was bound to a master workman for a term of years by a legal instrument called an indenture. By the terms of this instrument the master agreed to receive the apprentice into his household and watch over his moral welfare, as well as to instruct him in all the details of his craft. The youth, on his side, pledged himself to serve the master faithfully during the period of his apprenticeship. This system formed an integral part of the privileges and

practices of the guilds and corporations which arose in Europe during the Middle Ages. At that time the system had a political as well as an industrial significance. To acquire citizenship in a free town it was generally necessary to be a member of one of the recognized guilds, and the entrance into apprenticeship was in consequence in the nature of a first step toward the privileges of free citizenship. The length of the apprenticeship term varied in different countries. In England it was seven years; in France, three or four years, and in Germany, two to four years. The practice as to apprenticeship was codified in England during the reign of Elizabeth and put in the form of a statute. According to this statute no one could lawfully exercise, either as a master or a journeyman, any art or manual occupation except he had been brought up therein seven years at least as an apprentice. Every householder dwelling in a city or free town was empowered to take apprentices, but only those might be taken whose parents possessed a certain fortune.

"While all production remained in the hands of master workmen and his corps of journeymen, this arrangement proved natural and efficient. The number of master workmen was large, and the number of journeymen under a single master was comparatively small, and as the master worked in the shop among the men his relations with his apprentices were direct and intimate. It was, moreover, strongly for the master's interest to instruct and guide the apprentices to a thorough knowledge of their trade that they might return to him as great a profit as possible. But with the invention of the steam engine and the introduction of machinery came a great change in industrial methods. The economic advantage of quantity production and the division of labor appeared, and the master, no longer simply the master craftsman, became the directive head of an industrial establishment. From the master workman he has gradually developed into the manufacturer and the contractor—the household workshop into the factory. No longer working with his own hands, he uses his brain to direct more effectively the hands of many. Under these conditions the old relations between the apprentice and his master have ceased. The former direct association in actual work has disappeared and in the new conditions no provision has been made for systematic instruction of the apprentice. In the modern shop, the time of the workman must be accounted for in actual work. No time is left for the instruction of learners. The foreman, on the other hand, being solely interested in obtaining as much product as possible from his resources regards the apprentice as a burden and a nuisance. The natural result follows, that the few boys who are admitted to the trades are either called upon to perform petty drudgery about the shops or are put at such tasks as can be most readily mastered, and kept upon these for long periods, to the neglect of comprehensive training. Under these conditions the apprentice is left to pick up the practice of his trade by observation and such opportunities as chance and the good nature of his fellow workmen afford. The opportunities for a thorough all round training are extremely rare, and the common result is one-sided and superficial. From the position of a necessary and valuable assistant the apprentice has come to be regarded as a nuisance that few employers care to burden themselves with.

"In our own country, this condition of things has reached a peculiarly aggravated phase. Not only has the development of machinery and the carrying out of industrial operations on a large scale taken place with us to an exceptional degree, but another influence has, for many years, been operating to stamp out what is left of the apprenticeship system. This influence is the attitude of the American labor unions, whose rules to-day amount practically to a prohibition of young men entering the trades. Building upon the sophistry that the highest return to the individual is gained by limiting the number of workers in the trades, and that the highest rate of wages per day is the sole criterion of prosperity, the labor unions have enforced more and more stringent rules against the number of apprentices allowed to each employer, until the proportion has reached an amount absurdly inadequate to supply the labor market.

"Eight years ago, the Journeymen Plumbers' Union of New York City demanded that only one helper be allowed to every four journeymen, instead of one helper to each journeyman, as was the custom. This demand was resisted by the master plumbers, and a strike resulted which continued for six months, occasioning an enormous loss to the men and to the plumbing trade, and which ended with the journeymen returning to work without gaining their object. This 'battle for the boys' attracted very considerable attention at the time, and is particularly noteworthy as being the only instance, as far as is known, in which employers have stood out against the imposition of labor regulations restricting apprentices.

"By the rules of the Bricklayers' Union of Brooklyn, each employer is limited to two apprentices. This rule is strictly enforced, with the exception that a bricklayer's son is allowed to enter a shop which already has two apprentices, in case there is extra work, and is permitted to travel from one employer to another in this way. Each apprentice is required to serve four years. By the common statement of a number of Brooklyn master masons very few employers have apprentices at all, and it was the general estimate of these masters that the total number of apprentices in the whole city at the present time is less than 20, and that the number of bricklayers' sons traveling about in the above mentioned way is about 30. But allowing that every opportunity for apprenticeship was taken advantage of, the situation would still be most serious. The total number of masons working in Brooklyn in 1880 was 2761—the number of employers was 110; the average death rate of persons between 21 and 55 years of age, as gained from the statistics of life insurance companies, is 10.8 per 1000. The normal operation of these conditions, provided that no journeymen entered or left the city, and that all the opportunities for apprenticeship were taken, would result in an annual decrease of journeymen bricklayers, between 21 and 55 years of age, in the city of Brooklyn, of 53. As a matter of fact, of course, no such decrease takes place; but, on the contrary, a large addition is made each year to the workers in this trade in all our large cities. Where does this large increase come from? It comes, as they used to say in New York, 'through Castle Garden.' It comes from the constant influx of foreign workmen, who are immediately received into the unions, derive the benefits of their organizations and ob-

tain a voice in their affairs. This influx has been going on for so long a time and at such a rate, that to day foreign born workmen form a majority of the labor unions in all of our largest cities.

"In 1880 the total number of men engaged in the trades of blacksmithing, mason work, cabinet making, carpentry, machine building, painting and plumbing, in the city of Brooklyn, was 18,487. Of this, 9456 were foreign born. In New York City the total number was 42,498, and the number of foreign born 24,974. It is confessedly the fact that the large bulk of these immigrants are not of the better class of foreign workmen; but, on the contrary, are the poorest, the dregs of the foreign labor market, who have found it impossible to compete with better trained workmen at home and who have come to this country to better their condition. These men, often miserably trained, are at once admitted to the unions without any test of character or ability, the voucher of an acquaintance being the only form required. Brought up in comparative poverty in Europe, and regarding capital as the natural enemy of labor, these men have introduced old world prejudices and narrowness into American labor organizations, until to-day the unions of all our largest cities are unreservedly committed to the practical exclusion of the apprentice and to the principle of trade monopolies.

"Upon the continent of Europe the necessity of some provision better suited than the apprenticeship system to modern industrial conditions has now long been recognized, and the idea of trade schools has there been a familiar one throughout the present century. In Austria, Germany, Switzerland, Belgium and France particularly a large amount of study and experiment has been given to the problem, and in these countries there exist to-day many hundreds of industrial schools. It is necessary, however, to lay considerable emphasis upon the fact that a large proportion of these schools are not in a strict sense true trade schools, but are technical schools. A trade school, considered solely as an instrument to perform the function of the apprenticeship system, is a school designed to prepare handicraftsmen for practical work at a trade. Such a school may or may not include instruction other than manual, but its primary object is manual dexterity. A technical school, on the other hand, is an institution in which, in addition to practical instruction in the methods of a craft, the scientific principles upon which it is founded are thoroughly explained and their bearing upon the operations of the trade clearly demonstrated. Such schools may prepare superior craftsmen fitted to become foremen or superintendents, or they may train designers."

After describing in detail the trade school systems followed in various European countries, Professor Richards drew the following inferences therefrom:

"In any attempt to train men as artisans in a school shop, the greatest difficulty must always be the economic one. In the French schools, as indeed in most of the other European schools, this problem is surmounted by dealing with the pupil before he has reached a commercially valuable age. The pupil is entered at the school at 12 or 13, and leaves it at 15 or 16 years of age. The operation of this plan is attended by the objection that at graduation the pupil is too young to have completely

mastered his trade, and must still serve some years of apprenticeship. Another and greater objection, from an American standpoint, is the fact that it necessitates the selection of a vocation at a time when the pupil is quite too young to make an intelligent choice himself, and when, in consequence, the choice of his life work is either determined by his parents or by boyish inclination. Such a system could only be acceptable in the fixed conditions of society similar to those of continental Europe, where the sons of the artisan class are, as a matter of course, expected to follow the trade of their fathers. In this country, with its opportunities for individual development and belief in individual freedom of choice, such a system would find but little sympathy."

Mr. Richards then traced the history of the New York Trade Schools from their inception and foundation in 1881 by the father of the American trade school movement—the late Col. Richard T. Auchmuty—to their present position of power and usefulness, showing how in their case, and of that of institutions subsequently established on similar lines, the problem has been practically solved. He pointed out that it was not their design to turn out the finished mechanic, but to equip the learner with a fair amount of skill in the varied operations of the trade, together with a thorough grasp of the principles involved, sufficient to fit him at once to become the money earning factor. The economic problem of not encroaching too seriously upon the money earning period of life with the school training was met, he showed, by Col. Auchmuty; first, by means of the evening classes which allowed the students to be engaged in a livelihood occupation during the day; and, second, by reducing the length of day classes to the minimum in which it was felt an efficient preparation for active work could be gained—namely, to three months.

"The trade schools of the Pratt Institute and of the Philadelphia Master Plumbers' Exchange were founded upon the New York schools as a type. At the Pratt Institute a policy obtains in regard to the length of day courses somewhat different from that pursued at the New York schools. In Brooklyn the length of day courses is made nine months, with the idea of giving more extended instruction in the trade school itself, at the cost perhaps of reaching fewer students. The belief is also held that the legitimate function of the evening classes is rather to extend and broaden the training of those entered in the trades than to train beginners. In all of these American institutions the principle obtains of confining the instruction given in the schools to an essentially practical preparation for the trade and to pupils of sufficient age (17 to 25) to learn rapidly, leaving the general education to be gained in the common schools previous to entering.

"This system of trade school training received the indorsement of the National Association of Master Builders in their convention at Cincinnati in 1888. At this meeting resolutions were passed that a lad who wished to enter the building trades should go first to a trade school to learn the science and practice of his trade. When the trade

school course is finished, and he has proved by an examination held by a committee of master mechanics, that he has profited by it, he is to enter a workshop as a 'junior.' When old enough and able to do a full day's work, he is to apply for a second examination, which, if passed, entitles him to be considered a journeyman. This system seems well suited in its essentials to the needs and genius of the pupil of the United States, and destined to develop throughout the country. The only serious obstacle to its progress is the attitude of the labor unions, who oppose the entrance of the trade school graduate into the trade, upon the same ground that they seek to limit the number of apprentices.

"The short-sighted and inconsistent policy which thus seeks to close to young men all entrance to the trades, and at the same time allows, without protest, the great influx of foreign workmen, needs little comment. It is intrinsically selfish and unnatural, and being such, cannot long continue. The trade school has come to stay. It has come in answer to a great need, and must develop in answer to that need. The right of American youths to enter the trades and to equip themselves in the most economical manner for a livelihood, cannot much longer be gainsaid or set aside. What might under other conditions become the tyranny of a class, cannot long exist beside the free institutions of our country. On the contrary, the true interests of organized labor are to be found, not in futile opposition but in active participation. The opportunity is at hand for the labor organizations of the country to actively influence, and, to a certain extent, direct the trade school movement. By co-operation with the schools, they can do much to realize the highest opportunity for usefulness that is open to them. By selfish and bigoted opposition, they will do much to cripple and narrow their own power. A comprehensive system of trade training suited to the times would involve the recognition of the trade school graduate by the trade organizations of the journeymen, as well as of the masters, and his establishment with a definite place and a definite economic value in the industrial world. Such a system, while effectively preventing the admission of imperfectly trained workmen, would afford ample opportunity to every naturally qualified candidate. An arrangement of this kind would open the doors of the trades to American youth, without requiring the sacrifice of all opportunity for culture that is now demanded. Such an arrangement would mean, to a large extent, the Americanizing of the trades—it would mean the addition to our industrial army of young men who have had the opportunity of a good public school education, and who are fitted to assume the duties of citizenship with intelligence and patriotism, as well as to attain to the highest efficiency in the operation of labor."

President Ingalls of the "Big Four" and Chesapeake & Ohio Railroads, in a recent interview reported in a New York journal, expressed himself as being entirely satisfied with the outlook for his roads. He stated that the business for March has been exceedingly good, and will show a large increase over last year in both gross and net receipts in both systems. Mr. Ingalls mentions that business is particularly good in the small manufacturing towns along the lines of the "Big Four."

ROOFING AND CORNICE.

The Chautauqua Eave Trough Hanger.

The accompanying illustration shows the Chautauqua eave trough hanger made by the Chautauqua Mfg. Company, Mayville, Chautauqua County, N. Y. The particular feature to which the manufacturers allude is that it can be attached to or removed from the trough very quickly. No tools are required, nor are solder, bolts or nuts used in its construction or fastening. In repair work it is said to be particularly convenient and a first class job can be executed without taking the trough down. The hanger presents a neat appearance, and being fastened to the back of the trough, it does not jimmie the bead and is furthermore so constructed that it will in no way check the flow of water. In

The Chautauqua Eave Trough Hanger.

applying this hanger to the trough the hook is caught from the back of the trough and the hanger brought around over the bead, the locking bar being then swung over the top of the trough and under the hook. The hangers are made in all sizes, with $\frac{1}{2}$ -inch and $\frac{3}{4}$ -inch beads.

FLASHINGS.

THE ILLINOIS ROOFING AND SUPPLY COMPANY, 203 Lake street, Chicago, have brought out a handsome 100 page catalogue of their specialties. They are manufacturers and jobbers of steel roofing, corrugated iron, steel brick siding, rock face stone, patent ceilings, metallic shingles, shutters, eave troughs, hangers, conductor pipes, cornices, window caps, finials, &c. The catalogue thoroughly covers the business of roofers' supplies, copious illustrations being given of methods of applying metal roofs and sheet metal work generally. Rules for measurement are printed, as well as complete price-lists.

FRIEDRICH & KELLEY, Holyoke, Mass., have removed their offices from 510 Main street to 480 Main street, and are now using the entire building at the

former address for the manufacture of corrugated conductors and gutters, which are their leading specialties. These are made in 10 foot lengths of extra heavy stock with only one seam, and are put on the market at a low price.

A BLOCK of three stores for E. O. Martin is to be erected at Waterbury, Conn. The building will have galvanized iron cornice, skylights and tin roof.

LANDELL & SKELTON have gone into business at Fayetteville, Ark. They will deal in roofing, guttering, cornice work, &c.

J. M. & L. A. OSBORN, importers and jobbers of tin plate, tinware and tinner's supplies, Cleveland, Ohio, are distributing to the trade a large sized yellow card bearing a gold star in the center and advertising the "Osborn Old Style" guaranteed roofing plates, made specially for this firm. Messrs. Osborn express the belief that they carry the largest assortment of well known brands of roofing plates of any house in the United States.

J. C. McFARLAND, 2511 to 2519 State street, Chicago, has the contract for about 650 squares of slate roofing to be laid on iron purlins and 5 tons of copper work for the tin can factory of Norton Bros., Baltimore, Md.

The Williamson Trade School, Media, Pa.

The second commencement of the Williamson Free School of Mechanical Trades, Media, Pa., took place on Saturday, March 29, when 32 young men, after completing a three years' course of manual training as machinists, bricklayers, carpenters and pattern makers, were given their diplomas. The occasion was made one of special interest by the presence of a number of distinguished persons. The boys, of whom 168 are now receiving instruction in the school, were addressed, among others, by Governor Hastings of Pennsylvania, Ex-Postmaster-General Wanamaker, who is president of the Board of Trustees of the school, Job H. Jackson, president of the Jackson & Sharp Company, Wilmington, Del., and representatives of the Philadelphia Master Plumbers' Exchange, as well as members of one or two trade unions. The Williamson School is now firmly established on the lines laid out by its founder, the late Isaiah B. Williamson, and it has turned out a number of well-trained and efficient mechanics. Its condition is reported to be in every respect satisfactory. The trustees have established the school on a broad and liberal basis; and the boys, who all live at the institution, are there sur-

rounded by the best influences, and in every way fitted to start on a useful industrial career under the best auspices.

Trade Notes.

THE decoration on the back of the advertising letters sent out by the Joseph Dixon Crucible Company, Jersey City, N. J., this month shows a bird's-eye view of a line of umbrellas, typical of the showery month of April, the calendar for which is at one side.

THE FRANKLIN MFG. COMPANY have been chartered at Austin, Texas, with a capital of \$50,000 to manufacture pumps, &c.

THE KEENE LANTERN COMPANY were formed at Waterville, Maine, last week, with a capital stock of \$46,000. W. L. Keene being president and W. F. Brown treasurer.

AN ADDITION is to be built to the enameling department of the Eastern Tinware shops, at Portland, Conn. The new building will be 40 x 70 feet.

ON APRIL 2, Judge Dallas, in the United States Supreme Court, Philadelphia, appointed the Girard Life Insurance, Annuity & Trust Company of Philadelphia a receiver to take charge of the property in the State of Pennsylvania of the McCullough Iron Company of Delaware. There are said to be about \$45,000 worth of assets of the company in the State of Pennsylvania. The Girard Trust Company, in connection with Henry Whitley, are already receivers for the property of the McCullough Iron Company in Delaware and Maryland.

THE CONSHOHOCKEN GALVANIZING COMPANY of Conshohocken, Pa., were incorporated at Harrisburg, Pa., this week, with a capital of \$30,000. The incorporators are James E. Salter, Philadelphia, Jawood Lukens, Jesse L. Heywood, A. L. Murphy, Henry M. Tracy and Lewis N. Lukens.

J. M. & L. A. OSBORN, Cleveland, Ohio, publish a sheet iron list that they will be glad to send to the trade on application. The list relates to their Juniata galvanized iron and cold rolled steel; also black sheet iron and soft steel sheets. On the back of the circular is a serviceable table giving the weights of sheet iron per square foot, both black and galvanized; the number of sheets generally placed in bundles of galvanized iron and the square feet per sheet. The trade will find it a convenient reference card.

WILLIAM HIGHTON & SONS of 55 Charlestown street, Boston, Mass., and 40 Otterston street, Nashua, N. H., have issued a catalogue and price list relating to the lines of hot air registers, ventilators, &c., which they are prepared to supply at short notice. The pamphlet consists of 28 pages, neatly printed on good paper and bound in colored paper covers. In offering this price list to the trade the firm request that all old lists be destroyed, as the present edi-

tion contains changes in prices and many additional sizes and designs, to which attention is invited. A feature of the publication is found in several colored pages which are introduced to as to show to better advantage the designs finished in gold bronze, electro bronze, copper bronze, silver bronze, electro copper plate and nickel plate. The assortment of goods to which reference is made covers a wide range and the catalogue will doubtless prove of interest to many in the trade.

IT IS REPORTED that the Star Iron Works of Lindsay & McCutcheon, Allegheny, Pa., where Muck Bar has been the exclusive product for some years, will be turned into a plant for the manufacture of Iron and Steel Sheets.

THE CHICAGO STAMPING COMPANY, Chicago, report that the sales of their Seamless Neck Milk Can stock have been far beyond their expectation.

THE TROY SHEET METAL COMPANY of Troy, N. Y., have been incorporated, with a capital of \$15,000, to manufacture, purchase, sell and repair articles made of sheet metal. Directors: Jessie D. Ennis and Robt. J. Wylie of Troy and F. H. Knox of Lansingburg.

THE NUBIAN IRON ENAMEL COMPANY, Cragin, Ill., will shortly be succeeded by a new corporation styled the Nubian Iron Enamel & Varnish Company, with a capital stock of \$50,000. They will continue the manufacture of Bonnell's Blacks, which have established for themselves an enviable reputation.

The new Galvanized Iron and Steel Association in England have formed an alliance with the black sheet manufacturers of that country, under the terms of which the members agree to trade only with each other, no outsiders being admitted to the receipt of orders for black sheets from the galvanizers, while, on the other hand, the sheet iron manufacturers engage to supply only such galvanizers as are in the alliance, with raw material. By a code of iron bound rules the alliance is to be a close corporation, the object, as stated, being the benefit of both branches of the trade. One significant proviso in the arrangement is that those galvanizers who roll their own sheets are to be prevented, so long as the alliance holds good, from further extending their rolling mill plants.

The agitation for better sanitary conditions in bake shops which has been going on in several large cities of this country is being shared on the other side of the water. The Operative Bakers of England have taken the matter up and have presented the evil to the local authorities in various parts to such good effect that in the case of the British metropolis the London County Council are about to introduce a system of licensing the bake houses, which is directed to the extinction of the basement bakeries which have been proved in both countries to be a prolific source of disease and contagion, as well as being dangerous to those working in them.

Some of the leading manufacturers of the State of Georgia are endeavoring to form an organization, to be known as the Georgia Manufacturers' Association, with the object of forwarding the industrial interests of that section.

Latest advices from Cuba indicate that the insurrection is spreading and that the insurgents are gaining force.

New York Trade School.

Fourteenth Annual Commencement.

The annual commencement exercises of the New York Trade School were held in the school auditorium at Sixty-seventh street and First avenue on Thursday evening, April 4. The hall was handsomely decorated and an enthusiastic audience numbering about 300 were present, among whom were a great many ladies. There were also present nearly 300 pupils. Notable among the audience were ex-Mayor Abram S. Hewitt, President R. Fulton Cutting, Chas. J. Gillis, James Curran, E. D. Smith, S. J. Geoghegan, J. L. Wells, E. Murphy, W. J. McDermott, Col. Geo. D. Scott, John Yule, S. E. Dibble, Thomas McNeill, T. J. Tuomey, James Muir, Frank Reynolds and J. Pierpont Morgan, Jr., A. K. Mackay and representatives of the various trades taught at the school.

The Yell of '95.

The audience, after inspecting the work of the young mechanics, had hardly become seated when they were greeted with the yell of the Class of '95.

Sizzle! Sizzle! Razzle! Dazzle!
Sis! Boom! Rah! New York Trade School.
Rah! Rah! Rah!

The boys all wore the Trade School colors, a strip of royal purple ribbon, and many wore the badge adopted by the trustees, which is a 1/4 inch silver circle, with a dark background with the letters N. Y. T. S. and the date 1895 around the edge, with the right arm of a mechanic holding a hammer in the center. Immediately after the yell President Cutting greeted the guests and said that the exercises would begin at once, and he introduced Lewis Hopner, president of the New York Association of Master Painters and Decorators.

Address of Lewis Hopner.

The short address by Mr. Hopner was attentively listened to and was in part as follows: "We meet to night for mutual benefit and pleasure, and to give you, young men, an incentive to perfect yourselves in your trades, that you may be entitled to a reasonable compensation for your work. Have patience, perseverance and prudence and earn that success which commends itself to your own conscience. I caution you against the know all mechanic. Beware of them, they have a great faculty for ignorance. No man knows it all and you have a vast deal to learn. I would say in closing that, as the painter labors where there are ladies and children, and when their protector is away, always be gentlemen."

Mr. Cutting then introduced Edward Murphy, saying: "I now have the pleasure of introducing one of the best friends the school ever had."

Address of Edward Murphy.

Among other things Mr. Murphy said: "Something over 14 years ago I was taken into the confidence of Colonel Auchmuty, whose deep interest in the welfare of young men is manifested in the establishment of this institution, where you men are helped to an honorable independence by being taught the means of earning a livelihood. This school opened 14 years ago with but 30 pupils, but since that time 5250 have passed its portals possessed of a certificate showing that they had mastered the principles of a trade and were ready to increase their value by practice. The

value of a trade was considered by Colonel Auchmuty as equal to the income from \$30,000 invested in Government bonds, and it only requires simple multiplication to show that the graduates of this institution represent a capital of millions of dollars."

Mr. Murphy then congratulated the plumbing class on the skill shown by their work and wished all success in their lives.

President Cutting next announced that the certificates would be presented. John H. McCullagh presented certificates to 31 carpenters and John Noll presented certificates to 40 painters and decorators.

The Allison Medal.

A medal furnished by W. H. Allison is presented every year to the pupil who has shown the greatest proficiency in the painting class, and this year it was awarded to John L. Looock, St. Thomas, Canada. Certificates were presented to 18 young bricklayers by Erskine Van Houten. President Cutting, in behalf of this class, presented to their instructor, Thomas Carey, a handsome pipe, which he received with a neat speech, inspiring the young men to never be discouraged and become idle, but as soon as one job was finished to keep working in hunting for another.

James Hughes presented certificates to 24 blacksmiths, T. J. Tuomey presented certificates to 43 plumbers from the evening class, and James Muir to 93 plumbers from the day class. President Cutting, in behalf of the day plumbing class, presented all umbrellas to Superintendent John Delehanty and instructors John McMenamy, Rutherford Clark, Thomas Kelly, J. J. Lynch and T. B. Walsley, and Mr. Delehanty thanked the class in behalf of the instructors, stating that he regretted to be separated from the boys who had become dear to him and that they might still consider him their preceptor when they met perplexing problems. Chas. J. Gillis then presented certificates to 6 printers and 13 steam fitters. When the presentation of certificates was ended President Cutting introduced the Hon. Abram S. Hewitt, ex Mayor of New York.

Address of Abram S. Hewitt.

The following is a brief summary of Mr. Hewitt's remarks: "I owe the pleasure of being here to night on this interesting, instructive and hilarious occasion to an accident that occurred to prevent me attending a year ago. When I heard the call of the roll of those who had received diplomas, and the place of residence assigned to each, I might well have imagined that I was listening to a roll call in the House of Representatives. The illusion might have been perfect had those who come up for their diplomas not borne evidence of a higher order of intelligence. Mr. Cutting no doubt invited me to speak thinking that I had a large experience to draw from, so I take the liberty to be reminiscent, for one of the privileges of old age is garrulity, as my friend Mr. Muir can testify, though I do not wish to be understood to imply that Mr. Muir is garrulous. I am delighted to be once more in the circle of millionaires, Muir, Cutting and Tuomey, and have noticed that all of the umbrellas presented have hooked handles, which I presume is for raking things in."

Mr. Hewitt spoke of the early apprenticeship system and of the control over workman tyrannically held by the guilds previous to the French Revolu-

lution, when their power perished. This was a revelation, liberating the workman, and the result soon seen was the steam engine and the progress that has made our modern world. It was said in his early days that a young man had gained his freedom when he had finished his apprenticeship, but how much more was this true of his hearers who enjoyed the liberty to exercise their right to labor wherever it was offered. It has brought about a co-operation so broad that its glory crowns the nineteenth century.

"If you ask whether it is the right of the workmen to associate together for the general welfare, and to increase the rate of labor, then I say yes. It is not only their right, but their duty. But it is when the trades union steps beyond the pale of the law, and assumes the right to compel or prevent labor, that it violates the fundamental principle of human liberty and Christianity. So also has the employer the right to combine with others, but when he oversteps the law, then he has violated the principles upon which the Constitution rests. But I see the dawn of harmony between the employer and the employee. When that time comes questions will be discussed and considered by honest men. The workman will not be deprived of his individual liberty. These late disturbances are among the last, and the time is at hand when there will be absolute equality to every man who breathes beneath the flag of the Union."

Address of R. Fulton Cutting.

The following is a brief report of Mr. Cutting's address: "You have been here a season and are going out tradesmen. You have gained a great deal and we want to gain something. We want to hear from your employers that you are not only workmen but men of honesty and integrity, not tradesmen but trades men. We want to hear that you give an honest day's labor for your wages. Don't join a trades union just to get work and wages. If you do join, join to elevate it, to make it the aristocracy of trade workers in intelligence, ability and integrity. Don't be satisfied with mediocrity and one wage for all, strive for the aristocracy of dignified labor. Now I wish you all success. You know how to work and how to live. I bid you all good night."

Graduates in Day Plumbing Class, 1895.

William Bailly, New York City.
William H. Bailey, Jr., Troy, N. Y.
Howard Baxter, Gloversville, N. Y.
Samuel Berla, Newark, N. J.

Geo. H. Brown, Chicago, Ill.

SCOTT'S EXTRA COATED brand of roofing plate is the subject of a neatly printed circular in red and blue received from Follansbee Bros. Company, successors to James B. Scott & Co., Pittsburgh, Pa. Attention is called thereby to the special merits claimed for this well-known plate, which, it is said, carries the largest proportion of pure block tin possible, and is made by the palm oil process without the aid of acid flux. As a test of the validity of this claim, it is stated that only rosin need be used when soldering the plate.

SAYS the *Iron and Steel Trades Journal* of London: "The tin plate works, including black plate mills, either erected or in course of erection in the United States, are already more than sufficient to supply the whole of the American market, and there is danger of overproduction. Still the shipments from Swazee and L. verpool to American ports show signs of improvement; and, looking at our export returns, we wonder what becomes of all the plates made in America."

(Continued from page 38.)

part of the purchasers in the existing condition of the tin plate industry of South Wales.

THE New York office and warehouse of Merchant & Co., Incorporated, which is under the management of C. H. Bolks, Jr., was transferred this week from its old location at 247 Pearl street to 245-247 Water street, where a five-story building has been leased, affording considerably more commodious quarters, and enabling the firm to carry larger stocks of goods to meet the requirements of their customers.

THE WHITAKER IRON COMPANY, Wheeling, W. Va., have started up four sheet mills, which have been idle for the past few weeks.

A DISPATCH from Cumberland, Md., refers to the likelihood of the Coates of Baltimore, who until recently operated the tin plate mill at Locust Point, starting a similar works at Cumberland.

A NEW TIN PLATE MILL is spoken of at Bellefonte, Pa., as likely to be located in that town under the auspices of ex-Governor Beaver of Pennsylvania.

THE JAMES McDONALD & SONS COMPANY, Cincinnati, O., are working on double turn at their tin plate works in that city. The company have two tinning sets in operation and are producing two grades of roofing plate, with which, they state, they have achieved good success in the market.

THE LEECHBURG FOUNDRY & MACHINE COMPANY, Lechburg, Pa., have shipped a Mesta patent pickling machine, crates, vats and other appliances to the Crescent Sheet & Tin Plate Company, Cleveland, Ohio.

THE PONTYMISTER TIN PLATE WORKS, Newport, Monmouthshire, one of the largest in the British tin plate trade, were closed down last week.

THE STRUTHERS IRON & STEEL COMPANY, Youngstown, Ohio, have been granted a charter of incorporation, with a capital stock of \$50,000. The new concern are composed largely of Youngstown capitalists, Jonathan Warner of Niles, Ohio, being general manager. The concern have recently purchased the Summers Iron Works, formerly operated by Summers Brothers & Co., at Struthers, Ohio, and propose to engage in the manufacture of iron bars, sheet bars and iron and steel sheets.

WORK has been begun on the additions to be built to the New Castle Steel & Tin Plate Mill.

A BROOKLYN JOURNAL makes the remarkable statement that there are now no less than 166 tin plate works built, or building, in this country. The difference between tin mills and tin plate works is evidently not clear to the average journalistic comprehension. If 166 tin plate works were actually in existence in the United States manufacturers might well cry out at the danger of overproduction.

THE offices of the Duquesne Tin Plate Works, have been removed from Lewis Block to rooms 909-910 Carnegie Building, Pittsburgh, Pa.

A TEST was made on Wednesday of the machinery at the recently erected tin plate plant of the Pennsylvania Tin Plate Company, New Kensington, Pa. Everything is reported to have worked admirably. The company expect to be producing plates next month.

STOVE TRADE NOTES.

The Furnace Trade.

The sudden rise to popularity of steam and hot water heating and the extent to which these systems have been introduced during the past few years have, in the minds of some, clouded the fact that hot air furnaces are still manufactured. Judging from the conversation of some heating engineers one would suppose that hot air furnaces were things of the dark ages, and that the only business done in them now was in the way of repairs and in very insignificant work. We do not mean to say that this impression is at all general or obtains among those who keep themselves familiar with the heating trade, but every one is aware that there are some enthusiasts who, in their advocacy of steam and hot water, have quite lost sight of the fact that the business in hot air furnaces is enormous in extent and constantly growing. With a view to gathering some particulars about this important industry, we have inquired of manufacturers to ascertain their opinions upon the present growth, its tendencies, the trade as compared with the recent past and what the future of the business is likely to be. What follows is a summary, partly in the form of quoted extracts from replies of our correspondents and partly made up from the opinions dispersed through their different letters. It will, we believe, reflect, with a fair degree of accuracy, the prevailing opinion of the trade, for the correspondents from whom we quote are important representatives and are scattered over all the country; that is, over so much of it as contains foundries where hot air furnaces are made.

Furnace Material.

Every one who follows the furnace trade or familiarizes himself with the changing product in this department is aware of the partial substitution of wrought metal—that is, wrought iron, or, in the present day, steel in place of cast iron. The two metals—wrought iron and cast iron—are used in all sorts of combinations, and we have furnaces made of all cast iron or all wrought iron and of the two combined in varying proportions. There seems to be a tendency to employ the wrought metal, but we have been greatly surprised at the unanimity of opinion respecting the future of the cast iron furnace. Never mind how much the particular manufacturer favored wrought metal, hardly a single one expressed the belief that wrought iron or steel was ultimately to prevail in this department of manufacture. They recognized its usefulness,

pointed out its merits and also its defects, but at the same time they believed that cast iron has certain qualities that will always insure its partial use.

Competition of Steam and Hot Water.

We think a couple of years ago rather more than at present there was a firm belief in the further rise and final ascendancy of steam and hot water heating for both public and private buildings. As these newer systems, however, are being closely studied and compared on their merits with hot air furnace heating, it is recognized that steam and water have their appropriate fields, and leaving out the prejudices of individual house owners, who will prefer one or the other system irrespective of the merits particularly adapting it to the building in question, the tendency seems to be to establish such apparatus as will give the most beneficial results for the least outlay. Whatever competition exists between these systems and hot air is probably most emphasized in the case of hot water boilers. The steam heating systems have found most favor in the larger buildings, and the relative popularity of hot water heaters has been in dwelling houses where they would come more directly in competition with furnaces; or perhaps it would make it clearer to explain that steam for large work is not a thing of yesterday, but has been used for years, while hot water is a more recent system of heating. One of our correspondents in speaking of this matter says:

We do not think that steam boilers affect the sales of furnaces in our part of the country to any extent. There are some special localities where they do. Hot water boilers, however, come in competition to a greater extent, but relatively there has been an increase in the sales of furnaces during the last two years.

Another prominent manufacturer is even more definite in his statement and says: "Hot water affects the furnace trade in new dwellings of the \$1500 class and up, and the same applies to steam."

Another Eastern manufacturer writes: "Steam and hot water boilers are used only in large dwellings and public institutions and affect the sale of very large sizes of hot air furnaces. The effect, however, is not noticeable in the sale of furnaces smaller than 40 inches."

We have one rather emphatic communication on the subject that illustrates the extreme views of the hot air furnace advocates. Our correspondent writes:

Steam and hot water heating is a fad at present for low cost contracts, and

cuts into the sales of hot air furnaces; but better results, better quality of air and also less cost of management can be obtained with hot air for large dwellings. They are also more economical in small public buildings which are only open part of the week. Another point to bear in mind is the cost of repairing damages to plant and buildings from faulty management, which will favor hot air heating in the future. We find a growing demand for the better class of furnace work.

Combination Heating.

There have been those in the furnace trade, and we believe there still are some who have the greatest faith in the future of combination heating. They begin by saying that the hot air furnace is the proper style of heater, then admit that it is difficult to carry the air to distant points of a house and force it against the direction of prevailing winds. This is all overcome, they claim, by the use of a coil or other attachment which furnishes steam or hot water. This attachment permits the heating of the most distant rooms or apartments, and in the eyes of its friends is the most perfect heating system. We are somewhat surprised, however, to find that the opinion of many of our correspondents was adverse to the combination system, and fully half the replies that we received showed that the writers did not put much faith in the future of combination heating. Others, however, were great believers in this system, as for instance one large manufacturer who writes:

"There is no doubt of the future of combination heating. It is destined, in our judgment, to be the most acceptable form of heating in the larger and finer class of dwellings."

On the other hand, an equally prominent firm write:

We do not believe in the future of combination heating. The sale of this construction has materially decreased. As a rule they have given poor satisfaction. It is hard to balance the job, there is either too much hot water or steam and too little hot air, or vice versa. This fault in the system causes just complaint and we expect soon to see the end of it.

Another skeptic writes:

The combination system is an attempt to get all the benefits at the lowest cost and is not a success—for the owner—at present. They are of course good for the maker to sell, but are bad in construction, too complicated for the result reached, not durable, and if not much improved, short lived.

Extending Use of Furnaces.

The most gratifying thing about all the answers we have received and which surpasses even our anticipations is the

almost universal testimony that is borne to the increasing use of hot air furnaces in the smaller houses. Not only are they coming into employment in the smaller suburban residences and town dwellings, but what is more significant, they are going into the decidedly rural districts and into the farming country. Apart from the general advance that is taking place in the standard of comfort, and which would explain in large measure the introduction of furnaces in places where a few years ago it would not have been supposed possible to have sold them there has also to be borne in mind the facts that fire wood is not as plentiful a material as it was some years ago and that coal is dispossessing wood, and with the newer fuel comes the newer apparatus for burning it. One correspondent, writing from Illinois, says:

In this section farmers are just beginning to appreciate the furnace heating system. We have put in several jobs for them and find that they have generally a better appreciation of a good thing than people in towns, and yet we doubt if more than one farm in a hundred in Illinois or Iowa can boast of a furnace.

A manufacturer in Ohio writes: "There is a very noticeable increase in the demand for furnaces from farmers and townspeople. We have a furnace especially for this trade and have been surprised at the remarkable demand for it."

A manufacturer located in Pennsylvania writes: "We erected over 60 furnaces last season in the extreme back country, far from railroads, and in places where we would have thought that furnaces were practically unknown."

Of course this increasing use of furnaces is having its effect upon the stove trade, and theoretically one furnace means the displacement of several heating stoves. This is touched upon in a communication from a New York manufacturer, who says: "It is not an exception to sell five or ten furnaces in small towns where several years ago furnaces were unknown. These sales have cut into the stove trade very much in large towns and cities."

Furnace Statistics.

Together with the information referred to, our correspondents have in many cases furnished us statistics of their trade in furnaces during the past five years, and it is quite remarkable to note the similarity of increase and decrease. Beginning with 1890, the smallest year, 1891 showed a considerable increase, 1892 much larger increase, 1893 a decline, and 1894 a further decline, going back to about the same figures as 1891. We have taken all the figures and averaged them, and then reduced them to the basis of 100 for the year 1890. According to this calculation for every 100 furnaces sold in 1890 there were 105

sold in 1891, 120 sold in 1892, 119 sold in 1893, and 106 sold in 1894.

The general stagnation prevailing in business circles last year is a sufficient explanation of the decline in the trade in furnaces. It has also been said, however, that there is an over supply of buildings, and this with a consequent depression in the building trade will prevent an increase in the furnace trade this year. It is doubtful, however, if this opinion will be the prevailing idea of the trade, and it represents rather, we believe, the condition of things in one section.

The New England Stove Trade.

A comparison of the business of the first three months of 1895 with the same period of 1894 shows that the stove trade in New England is on the whole a trifle better. The business of the months of January and February was considerably larger, but the month of March was dull enough to almost offset the gain of the preceding months. Weather conditions have been unfavorable for building operations, and this undoubtedly has retarded the demand for ranges and furnaces. Much building, however, is projected for the early summer; in fact, architects say that this year is likely to be a better building year in this vicinity than any since 1892. Competition does not seem to be sharper than heretofore and prices are fairly well maintained. Reports of collections vary, but the general view of this important feature of the business shows it to be as satisfactory as can be expected under existing circumstances.

Jobbers of refrigerators and oil and vapor stoves have received some good orders, as most of the retail dealers have laid in their first stocks. These are supposed to hardly cover the season's requirements and duplicate orders are expected when trade opens. The demand for the lower grades of heaters seems to be far in excess of that for higher priced lines. The furnace trade is dull, but the outlook is regarded as favorable owing to the good prospects for building, as noted above. Competition in this line is keen, but the standard makes are held quite firmly, in some cases by means of a cheaper article which is put out to act as a sort of protector to the higher priced goods and sold to those who insist upon an extremely low figure.

THE J. H. McLAIN COMPANY of Canton, Ohio, refer to their Oxford perfect blast furnace as possessing a number of features which should commend it to the attention of all thoughtful and wideawake dealers. The claim is made that the furnace "utilizes indirect currents, increasing the heating capacity fully 25 per cent." Every part exposed to the fire is of high grade gray iron casting and there are no sheet metal joints. The heater is so arranged, it is stated, that it can be changed from a soft coal to a hard coal burner in ten

minutes, at a cost of a few cents. The makers refer to the Oxford as "the most efficient, the most economical and the most durable furnace built."

The Phillips Sanitary Grate.

The illustration herewith shows the Phillips sanitary grate, patented by Geo. Phillips and manufactured by the British Columbia Iron Works, Limited, Vancouver, B. C. The device consists of a square steel box arranged in the fire place above the grate proper. In the box are a series of tubes through which the products of combustion are made to pass before escaping to the chamber. By an arrangement of damp-

The Phillips Sanitary Grate.

ers they may be made to travel through a) or a part of the tubes, as desired; or a direct draft may be opened. The chamber in which the tubes are confined is provided with an opening to receive cold air from the outside, and from the top of the chamber openings are arranged by which the heated air may be delivered in the same room, carried to an upper room or to a room adjoining that in which the grate is placed. It is stated that the grate brings as much air into the building as it takes out, providing for an influx of fresh air to replace the air which has become foul and is carried away by the grate. It is claimed that a large saving in fuel is effected by extracting the principal part of the heat from the products of combustion before they make their escape and that the grate will heat several rooms, according to their size. While the device is adapted for use in connection with any open grate, a special grate is manufactured by the company for use in connection

with it which is very attractive in appearance and arranged with adjustable blower. It is claimed that one of these grates has heated a room 24 x 80 with a 12 foot ceiling to 70° in the city where it was manufactured.

Oven Door Handle.

W. W. Shoe, 428 Walnut street, Philadelphia, is putting on the market the handle shown in the accompanying cut for use on oven doors. It is made of two concave strips of steel drawn to sockets at the lower end and fastened at the upper end with a steel cap. The whole is nickel plated and polished, which adds considerably to its appearance. The maker claims that it is cool

Oven Door Handle.

to the touch on the hottest oven door and enables an operator at all times to open an oven door without danger.

Gas Hot Plates.

Buyers of gas hot plates will no doubt note the change in the construction of the goods which are being pushed the strongest this year. There has been a tendency in this, as in many other lines, to make price the all-essential and attracting feature, and little effort has been made toward improvement generally; yet the hot plate has filled a very important place in kitchen service and has been a source of much comfort. The defects that have been discovered are so universal that the sales have not grown in the proportion that had been expected. This year a better class of burner is being presented, and a careful effort is being made to secure the best possible combustion and a high efficiency with a low consumption of gas. It has been noticed that burners of the better grade of construction are less troublesome about lighting back when used with gas of different quality and under different pressure, and it is claimed that some of the stoves now offered give all concerned far less trouble on this account. It was premised by the manufacturers that the gas hot plate would be used on top of the kitchen stove, where a considerable heat reflected down would be no disadvantage;

in practice, however, this is not generally so. The advantage of good light on the cooking and the comfort of air to the cook have brought the hot plate into use on a table near the window, and the intense heat which is reflected down has been found a serious annoyance. Many of the new hot plates are provided with what might be termed long legs, which raises the burners high enough for a good circulation of air underneath them.

ODD PLATES.

THE WOLFF GAS RADIATOR MFG. COMPANY, 164 Franklin street, New York, are bringing out a new gas hot plate with two and three burners. The top is made perforated, so that the heat of the flames may pass up and around the cooking utensils, and is perfectly flat, so that the vessels may be moved from one part of the stove to another without obstruction. The burners are provided with an adjustable air mixer.

THE WALKER & PRATT MFG. COMPANY, Boston, Mass., have changed the name of their entire line of ranges to Crawford, and added to their assortment a new range called the Gem Crawford. They now offer the Crawford ranges in the Grand, Columbian, Art, Gem and 1885 styles.

THE RIDGWAY FURNACE COMPANY, manufacturers of the Ridgway revolving open fire pot furnaces, have removed from 76 North street to 6 Portland street, Boston, Mass., where they occupy about 5000 feet of floor space in a building recently erected. This change affords them ample and convenient offices, a light showroom and storage capacity for carrying furnaces for immediate shipment. In connection with this they have a complete tin shop. Their foundry is located at Foxboro, Mass., where preparations are being made to produce a larger output than ever before, and the general policy of the company will be to extend their field with the trade at large. This concern have recently been reorganized, with Charles L. Ridgway, president; Edward T. Saxe, treasurer, and Charles J. Ridgway, secretary. Mr. Saxe, who recently became connected with the company, has had large experience in manufacturing, as an executive officer in another corporation in the metal line.

THE MARCH - BROWNACK STOVE COMPANY, Pottstown, Pa., are calling attention to the new open fire place grate recently introduced by them. It is known as the Art Franklin and is designed for service in halls, dwellings, libraries, dining, sitting and other rooms, and embodies an arrangement for heating overhead rooms. A feature in the construction of the grate is the arrangement of the blower, which allows of the fire being raked with the blower in position, thus making the grate both gas and dust tight. The draft is said to be under perfect control and the grate may be closed with the blower at night, insuring protection from fire and keeping the fire until morning. The shaker is used to remove the blower, the danger of burned fingers thus being obviated. The grate bars are of the oscillating type, therefore a poker is not necessary. The grate is adapted to the burning of hard and soft coal, wood or natural gas. The grate being a ventilator as well as a heater should meet with a good reception at the hands of dealers.

THE RICHARDSON & BOYNTON COMPANY, 234 Water street, New York, have placed at the front of their sample room a new range which they manufacture under the name of Perfect. The range is adapted to the building trade where something cheaper than their well-known Perfect range is required. This range is adapted to the use of a horizontal boiler lying across the top of a warming shelf and connected with a water back in the fire chamber. The range will set in between 33 inch jambs and has six holes on the top with a reversible long center. The range has an oven 16 x 17 inches and 10 inches high. It presents an attractive appearance, the castings being of fine finish, while the letters cast on the oven door forming the name are brightly polished. Below the oven door is a nickel plated oven shelf and the broiler door is also polished and nickel plated.

THE PERRY STOVE COMPANY, 242 Water street, New York, are issuing their new Champion hot plate, which presents some novel features. The top is perfectly level and is perforated, so that a vessel 11 inches in diameter may be used without smothering the gas flame. A central perforated plate 8 inches in diameter is arranged to be readily removed. The top is supported on high feet, placing the burners at a considerable height above whatever the hot plate may rest upon. Excellent combustion is claimed for the burner, which is provided with an adjustable air mixer which may be set when the proper proportion of air has been determined by experiment. Another feature of the burner is that it is made so that it is easily removed from the stove; and the parts are made separable, so that should it become clogged through accident or carelessness, the burner may be scalded, boiled or cleaned as the cook prefers.

WM. KERBY, 4 Peck slip, New York, has secured the store at No. 6, and has enlarged his office and sample room to that extent. He is now showing a line of the Reliable gas ranges, and is also showing the Royal Excelsior portable ranges, which are made in several different styles and sizes. Some of the conveniences are water back, end ash pit, enameled reservoir, which has a faucet for drawing off water, a high shelf with brackets and high hot closet.

THE CENTRAL OILGAS STOVE COMPANY are issuing a 96-page catalogue of their gas and oil heating and cooking appliances. The first 20 pages are devoted to various kinds of lamp oil stoves for cooking and heating. The next 30 pages are devoted to their Oilgas vaporizing cook stoves, a new stove being shown in the Junior type, which is shown this year for the first time. Their high stove has been changed in ornamentation, and is very attractive this year. Another new stove is their sheet steel circular burner central draft oil stove, which is made with 8 and 10 inch wicks. Then ten pages are devoted to gas ranges, broilers, griddle stoves, tailor stoves, and several designs of hot plates. These are followed by several pages devoted to glass and sheet metal reservoir oil cook stoves and the various appliances adapted for use in connection with them. Twenty pages are given to description and illustration of a line of cast iron oil cooking stoves. Another new production is shown in their Parlor Vase oil heater, which is followed by their Parlor Dome and the Globe and Florence parlor heaters. The remaining pages of the book are de-

voted to gas and oil heating stoves, laboratory apparatus, solder furnace, glue heaters, lanterns, and gas stove appliances.

A NEAT ORDER BLANK in tablets is being furnished to the stove trade by F. M. Borden & Bro., 118 North Second street, Philadelphia, who make a specialty of stoves, stove repairs, summer cooking goods and refrigerators. The trade have found these order blanks of great convenience.

THE WILLIAM MILLER RANGE & FURNACE COMPANY of Cincinnati are favoring their friends in the trade with an advertising novelty which serves a useful purpose as well, being a constant reminder of the sender. It is a lead pencil upon which is stamped in gilt letters the following inscription: "Buy Miller Monitor Ranges and Furnaces. The William Miller Range & Furnace Company, Cincinnati, Ohio."

J. H. CORT & SON, Adams and Water streets, Brooklyn, N. Y., are issuing a new 26 page catalogue in a red cover of their gas cooking stoves and appliances. After a spring and summer introduction, a description is given of their patent gas burner, special attention being called to the non-clogging feature of the burner and the frictionless construction of their air mixer. An entirely new range is shown in their 164 and 184 series. This range is made without a water hack. This is followed by a line of cheaper gas ranges, after which a variety of gas hot plates, broilers and tallor stoves are illustrated and described.

CHARLES NOBLE & Co., Philadelphia, are sending out a 12 page booklet, descriptive of their new line of Home and Prize Liberty ranges. The booklet is tastefully gotten up and well illustrated. The different styles of the ranges are shown and the extras explained so that dealers and others interested may easily understand the extent of the line.

THE MILWAUKEE GAS STOVE COMPANY of Milwaukee, Wis., favor us with a copy of a 32-page pamphlet which they have issued relative to their Perfection gas ranges, radiators, heaters and broiler grates. Among the opening pages we find an illustrated description of the Perfection burner, directions for using a gas stove and a summary of advantages resulting from the use of gas for fuel. The Perfection range is offered in a variety of sizes and styles adapted to meet different requirements and embodying the modern features. The Perfection portable stoves and hot plates are also considered, together with an attractive line of gas grates, gas radiators and gas heaters. Several pages are devoted to soldering furnaces, flat iron heaters, ovens, &c.

RATHBONE, SARD & Co. of Albany, N. Y., favor us with a copy of a pamphlet relative to Acorn ranges for 1895. The pages measure 9 x 12 inches, permitting the use of good sized cuts, and are stitched together at the back by means of a white silk cord. The printing is in colors, producing a rich and artistic effect. The National Acorn range of the square and standard oven series is illustrated and described, engravings being presented showing the method of removing the grate bars without disturbing the linings or water front. The Magnet Acorn, a substantial six-hole construction with carved ornamentation and nickel trimmings, is also considered, together with the Puritan Acorn and the New Duplex Acorn. The latter is a distinctive design, and

in the ornamentation acorns are employed with pleasing effect. It is a four-hole range with broad burnished edges, double centers and heavy covers, drop broiler door, large fire box, double draft duplex grate and capacious ash pan. The Steel Acorn is the name of a six-hole wrought steel range of neat and substantial appearance. It is made in three sizes with ovens measuring 18, 20 and 22 inches. The top is cast iron with heavy covers and T-plates. The body is lined with asbestos and all oven plates are reinforced. The duplex grate is used in the brick lined fire box, and as the fixtures of the latter are common to all sizes it is a comparatively easy matter for the dealer to carry repairs. The Magnet Acorn and the Senator are other ranges considered in the pamphlet under review.

THE PENINSULAR STOVE COMPANY of Detroit, Mich., are calling the attention of the trade to their new Home and Domestic ranges by means of some attractive circulars which they have just issued from the press. The Home Peninsular is a four-hole construction having either duplex, dockash, draw center or flat grate, and is intended for using coal, coke, wood or natural gas as a fuel. It has large oval fire box, which is extra lined, a large square ventilated oven and capacious sheet flues. It is made in four sizes and the usual modifications. The Domestic Peninsular is a six-hole range of attractive ornamentation, and is referred to by the makers as "a quick baker, superior cooker, rapid seller, and a profit maker." It embodies features similar to those mentioned in connection with the Home and is intended for using the same kind of fuels.

RATHBONE, SARD & Co., Albany, N. Y., have recently resumed operations at their works, starting with about 100 men, which number will be increased as the demands of the trade warrant.

A NEW INTEREST composed largely of Cleveland, Ohio, capital has purchased the business of the Ellwood Gas Stove & Stamping Company, at Ellwood City, Pa., and the style of the concern has been changed to the Ellwood Gas & Vapor Stove Company. The concern are under entirely new management. Additions to the equipment have been made and the capacity of the plant is being largely increased.

A VISIT to 9-11 Desbrosses street, New York, finds Luther & Lederhos occupying a building 80 feet front and 200 feet deep, the front of which they use for an office and showroom. The space back of the showroom is used for storing their large and varied line of gas and oil cooking and heating stoves. Back of the storehouse is their construction department, where the parts of the stoves are fitted and the stoves put together. Here they have power machinery for the purpose, and they are now busily preparing for the summer trade. Their showroom shows a number of attractive stoves. At the front of the showroom is their line of Enterprise gas heating stoves and radiators. Arranged on a high platform along the center of the room they show the Surprise, Leader, Hero and Enterprise gas hot plates, and their line of Enterprise oil stoves and lamp stoves. At the back of the showroom, on the floor, is shown a full line of their Enterprise cabinet gas ranges, some with a water heating attachment, and all with the boiler under the oven.

WILLIAM J. H. GLUCK of 218-222 North Gay street, Baltimore, Md., is distributing a neatly printed catalogue

relating to the Reliance gasoline stove. Special attention is invited to the line of single generators furnished with Reliance safety tank and also the low down tank. These goods embody a number of improvements for the season of 1895, and they are offered in sufficient variety to meet the requirements of the trade. In addition to the stoves made attention is given to burners, a repair list of Reliance single generators, ovens, &c. We also have from Mr. Gluck several pamphlets of pocket size illustrating and describing other specialties. Among these may be mentioned Gluck's Non-Explosive oil stoves, the May Queen and the Oil King stoves, ovens, water coolers, oil radiators, market stoves, wash boilers, refrigerators, ice cream freezers, &c.

THE FULLER & WARREN COMPANY of Troy, N. Y., have issued a four-page circular relative to cooking ranges for the spring trade. It is printed in two colors and calls attention to the Stewart ranges, of which many sizes and styles are offered. Among the features noted may be mentioned oval fire box, fitted with the company's patent triple interchangeable grate, thus giving in reality an assortment of three ranges in one; capacious flues, large ventilated oven, patent oven door opener and nickel trimmings. Accompanying the folder is a leaflet, upon which is printed a letter from a customer of the company, who states that he purchased a P. P. Stewart stove more than 29 years ago from Henry Parsons & Co. of Hoosick Falls, N. Y., and that he has used the same griddles, the same grate, the same center pieces and the same copper reservoir that went with the stove. The damper rod has once burned off, but in the many years that the stove has been in daily use on the customer's farm he has not expended more than \$1.50 in repairs. Wood has been burned in the stove, as he states that the farmers in his locality have that fuel in abundance and prefer it to coal. In commenting upon this letter the company state that such cases are frequently brought to their attention, and that many families are still using P. P. Stewart stoves which were purchased long before the war of the Rebellion.

G. H. HOLLIDAY of Ironton, Ohio, is said to have recently visited Athens in that State for the purpose of forming a stock company for the erection of a large stove and range works at Athens. It is stated that the new company would have a capital of \$30,000 and would employ 40 skilled workmen.

THE APRIL CALENDARS distributed by the Joliet Stove Works, Joliet, Ill., consist, like their predecessors, of blotting pads, one side being embellished with advertising matter printed in two colors. Upon one pad there is a half-tone engraving of Moore's Extra four-hole cook stove made with and without front feed, and the other pad makes reference to Moore's air tight heater, the 1895 pattern of which is referred to as "brim full of solid merit and selling points."

THE TROY NICKEL WORKS, Troy, N. Y., are issuing a rather startling announcement relative to their financial condition. It appears in bold face type printed in red upon the back of a postal card and reads as follows:

WE HAVE MONEY TO BURN,
But We Ain't Going to Burn It.
DON'T BE DESPONDENT:
Brace Up And Be A Man.
LOOK UP YOUR WANTS
And Send Your Orders To
TROY NICKEL WORKS,
TROY, N. Y.

TRADE REPORT.

The Iron Market.

As expected, there has been considerable buying of Lake Superior Ore during the past week, the amount involved aggregating about 2,000,000 tons. By far the greater part of this was taken by the leading Chicago interest, the balance being to smaller purchasers. So far as can be learned, the principal Pittsburgh producers, the Wheeling furnaces and the makers in the valleys have not yet taken hold. The sales covered Norrie at \$2.90, Ashland at \$3 and Chapin. One feature in connection with these transactions is the fact that the guarantee against a decline made by the mining companies covers only the particular grade of Ore sold at the price made.

The course of the leading Mesabi Ore interests is not yet defined. Some of the large consumers have their own mines in that section which they can fall back upon to a certain extent, thus restricting their purchases in the open market. Their own cost of production of metal is not, therefore, lifted to the level of that of others.

Now that the attitude of the sellers of Raw Material is pretty well defined, iron manufacturers and buyers of crude metal are beginning to worry over the question whether Coke operators and Ore companies will be able to keep the peg where they have put it. Buyers of Pig Iron and of Steel are, therefore, holding off to await developments.

Pig Iron.—The market has been quite active in New England, a number of season contracts having been placed. Among them is one for 6000 tons for radiator manufacture, secured by a Virginia furnace. Prices, however, have been very low, \$11 having been done in a number of instances for No. 2 Soft. At the published rates of freight this and other prices made out considerably less at Southern furnaces than the quoted prices supposed to be generally ruling. It is suspected that some special means of securing low rates of freight are available to the sellers. We quote \$12 @ \$12.50 for No. 1; \$11 @ \$12 for No. 2, and \$10.50 @ \$10.75 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.25 @ \$11 for No. 2; \$10 @ \$10.50 for No. 3; \$10 @ \$10.25 for No. 2 Soft, and \$10.50 @ \$10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.50 @ \$10.

A considerable increase in the volume of Pig Iron business is noted in the Philadelphia market. Consumption is larger, and almost everybody seems to want more Iron than usual. There is no reason to suppose that the demand is of a speculative character, as prompt shipments are stipulated for, and there is no marked disposition to engage long deliveries. Prices are steady but not higher, although concessions that might have been had two or three weeks ago are probably not available to-day. The supply, however, is quite ample for current requirements, and while there may be some little stiffening in prices, it is not thought that

any change in quotations will be made for the present. Prices are about as follows for Philadelphia delivery and 20¢ @ 25¢ less for points within a radius of 100 miles South or West:

Standard No. 1 Foundry X.....	\$12.00 to \$12.50
Standard No. 2 Foundry X.....	11.25 to 11.50
No. 2 Plain.....	10.75 to 11.00
No. 1 Soft.....	11.25 to 11.75
No. 2 Soft.....	10.75 to 11.00

The aggregate business in the Chicago district during the past week was considerably larger than in any previous week for some time. The activity was quite pronounced in local Coke Iron. Single transactions are not very large, but buyers were more numerous and the total footed up to quite satisfactory figures. Some buyers have been quickened in their purchases by the advance in Ore and Coke, while others who have for some time been negotiating are holding off in the hope that prices may recede, although they know that for three months local furnaces have firmly maintained an advance on the prices current last summer and fall. The chances are against this, and the Southern furnacemen are already exhibiting a disposition to mark up their prices. Plenty of inquiries are in hand for both local and Southern Iron. Lake Superior Charcoal has recently sold in considerably larger quantities. One furnace company are now in possession of orders for future delivery exceeding 5000 tons. Negotiations are pending on more round lots for season delivery. Quotations are as follows for cash:

Lake Superior Charcoal.....	\$12.75 to \$13.00
Local Coke Foundry, No. 1.....	10.25 to 10.50

The price of Foundry Pig Iron in the Pittsburgh district is higher by about 25¢ per ton, but sales are comparatively light. The situation is still considerably mixed and the market is just in that shape that it is liable to take a sudden turn, up or down, at any time. If it were clearly demonstrated that Coke would hold at \$1.35, higher prices would, it is believed, undoubtedly follow, while, on the other hand, should Coke sag in price, as many believe it will, a reaction in Iron would undoubtedly follow. Quotations on Foundry Irons are given as follows:

No. 1 Foundry.....	\$10.50 to \$10.75, cash.
No. 2 Foundry.....	9.90 to 10.15

Reports from the Pig Iron district of which Cincinnati is the center are gratifying. Consumers are apparently satisfied because prices are low and they are enabled to cover increasing business contracts at prices which will net them a profit, while on the other hand furnaces feel encouraged because of the increased volume of business and the hardening tendency of prices, which facts they believe will eventually lead to greater appreciation and a fuller

employment of furnace capacity. During the past week there have been fewer large orders than for several weeks, but the aggregate tonnage of sales has been but little below the average during March. Of the several hundred orders received by agents, about three-fourths have been from small consumers, and for prompt shipments; the other fourth will represent large buyers whose purchases will, of course, largely outweigh the takings of the others, and the delivery for which Iron extends over a period of four to six months. The bulk of the Iron sold has been to foundries, but consumers of all kinds are represented in the present buying movement: Rolling mills, Car works, Implement makers, Malleable Iron works and Architectural Iron manufacturers. When the business current is received fully, it seems to be of a better character with a more solid foundation and a more confident feeling, even if no advance in prices is secured. Quotations are given as follows:

Southern Coke, No. 1.....	\$9.75 to \$10.00
Southern Coke, No. 2.....	9.00 to 9.25
Southern Coke, No. 3.....	8.50 to 8.75
Ohio Soft Stone Coal, No. 1.....	14.50 to 15.00
Ohio Soft Stone Coal, No. 2.....	14.00 to 14.50
Lake Superior Coke, No. 1.....	11.75 to 12.25
Lake Superior Coke, No. 2.....	10.75 to 11.50
Hanging Rock Charcoal, No. 1.....	16.00 to 16.50
Hanging Rock Charcoal, No. 2.....	15.75 to 16.00
Tennessee Charcoal, No. 1.....	13.00 to 13.50
Tennessee Charcoal, No. 2.....	12.00 to 12.50

The situation in the St. Louis market is showing signs of gradual improvement and the impression is gaining ground that prices have reached a point where a slight advance is assured. The largest producers in the South are refusing to shade prices. Local consumption is increasing and consumers are disposed to increase the size of their orders. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry.....	\$10.00 to \$10.25
Southern Coke, No. 2 Foundry.....	9.50 to 9.75
Southern Coke, No. 3 Foundry.....	9.00 to 9.25
Southern Car Wheel.....	16.00 to 16.50

Metal Market.

Pig Tin.—Prices in the wholesale market advanced early in the week under the influence of conditions similar to those that prevailed last week, spot and current metal delivery rising 0.15¢ @ 0.20¢. Later rates dropped again almost as much, leaving the market at almost precisely the same level as that of a week ago. The demand from consumptive quarters was rather tame, and indications pointed to a supply that is more than enough to go around. To these factors may be attributed the recession in prices. Shipments from the Straits last month were below most calculations, having been only 3300 tons, against 4130 tons in March, 1894, leaving the total since the beginning of the year below the average. Our spot stock is shown to have increased to 2680 tons, but the greater portion is well under control. The visible supply for Europe and America on the 1st inst. was 23,076 tons, against 23,333 tons a month previous and 18,793 tons a year ago. The market closed rather weak. Quotations on small lots of Straits from store are the

same as those given last week—viz., 14½¢ @ 15¢ per lb.

Copper.—Very little change in prices has taken place, but the market shows quite firm undertone under the support of moderately active demand. This is more particularly the case with Lake Superior Ingot. Electrolytic and common casting stocks have met with very fair sale; but the bulk of business is made up of comparatively small orders. Consumption is regarded as being well up to the average for the season, but production is equally full. In retail business inquiry has been better. Prices for small jobbing quantities are unchanged on a basis of 10½¢ for Lake Ingot.

Sheet Copper.—Some good sized orders were placed early in the week, but trade in this department seemed to have relapsed into a condition of quietude later in the week. The volume of business has been little more than moderate taken altogether, but the expectation prevails of an increased demand for Cornice Copper later in the season when building operations are more advanced. Small lots of Sheet Copper from store are quoted at the net list price of 14¢ per lb.

Pig Lead.—Prices have weakened slightly under the influence of more restricted demand and freer offering. The price for small lots of American Pig from store rules at the same level that it has held for some weeks past—viz.: 33¢ @ 3½¢ per lb.

Lead Pipe and Sheet.—A somewhat better feeling is noted among buyers in this vicinity since the resumption of work in the building trades after the strike and the arrival of signs of spring weather. The volume of orders does not, however, show any large increase as yet. It is believed that the conditions are favorable for a good summer business in the line of Plumbers' Supplies. Prices in this section are maintained on the list basis—namely, 5½¢ for Pipe and 6½¢ for Sheet, with a discount of 20¢.

Spelter.—There has been only a moderate business in this market and the demand at present is slow, with little call for larger quantities than single carloads. Prices for small parcels from store remain quite steady, however, with 3½¢ @ 4¢ the range for good Western brands.

Tin Plate.—In some ways business has been more active. Some large orders which have been received from the Pacific Coast have been the leading feature of encouragement to the trade this week. These were, however, of an abnormal or accidental nature, the demand being due to the non-arrival at San Francisco of a vessel with Tin Plate needed for Alaska salmon canning expeditions which are now fitting out and by canners on the Columbia River, whose season is about to open. Otherwise the volume of orders of any magnitude since the opening of the new month had been rather disappointing. Small jobbing business is fairly good, but most consumers still cling to the hand-to-mouth policy in buying which they adopted during the panic times. Prices of imported Plates are more firmly held, owing to the stiffening on the other side following the closing down of many mills. Stocks of foreign material, too, are below the average, but this circumstance has less weight in view of the fact that American Plates are coming into the market in ample quantity to fill any deficiency in this respect.

A special London cable dispatch of April 3 to *The Iron Age* reports on the British Tin Plate market as follows: Tin Plate market more hopeful, but the wages question prevents makers accepting buyers' offers. American inquiry has been large, with buyers offering a slight advance, and Russian orders fair at 3 pence advance on favorite brands. Shipments have been large and stocks are greatly reduced. Last returns gave 182,000 boxes as the total at shipping points. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, 10 14 x 20.....	9 6	③	
Siemens Cokes, 10 14 x 20.....	9 9	③	
Terms, 30 x 30.....	18 7	③	22 6
Charcoals, 10 14 x 20.....	11 7	③	13 6

The following officers were elected by the New York Metal Exchange by a vote of 110 to 40, out of a total membership of 209: For president, John J. Williams of John Davol & Son; for vice-president, Adolph Lawlohn of Lawlohn Bros.; for treasurer, Morton B. Smith.

For members of the Board of Managers: Edmund Hendricks of Hendricks Bros.; William H. Davol of John Davol & Son; Spencer A. Jennings of Bruce & Cook; Robert M. Thompson of Orford Copper Company; B. Hochschild of American Metal Company, Limited; George Nissen of George Nissen; George H. Hull of G. H. Hull & Co.; J. H. Lobdell of J. H. Lobdell & Co.; Charles S. Trench of C. S. Trench & Co.; W. H. Wells of Robert Crooks & Co.; Robert Gentle of Robert Gentle; L. Nachmann of L. Nachmann; Henry H. Adams of H. H. Adams & Co.; George N. Frecker of George N. Frecker.

For Arbitration Committee: J. Mitchell Clark of Naylor & Co.; Fred. Steiner of Behr & Steiner; Charles E. Bidwell of Bidwell & French; T. D. Hazard of T. D. Hazard; George V. Tompkins of George V. Tompkins.

For inspectors of election: S. Mendel, William Hagan, John Deardon.

An amendment to the by-laws was adopted by which the Board of Managers may hold their regular monthly meetings on the second instead of the first Tuesday of each month.

Chicago Report.

Scrap.—A better inquiry is being received from consumers, but actual business is still light. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap.....	\$6.50	
Machinery Cast.....	5.50	
Machineable Cast.....	5.00

CONDITION OF THE

Hardware Trade.

CCHEERING REPORTS from manufacturers and jobbers make it evident that there is a better feeling in business circles and encouraging evidences of improvement. This improvement is seen in some lines outside of the Iron and Hardware interests, which, however, are beginning to feel the effect of a greater confidence and an increasing volume of trade. Reports from representative jobbing houses contain indications of a growing business, and point to the season which is now upon us as one which will be characterized by a generous movement of merchandise. Several manufacturers refer to the business of the past month as having been exceptionally heavy, and some of the factories are working to their full capacity. These are encouraging signs, and with the quickening in the demand which is reported by many houses, some of whom are very busy, the month opens with a promising outlook. In the matter of prices there is little new to report, though there are perhaps indications of a slightly better tone in some lines.

Advices from Chicago.—The orders for shelf hardware steadily grow larger and are also increasing in number. The volume of business for March was much in excess of that of March last year. It is quite significant, as March was the largest month during the whole of '94, and the indications are now that April will show a continuance of the heavy business which characterized the past month. This large volume has been done despite the rather limited demand for staple goods, which, on the contrary, was a conspicuous feature of the spring trade a year ago. It is believed by many that business in staple goods has simply been deferred and that it must be felt later in the season. The reasons for the smaller business this year have not been hard to find. In the first place the cold winter weather was unusually steady, so that outdoor work could not be prosecuted until very recently, and, in the second place, an unprecedented dry period for spring was experienced throughout the whole of the West. The occurrence of mild spring weather and a very general rain have together brought out an improved tone among the Western merchants, and a much larger volume of business in staples is now looked for with a great deal of confidence.

General Tinware is moving quite freely. The demand for builders' Hardware is quite backward, owing to the fact that little has so far been done in the building line, except in a few localities. This movement will come later and will undoubtedly be of large proportions when it does come. The demand for Tin Plate has recently improved very considerably, but so far has resulted in no stiffening in prices. A notable feature of the Hardware trade at present is the improvement in collections, which are now considerably better than at any time for several months.

Notes on Prices.

Wire Nails.—During the week under review there has been, considering the recent large purchases, a good deal of inquiry and a very satisfactory volume of business. Several large orders have been placed, but the demand is principally for lots of moderate size. The mills are well occupied and are looking forward to a steady business during the season. Prices are without change.

Advices from Chicago.—Manufacturers report about the same volume of business as in previous weeks, with very little change in the character of the orders received. Although at no time this spring has the usual rush been perceptible in Wire Nails, the local factories report that the month of March was the largest ever experienced, both as to production and shipments. Jobbers are enjoying a very much better demand for small lots from stock. The carload buyers are by no means fully supplied, so that an increase in the demand from consumers is expected to result in a much heavier movement as soon as it fairly develops. Small lots are quoted at \$1 to \$1.05 from stock.

Cut Nails.—During the past week there has been more inquiry, and the market is characterized by a fairly good tone. A meeting of the Eastern manufacturers was held last week, and the following prices with a 60 cent average were adopted: For carload lots at mill, 70 cents; for less than carload lots at mill, 80 cents, and for similar lots on dock or from store, 90 cents. Where the average is less than 60 cents an advance will be made on the base price. Some of the manufacturers refer to evidences of a reaction from Wire Nails in favor of Cut Nails for certain uses.

Advices from Chicago.—Manufacturers are in receipt of only a moderate business. Small lots from stock are maintained at \$1.

Barb Wire.—The past month was characterized by a large business in Barb Wire, and April opens with indications of a steady demand and a good business. Prices are pretty well maintained, the market being represented by the quotation of \$1.85 for carload lots of Four Point Galvanized at mill. The market is not, however, entirely uniform, and this figure is shaded slightly under pressure.

Advices from Chicago.—The month of March was one of the largest in production and shipments in the history of local manufacturers. This result was accomplished notwithstanding the absence of any appearance of tulle or unusual exertion. Indications at present are that April will be a month of very much the same character. The demand is continuous, although few orders call for anything like the old time large

lots. Jobbers report that their trade is considerably unsettled owing to the offers by competitors of prices under those quoted by manufacturers. The Barb Wire trade is therefore not in as steady and healthy a condition as the Wire Nail trade. But it is hoped that an improvement will shortly take place, when the demand from consumers appears in its usual spring volume. General wire products other than fencing are in active demand, keeping the local works very busy.

Shoe Finders' List.—The Tack manufacturers under date of March 30 have issued a Shoe Finders' list relating to Shoe Nails, Shoe Tacks, &c. It is a complete revision of former lists and is subject to a discount of 33½ and 2 per cent. for cash.

Cordage.—Notwithstanding an improved demand for Cordage prices are somewhat irregular, and the market is rather weak. Quotations for large lots, f.o.b. factory or New York, are as follows, subject to a discount of 1½ per cent. for cash:

Manila, base.....	65¢	7
Sisal, base.....	35¢	4
New Zealand, base.....	35¢	4

Binder Twine.—The Binder Twine market shows no particularly new features, and local demand is somewhat limited. The bankers' Twine continues to be a disturbing influence in the market, and is being distributed, it is understood, to a considerable extent at prices ranging from 4½ to 4 cents per pound in carload lots. Manufacturers of new Twine are disposed to adhere to former prices, the following quotations for car lots fairly representing the market according to the size of the order and the desire of the manufacturer for business:

	Per pound.	
	Cents.	
Sisal.....	45¢	5
Standard.....	45¢	5
Manila.....	55¢	5
Pure Manila.....	65¢	7

Old Metals.—The demand is somewhat better, especially for certain grades of Scrap Iron. Quotations, however, show no quotable change, although they are more firmly held. Dealers' purchasing prices for moderate sized lots, New York delivery, are substantially as follows:

Heavy Copper.....	7b 7¢
Light and Annealed Copper.....	6b 6¢
Heavy Brass.....	4b 45¢
Light Brass.....	3b 35¢
Lead.....	2b 25¢
Tea Lead.....	2b 25¢
Zinc.....	2b 25¢
No. 1 Pewter.....	1b 10¢
No. 2 Pewter.....	1b 55¢
Wrought Scrap Iron, gross ton.....	\$7.50 @ \$8.00
Heavy Cast Scrap.....	gross ton.....
Stove Plate Scrap.....	gross ton 5.00
Burnt Iron.....	gross ton 3.00

Old Rags, Paper, &c.—The general condition of the market is unchanged, and dealers' purchasing quotations do not vary from these made last week, namely:

No. 1 White Rags.....	7b 3¢	@ 3½¢
No. 2 White Rags.....	7b 2½¢	@ 2½¢
Mixed Rags.....	7b 2¢	@ 1¢

Index to Reading Matter.....Page 36.

Hasty Strikes.

The strike which tied up nearly all the surface railroads of Brooklyn during the month of January has been the subject of investigation by a special committee of the New York State Assembly. This committee has just handed in an exhaustive report on the matter which, whatever may be thought of the value of the conclusions and recommendations offered, contains at least one significant statement which is worthy of repetition as illustrative of the tendency of strikes in general. In connection with the failure to agree and the sudden declaration of a strike the committee says: "Arbitration had not been resorted to and not even suggested by either party previous to the declaration of the strike. Had that been done and an arbitration had there is no doubt in the minds of your committee that the entire difficulty might have been avoided."

Prevention Versus Cure.

In view of the history of the strike, as detailed by the committee, this statement is probably true. And it would apply just as truly to many other recent strikes, where the "ounce of prevention" afforded by arbitration or conciliation was not resorted to until a strike, hastily resolved on and carried out, had embittered and hardened the feelings of both parties to the dispute. Then began the "period of cure," represented by heated arguments or stubborn resistance on either side, culminating finally in a more or less unsatisfactory arrangement, after untold loss and trouble had accrued to all concerned. The cost of the Brooklyn trolley strike is estimated as at least \$2,000,000, of which \$750,000 was borne by the strikers, \$275,000 by the city in suppressing disorders, and the balance by the railroad companies

and the public generally. Moreover, of the 5000 men who went out not more than 10 per cent. recovered their places. All this would most likely have been avoided by a little prudence and forbearance on the part of both employers and employed, giving time for a possible amicable adjustment of their differences.

Ideals.

We all have our ideals, be they high or low, but in how few cases do they so dominate our lives as to essentially change them for the better! The boy entering upon a trade or a profession or starting at the bottom of the ladder in a mercantile house is seldom without his visions of his later years of success. That he does not reach the goal of his ambition may be perchance because his ideal was beyond his reach, but far more likely because he failed to strive for it with undivided purpose. Altogether too likely he has looked upon riches as the acme of success. But let him for a moment look back upon the lives of great men. In how few instances were they even wealthy and in what single instance is a man long to be remembered simply because he was rich in worldly goods. The ideal of a good education and an upright character is one that can be reached by all and forms the substantial foundation upon which all future success must be erected. The young mechanic may well seek to be the best workman in the shop, to know more about the why and the wherefore of his methods of work than any one else, to have the credit of making the fewest mistakes. These are perhaps but lowly ideals compared with some of our air castles, but they will sooner or later put the man in charge of others. But this means work, and study too, outside of working hours; it means the exercise of the powers of observation; it means that during the hours of labor the work must receive the undivided attention of the workman, and it means, above all things, the utmost patience. Such results as he strives for cannot all be secured in a day; it will take months and years too, but with life spared he may always climb higher.

Municipal Control of Gas.

Mayor Stuart of Philadelphia, in his fourth annual message, recently issued, gives a very favorable report of the working of the Municipal Bureau of Gas in that city. From the statistics contained in the mayor's report it appears that the total expenditures of the bureau, from 1891 to 1894 inclusive, for material, labor, supplies, coal, &c., were

\$10,858,910.58, and for extensions and permanent improvements, \$1,050,248.81, making a total of \$11,909,159.39. During the past four years there has been turned into the city treasury, as receipts from this bureau, \$14,790,404.25, or very nearly \$3,000,000 in excess of the entire expenditures. This is considered a very favorable showing in face of the fact that the price of the city gas in 1894 was reduced from \$1.50 to \$1.00 per thousand feet, a decrease of 33 1/3 per cent. in price. From 1891 to 1894 the Bureau of Gas has furnished, in addition, the various municipal departments, and for street lighting, 2,407,308,398 cubic feet of gas, for which the bureau received no credit at all, and which, had the city been compelled to purchase at even one-half the price paid by private consumers, would have cost \$1,649,651.

Trade Education in India.

An East Indian exchange states that Lord Elgin, the present Viceroy of India, is very much interested in trade and technical education. He has under consideration the establishment, under government auspices, of schools where the Indian mechanics will be offered opportunities of learning their trades in a more efficient manner than is the case at present. Native workmen are very conservative. A trade or profession is followed in a family from father to son. All the trade education that they get is such as is received practically in the shop from their parents. Consequently but little progress or improvement is made in the mechanical arts in that country, the native artisans keeping in a certain groove which has never altered from age to age. The Government has at last had its eyes opened to the fact that much might be done in this field to improve not only the condition of the workman, but also the quality of the work he turns out, if better opportunities were afforded him of learning his trade by means of such institutions as the trade and technical schools which have proven so valuable in this country and in Europe.

Coal mining statistics for the State of Illinois show that 70 new mines were opened last year and 120 closed or abandoned. Notwithstanding the decrease of 50 in the number of mines, the product at the same time increased 2,087,288 tons. The fact that the number of mines in Illinois is at present 148 less than in 1890, while the output is 4,500,000 tons in excess of that year, indicates that the abandonment of the small mines as unprofitable has largely taken place. The business is now concentrated in the larger mines, with improved facilities for working them. The mining of coal by machinery is rapidly increasing, ten more mines having adopted this system last year than in 1893.

THE LETTER BOX.

Pressure on Kitchen Boiler.

From J. O., *Yonkers, N. Y.*—What pressure is there in a kitchen boiler in which the water pressure is 70 pounds from the mains in the street? It has been described as several tons on a 5 x 12 boiler, but I do not see how this can be.

Answer.—Pressure is usually calculated per square inch, and with a 70-pound pressure each square inch of the boiler has a 70-pound pressure on it. Taking a 12-inch boiler and calculating the area of the head by squaring the diameter and multiplying the result by the decimal fraction 0.7854, it shows an area of 113 inches, and there being a pressure of 70 pounds on each one of these inches, a total of 7910 pounds, or about 4 tons, bears on this head to tear it away from the body of the boiler. A similar pressure is exerted against the head in the other end of the boiler. To find the area in the surface of the boiler multiply the diameter, or 12 inches, by 3.1416 and the circumference, 37.7 inches, will be found. This multiplied by the height of the boiler in inches, or 60, will give 2262 square inches of surface. Against each inch of surface a pressure of 70 pounds is bearing, or a total of 158,340 pounds. This, added to the pressure that is bearing on each of the heads, makes a total of 174,160 pounds, or a little over 87 tons. If such a pressure were brought to bear on any one square inch of the boiler it would be burst immediately, but being distributed at the rate of 70 pounds per square inch all over the boiler, the tensile strength of the material of which it is made readily confines the water in it.

Computing Heating Surface.

From A. G. K., *Canada.*—I would like to ask you how I can calculate the number of feet of $\frac{3}{4}$ inch pipe that must be used in a radiating coil, made with return bends, to heat a room 12 x 14 with a 12-foot ceiling. It is to be connected with a coil in a furnace that will be made of $1\frac{1}{2}$ inch pipe. One inch pipe will be taken from the furnace coil to the radiator in the room, and the $\frac{3}{4}$ inch return pipe will be taken from the radiator to the furnace coil.

Answer.—The room in question contains about 2,000 cubic feet of space; and calculating that one square foot of heating surface will be required for 30 cubic feet of space, it will be seen that as many feet of heating surface will be required as 30 is contained into 2,000, or about 67 square feet of heating surface. This will require about 241 lineal feet of $\frac{3}{4}$ inch pipe. In connect-

ing the coil with the furnace, however, pipe of the same size should be returned from the radiator as is carried to it; and it is probable that if the radiator is made of 1 inch pipe, better circulation and heating will result.

Collapsed with a Vacuum Valve.

From OLIVER TWIST, *Canada*—In *The Metal Worker* of March 16, "M. A. C.," Petokey, Mich., is somewhat puzzled to know what caused the boiler to collapse when it was provided with a vacuum valve. He says "The boiler

Collapsed with a Vacuum Valve.

collapsed while drawing water out of the main." Let us for a minute look at the sketch, which shows a boiler connected as described by "M. A. C." Suppose it to be in its normal condition under 40 pounds pressure, which being suddenly removed and the vacuum valve in working order, the water in the vertical pipe A will run back into the main, leaving the boiler full. If a good fire is on at this time steam will form in top of boiler and gradually force the water up the tube and out into the main, more or less according to the length of time the pressure is off and the condition of the fire, until the boiler may be half full of steam, when the pressure may be again replaced, when the steam will be condensed suddenly, forming a vacuum, which the valve in its present position will not prevent, as it is placed on the wrong pipe. It should be as close to the top of the boiler as circumstances will allow, on the hot water service at B, thus admitting air directly in the top of cylinder.

Public Pumps.

From J. T. C., *Winchester, Ky.*—I would like the opinion of the readers of *The Metal Worker* on public pumps. Before we got water works in our city we used cisterns. Now the city council wants to utilize the water in these cisterns for public drinking purposes; and it is proposed to use some kind of pump in connection with them. The pump must be set from 10 to 15 feet from the cistern. I would like to know what is the best method of putting in the pump to keep it from freezing and what character of pump is best for the purpose?

A Peculiar Furnace Experience.

From S. C., *Cleveland, Ohio.*—In answer to "H. R. D." of Brooklyn, N. Y., in *The Metal Worker* of March 30, I will say that he is all wrong in regard to his double chamber hobby. While we have not constructed a double chamber we have an inside lining (as the sketch in *The Metal Worker* of March 9 will show), carried up to the bottom of hot air pipe, with holes at bottom to allow circulation between inside and outside wall or chamber. His suggestion looks all right, but we have seen cases where double chambers were used and air taken at top or near it, and when the wind would change out would go the hot air to the cold world through the duct. Hot air rises, as we all know, and when you depend on natural law and use construction as "H. R. D." suggests, it has been our experience that the air is just as liable to go one way as another, so we are sure our trouble does not lie there.

Answering "J. W. G." of Clinton, Ill., in *The Metal Worker* of March 23, will say it is next to impossible to connect inside air pipe to outside duct, for, as our sketch will show, they are from opposite sides of house and the cold air duct is underground. As to the dampers, in both cases the inside registers have valves which would act in the same capacity as damper. The cold air duct has hinged valve. But, do you see the point? Our customer does not want to bother himself to regulate valves half a dozen times a day as the wind changes; nor will he do so. As for taking off pipe inside of chamber, I will say that that has been tried, so this not help us out.

To "S. J. P." of Pittsburgh, Pa., will say that we did not reduce size of pipe by a taper piece, running same to 9 inches diameter. We do not think that reducing pipe would do the business, for we can operate valves in registers, reducing capacity. This experience seems to be a corker for all of us, but we will keep at it and get it to work and let you know through *The Metal Worker* how we succeed.

From E. E. PALMER, *Harrisburg, Pa.*—In looking over *The Metal Worker* of March 30 I see that my friend "C. S.," of Cleveland, has not yet conquered his "peculiar furnace job," and although it is a very difficult matter to make a furnace work on paper at so great a distance, I will offer the following suggestions: "C. S.," will not be able to take cold air from the floor of the house and from the outside too at the same time. The air from the outside is colder than that on the floor inside, and therefore the pressure is greater, and if both ducts are open at the same time and only a part of the warm air pipes are used, the outside air, being colder, would press harder against the partial vacuum inside the furnace casing, caused by the heat from the furnace, and drive the air out of the inside pipe or duct the same as though it were a warm air pipe, only in less quantities; and it would not matter whether the pipe extended up inside the furnace casing or not. The fire place when open would only assist such circulation. Now, the way I would advise doing would be to make the inside air face as large as necessary to supply all the heat pipes, then construct an air duct from it to the lower part of the air chamber, the same as though taken from the outside, and place in each duct a good tight damper, so arranged that the air can be taken from either outside or inside, as desired, but not from both at once. Then, with the fire place closed up the inside air flue will work.

Taking the cold air from the floor inside of a room to be warmed to the air heating chamber of a furnace is simply heating by direct radiation, as the air is revolved over and over, warmed and rewarmed, just as it would be if a steam or water radiator or a stove were placed where the cold air face is located, and robs a furnace of one of its most valuable features—viz., providing means for good ventilation in our homes, churches and schools. A thorough knowledge of the laws of natural philosophy which govern air circulation will greatly benefit those engaged in warm air furnace work, and will often lead them to see defects in mechanical appliances that have been looked upon as perfect until failure of them proves their weakness.

Repairing Gasoline Stoves.

From L. R. B.—Will some one inform me through *The Metal Worker* how to repair a new process gasoline stove? The oil drops properly from the tank, but the flames from the burners are unsteady, and sometimes one or more of them will go out and fill the room with a disagreeable odor. The burners are kept clean by brushing them frequently, and seem to be all right, as far as I can see. I have the impression that the trouble is in the conveying pipes, which seem to be somewhat coated with a greasy formation in a place where it is hard to get at. The difficulty I find with people using gasoline stoves is that they let the stove go too long before giving it a good cleaning. They also crowd the stove to too high a capacity or try to make the stove do more than it is capable of doing.

Note.—We hope some of our readers who are using and selling these goods will describe their experience for the benefit of our correspondent. It would seem that the gasoline has been brought to the stove in a can that has been

used previously for kerosene or some other oil, which will produce effects that are not desirable.

A Truck Made of Pipe.

From P. F., *Trenton, N. J.*—I send you a sketch of a truck that I have made of short pieces of pipe and leaky fittings when time hung heavy on my hands. Having a forge in the shop, I flattened two short pieces of pipe and

A Truck Made of Pipe.

welded them together and bent them, as shown at the front of the truck. This pipe was 1½-inch and had ¾-inch holes drilled through it so as to fasten it to the axle, which was made of 1-inch square iron with the ends made round and a collar welded at the inner end of the bearing to hold the wheel. A 2-inch oak block was placed between the axle and the pipe, and was made high enough to raise the pipe above the wheels. One wheel I bought of a junk dealer for 12 cents and the other I had made for 4 cents a pound at a foundry. The shafts of the truck are reduced to ¾-inch pipe at the second cross bar. The cross bars and legs are made of ¾-inch pipe. A left hand thread on one end of the cross bar and in the tees at one side are needed to put the parts together readily. My truck measures 4 feet over all and was made to suit special work.

Well and Cesspool.

From W. H. R.—I would like to have *The Metal Worker* or its readers give some information about a cesspool which I dug 30 feet from a well. The water in the well became riley. The ground is of clay and sand and level. I am not experienced in this kind of work, and would like to know if the cesspool would affect the well, and what is the best thing to be done in such a case.

Answer.—The answer to this question is very simple. The best thing to do is to stop using the water in the well immediately. It is in every way dangerous to have cesspool and well so close together, as the contents of the cesspool will percolate through the ground, especially if it is soft material, such as our correspondent mentions, and will pollute the well in very short order. Safe distances will depend upon the

depth of the well. It will be quite evident that a cesspool 10 feet deep and a well 10 feet deep, placed 50 feet apart, in soil in which the strata were horizontal, would not directly affect one another—that is, the seepage from the cesspool would not flow directly into the well, as it goes off at an angle from the bottom of the cesspool. It would, however, be liable to contaminate the general water supply, and thus in an indirect way foul the water in the well. A hundred feet is none too distant for a cesspool, and, wherever placed, the safe plan is to cement the cesspool tight and clean it frequently.

A Rustic Steam Connection.

From TRANSLANTED, *New York.*—Herewith is a sketch of some work that was done to a steam heating system in connection with a steam boiler that was installed by a New York firm in a country residence. After the job had been completed and used some time the owner desired an extra radiator for his conservatory and employed a country plumber to make the necessary connection. He made one valve serve for two radiators by putting a 1½-inch T between the radiator and the valve, leaving the side outlet on the T horizontal. From this outlet a pipe was run with a downward pitch to the conservatory, and connected with a seven-loop radiator, as shown. He then took a 1-inch drip pipe and let it discharge the condensation from the radiator into the grounds. As a result nearly all the

A Rustic Steam Connection.

water was run out of the boiler, and the owner had to fill his boiler with water twice a day before we received an order to investigate the trouble and correct it.

Cement for Marble and Basins.

From F. H. W., *Cortland, N. Y.*—In *The Metal Worker* of March 9 "E. S. N." asks for a cement for fastening bowls to slabs. If he will take dry white lead and mix with varnish, then set the parts close together and clean with waste and gasoline, he will have a job that will not give him any trouble, either from staining the marble or from cracking loose.

STEAM AND HOT WATER.

Hot Water Heating Plant at Oregon State Reform School.

The hot water heating plant in the Oregon State Reform School at Salem,

architect, under whose supervision it was completed. F. H. Bryant, the engineer of the school, was appointed to look after the carrying out of the heating contract in the interest of the

ment of the building with the flow and return mains, the boiler being set in a cellar under the basement. Fig. 2 shows the plan of first floor, with the size and location of the radiators. Fig.

Fig. 1.—Plan of Basement, Showing Flow and Return Mains.

Fig. 2.—Showing First Floor and Location of Radiators.

HOT WATER HEATING PLANT AT OREGON STATE REFORM SCHOOL.

Ore., will be of special interest to our readers, as it is said to be one of the largest hot water plants on the Northwest Coast. The building was erected from plans made by W. C. Knighton, the

State. The constructing engineers who erected the plant are the Dugan Bros. Plumbing & Heating Company, 59 Main street, Salem, Ore.

Fig. 1 shows the plan of the base-

3 shows a similar plan of second floor. Fig. 4 shows third floor, only a portion of the north wing being heated.

The system of heating is of the low pressure type with the expansion tank

placed in the rear tower of the main building. Two 48 inch x 16-foot horizontal steel boilers are used, each having 68 3-inch tubes. The boilers were made by the Kewanee Boiler Company, Kewanee, Ill., and are rated to carry 22,000 square feet of radiating surface. The boilers are set side by side in brick work, but independent of each other. The smoke, instead of being taken from the front of the boiler is carried from the top of the boilers under a brick arch and connected with the main flue

dining room on the first floor and the stage on the second floor.

Fig. 6 shows the method of connecting the return mains to the boiler. A 3-inch return from the radiators in the dining room and stage connects into the 6-inch horizontal main at one end, with a connection on it which receives the pipe from the expansion tank. The 8-inch return main from the radiators in the principal part of the building runs into two 6-inch branches which connect with the boiler, as shown.

into an 8 inch return pipe, where it drops down. This is carried underground to the sub-basement in the north wing, there to be suspended from the joists, and is taken to the boilers, where it is connected as shown.

Where branches are taken from the flow main in the north wing the connections are made as shown in Fig. 7. This character of connection was adopted to prevent the main from being robbed of the hottest water so near to the boiler, and to aid in securing a

Fig. 3.—Showing Second Floor and Location of Radiators.

Fig. 4.—Showing Third Floor and Location of Radiators.

HOT WATER HEATING PLANT AT OREGON STATE REFORM SCHOOL.

at the rear. By this method it is claimed that a lower temperature is shown in the smoke flue than in the flow mains from the boiler. A smoke flue 30 x 30 inches and 70 feet high has been constructed for the use of the boiler alone. All the connections between the two boilers are such that either one may be used independently of the other. A special arrangement has been made for cleaning the flues.

A 6-inch flow main is taken from the top of each of the boilers, as shown in Fig. 5. These merge into an 8-inch flow main, which is used to heat the principal part of the building. A 3-inch main is taken from the 6-inch horizontal main to heat the back part of the

A thermometer is placed on the flow main at the point where the 8-inch pipe begins. The 8-inch flow main is carried directly upward from the top of the boilers in the cellar to the ceiling of the basement, and is then run along the ceiling, as shown in Fig. 1, having a downward pitch. The main continues 8 inches in size the whole length of the north wing, making a turn to the main building, where it is divided into two 6-inch branches, a twin ell being used at the branch. One of these branches runs to each side of the main building. They continue until the south wing is reached, where they make right angle turns and run toward the back, where they run toward each other and merge

higher temperature in the radiators further along the line. In the south wing the branches to the risers are taken from the top of the main, and the return pipes from the radiators are connected into the side of the main, as shown in Fig. 8. The basement radiators are fed by the return from the radiators directly above them, the connection being made at the top and the return at the bottom, as shown in Fig. 9. The valves and by-pass shown in Fig. 9 are intended to be used when no circulation is desired through the radiator.

In the north wing and main building the returns from the radiators are carried directly into the 8-inch return

main, but in the south wing the flow and return pipes are connected with the 6-inch flow main, as shown in Fig. 8.

Each set of rising pipes, both flow and return, is provided with an open way valve and bleeder, which permits of any set of radiators being shut off and disconnected when desired without affecting the working of the plant. There are 82 radiators distributed throughout the building, and when the plant is in operation, with the water at 120°, a remarkable evenness is shown in the temperature of the different radiators. The radiators in the south wing at the extreme end, a distance of over 270 feet from the boilers, are practically as warm as those nearer the boiler.

All the radiators are tastefully decorated with a maroon enamel and gold, and Chicago quick opening valves are used in connection with them. Previous to the erection of the north and south

Circuit Systems of Hot Water.

From SAMUEL HEINS, *Rondout, N. Y.*—I would say a few words on the circuit system of hot water as "Piper" Illinois, in *The Metal Worker* March 23 asked such a foolish question and wants to know if it is practicable to pipe hot water heaters on the one-pipe system. I will tell him no. There are scarcely two jobs out of every ten that will work satisfactorily unless put up by an expert. It is the most difficult method of heating a dwelling, and where it would heat one dwelling it would not heat another; it is according to the location. I never approved the one-pipe system, for I am a great advocate of the two-pipe system all the time, though I have seen one-pipe jobs work very satisfactorily and I have done a great many jobs on that system;

that the radiator nearest to the boiler or heater becomes hotter than those at the extreme end. I may say, where a circuit system is properly proportioned there may be satisfactory results. It may be like some jobs that are now installed in dwelling; some work perfectly, while others work very unsatisfactorily because the job was done by men who never served an apprenticeship at the business. Some time ago, in Palmyra, N. J., I was called to a house to make an examination of a steam heating job. In the first place, the man who did the work was an artist who owned the house, and he thought he would save a little money by doing the job himself. After doing the job (and he thought he was a steam fitter) it would not work and he tried for a couple of months to make it work. As he was using a ton of coal a week and not getting satisfactory results from

Fig. 5.—Showing Method of Connecting Flow Mains.

HOT WATER HEATING PLANT AT OREGON STATE REFORM SCHOOL.

wings the main building was heated by steam, but when the new buildings were completed, the hot water plant was substituted. The work of installation was completed in September and the plant turned over to the State officials, who, after the cold weather had tested the plant, expressed their approval of the job in letters sent to the Dugan Bros. Plumbing & Heating Company. One letter signed by the Board of Trustees of the Oregon State Reform School, consisting of Governor Sylvester Penney, Secretary of State George W. McBride and State Superintendent of Public Institutions E. B. McElroy, spoke of the contract, which amounted to \$15,200, having been completed to their utmost satisfaction and to the satisfaction of all concerned, and a second letter, signed by R. J. Hendricks, superintendent of the Reform School and F. H. Bryant, engineer, refers to the excellent workmanship shown in the job and its economical consumption of fuel, it taking, in their belief, "less than half the wood that a steam plant heating the same rooms would require."

but you cannot get as good results from the one-pipe system as you can from the two-pipe system. If a person wants a cheap job, use the one-pipe system; if they want the most perfect job, use the two-pipe system. Let me say to "Piper," if he is not a thorough mechanic in this line of work do not undertake it. If he does he will make a failure out of it; he would have to use much larger pipe. In proportioning circuit mains I would use the area of 1 1/2 inch pipe for each 100 feet of radiation, which I consider better proportion. The answer given to "Piper" says: "The main has a considerably larger area than the connections to the radiators, permitting the water which is returned cool from the radiators to flow along the bottom of the main without influencing the hotter water in the upper part." The same may be said of the one-pipe system of steam heating; the steam being so much lighter it passes along the top of the pipe while the condensed water, as it may be called, passes along the bottom of the pipe. It stands to reason, therefore,

it he thought he would give up the job as a steam heating plant and make a hot water heating job out of it. He put an expansion tank on top of the highest radiator. Instead of setting it on the shelf above the radiator he thought it would answer if he made a shelf out of the radiator. After spending another week he made a complete failure out of it and I was called to see what was the cause of getting so little heat and using so much coal. In my examination I found he had pockets and depressions in all the pipes. I also found that he did not have his connections to the boiler right. He used all elbows instead of 45° elbows. I must say it was a "holy terror." After all of his hard work and many a day of cursing and skinned knuckles he had to acknowledge he would not make a steam or hot water fitter. It cost him \$125 to overhaul the plant and he had to pay a mechanic to do the work. It is the same with work done by men who profess to know something about this kind of work and claim to be steam and hot water fitters and could not tell how

much water 1-inch pipe 3 feet long would hold, or the difference between a high pressure and a low pressure plant. There is a great deal to learn before a man becomes a steam and hot water fitter. I claim that the circuit system of hot water heating is only in its infancy, and it will require a great deal of hard work and a clear head to make it work perfectly. No one-pipe system will give as good results as a two-pipe system, and not only that but it is a much easier work to put in a two-pipe system than it is to put in a one-pipe system. In many cases alterations have to be made before satisfactory results are obtained. I would like to hear further from my fellow workmen on this subject, although I don't believe it will be used to a great extent.

Bigley's Patent Hot Water Heater.

The Brand Stove Company of Milwaukee, Wis., and 77 Lake street, Chicago, have secured the sole agency for the United States of the Bigley hot water heater, which is herewith illustrated. This hot water heater is designed to be used with a warm air furnace in combination heating. It is so shaped as to fit above the fire in the furnace, so that no coal or ashes gather round it to interfere with its heating surface. It is made in three sizes, so that it can be fitted to almost any warm air furnace. It is not necessary for the heater to rest on the fire pot, as the mains and returns will keep it in position.

As will be seen in the illustration, the heater is cone shaped, having two inlets and two outlets. Partitions are

Bigley's Patent Hot Water Heater.

placed between the heads, as shown in the parts broken away, so as to cause reverse circulation of the water passing through the heater and increase the velocity of the water in its circulation. Resting in the center of the hottest part of combustion, it is apparent that even a small fire in the furnace will have an effect on the water in the heater. It is made of cast iron, in two pieces, having but one joint, which is securely bolted together, rendering the heater steam and water tight. Each heater is tested to 150 pounds pressure. They are built strongly so as to be durable.

Vanderman's Expansion Tank.

The expansion tank shown herewith is manufactured by the Vanderman Plumbing & Heating Company, Willimantic, Conn. This tank is designed

Vanderman's Expansion Tank.

to avoid the offsetting of pipes, which is required where the ordinary round tank is used. It is made of cast iron, in two pieces, joined together with a durable joint in such a manner as to make it practically a one-piece tank. It is attached to the wall by means of projecting lugs, drilled to admit screws or other fastenings. This arrangement dispenses with the use of brackets or shelves and permits connections with the tank to be made at the wall, instead of carrying them to the center of

Before leaving Gurney & Company Mr. Armstrong was presented with a handsome marble clock by the staff of that firm, and both employers and fellow employees joined in wishing him success in his new venture.

HEATING NOTES.

On the morning of Tuesday, April 2, the workshops of the Illinois Safety Heating Company were partly destroyed by the disastrous fire which visited St. Charles. A number of valuable drawings and patterns of the company's new heater were consumed. Temporary quarters have been secured and the company hope to get their samples ready for exhibition within three or four weeks. The fire is supposed to have been caused by tramps lodged in an adjoining mill. Seventy-five thousand dollars' worth of property, mostly owned by stockholders of the company, was consumed.

THE project of Councilman Downie to heat the school buildings of Cleveland, Ohio, with natural gas has been abandoned.

THE DIAMOND BOILER COMPANY, Holliston, Mass., distribute illustrated catalogues of the Diamond horizontal tubular boiler of their manufacture. These boilers are illustrated by general and sectional views, also detailed views of the connections as well as special views of the individual sections, altogether presenting it very thoroughly. Along with the illustrations are complete descriptive particulars, so that any one can get a full comprehension of the design and operation of the apparatus. The boilers are made in seven sizes, with the grates 16, 19, 23, 27, 32, 38 and 48 inches wide, and with these different widths of grates they are built up with various numbers of sections which give, altogether, nearly 50 capacities of boilers to choose from.

THE AMERICAN DISTRICT STEAM COMPANY, Lockport, N. Y., have just received a contract to extend the big steam heating system which the company put into Scranton, Pa., last year. The contract is for \$25,000. A smaller extension will also be put into Wilkes-Barre, Pa.

W. M. MACKAY, the manager of the steam and hot water department of Hart & Crouse, Utica, N. Y., at 211 Water street, New York, was furthering the interests of the Royal line of steam and hot water boilers at Washington, D. C., this week.

N. E. FROST of the New York office of Smith & Winchester, Boston, visited the steam and hot water heating trade in Philadelphia this week in the interest of the Winchester boiler.

THE SHOW WINDOWS at 61 Gold street, New York, bear the lettering: "W. H. Page Boiler Co., Alexander Don, Manager. Volunteer, All Right, and Sectional Steam and Hot Water Apparatus."

THE PLANS and SPECIFICATIONS for replacing the steam heating apparatus at the Mission Church of the Redeemptorist Fathers, Tremont street, Boston, with a hot water heating apparatus were made by W. M. Mackay. Several bids were received for heating the building, and the contract has been awarded to T. B. Cryer & Co., 11 Division street, Newark, N. J., who will use two large size Royal heaters and 6075 square feet of radiating surface. The heating plant will be in-

the tank, as in the old custom. The tank has the usual number of inlets and outlets and is furnished with or without water gauge, as desired. Patents on this device are pending. The tank is made in four sizes, viz., 7, 10, 12 and 15 gallons.

FRED. W. ARMSTRONG, late "heating engineer" of the Gurney foundry, Toronto, has severed his connection with that firm and entered into partnership with Messrs. Worthington & Garratt, plumbers, Bay street, Toronto.

stalled under the supervision of Mr. Mackay.

THE S. WILKS MFG. COMPANY, 113 to 123 Clinton street, Chicago, report large sales of hot water heaters, particularly those of large size. Their sales for March were double those of the corresponding month of the previous year.

T. C. Joy & Co., Titusville, Pa., are issuing a 40-page catalogue on enameled paper with a yellow enameled cover. A design is used on the first cover in which their firm name is incorporated and their new Zenith radiator is shown. A feature of the design is the words "Practical Tests." On opening the book, it is found that the practical tests allude to half-tone engravings showing numerous large buildings in different cities of the United States in which their loop and flue radiators have been used.

The New Rococo Radiator.

The American Radiator Company have just added to their extensive assortment the new Rococo three-

for heating and ventilating the new Brookline High School, a \$350,000 building. A feature of the heating will be a coil of 7000 feet of 1-inch pipe, into which fresh air is received, heated and distributed throughout the building. Four 200 horse-power boilers have also been put in.

Charge for Boxing and Cartage.

When a Chicago importer gets a bill for goods shipped from London, says the *Tribune* of that city, he finds charged up to him the cartage and the box in which the goods are shipped—perhaps even the nails and the iron strip with which the box is held together.

"I think this practice is the correct one," said a local importer. "It is the product of a higher commercial development than ours—a better, more thoroughly organized system. It is a system in which the element of guessing in figuring up a year's income and expenditures is practically eliminated. The practice prevalent in this country of selling goods f.o.b. is not the sound

a box down to the very nails and then charging it up. If he did this, moreover, his customer would probably think him small and close fisted and be inclined to take his trade somewhere else.

"I believe in our glorious institutions; I spent three years fighting for them some 30 odd years ago; but I am not blind to the fact that our British cousins do a good many things, particularly in the commercial line, better than we do. It is this very close fistiness, if one chooses to call it so, this dealing on close margins, that has helped them into their domination of the entire commercial world. Science is accuracy in business as in everything else. The man who succeeds is the man whose aim is true, who, like the Benjamin slingers, can throw at a hairbreadth and not miss. He doesn't guess or approximate, particularly in the matter of expenses."

New York Trades School Badge.

An effort has been made by the graduates of the different classes of the New York Trades School, Sixty-seventh street and First avenue, New York, to

The New Rococo Radiator.—Fig. 1.
—General View of Radiator.

Fig. 2.—Middle and End Loop of Radiator.

column radiator, for steam and water, a general view of which is shown in Fig. 1, while views of the middle and end loops are shown in Fig. 2. Each section of 38 inches in height contains 5 square feet of heating surface; width, 10 inches; length occupied in stack, 2½ inches. Two-inch nipples are used in connecting the sections. The construction is such that in the outer tubes, where the greatest demand is made for heat to be imparted to the surrounding air, there is a larger body of water; while under the center column or veiled surface, where there is less demand made for heat, there is less water space in the tube. The shape of the section is convex and is trussed from the outer columns to the center one, to increase strength. A descriptive circular and price-list of the Rococo will be forwarded on application to the American Radiator Company, 111-113 Lake street, Chicago.

KENRICK BROS., Brookline, Mass., are rapidly completing their contract

one, and every necessary expense which is 'thrown in' by the seller as an inducement to the buyer marks a step in the wrong direction. And if there is any profit in this way of doing business it goes not to the buyer, as he may imagine, but to the seller, because the latter, in figuring the price of an article, is sure to make a liberal allowance on his side of the fence to cover the cost of this concession. He has never estimated exactly what a box of given dimensions does cost him, but he will make a guess at it in establishing prices which is sure to cover it and a little more.

"The practice comes not from any desire to make money in boxes, I think, but from the large handed way of doing things in this country. In older countries, like England, men are content with earning smaller percentages on their investments and they figure more closely, while in the United States the average business man looks for much larger returns and thinks it a waste of time to be getting the cost of

secure some means of continuing the acquaintance formed at the school and of identifying each other. This aim has met the approval of the trustees, who, to aid in attaining the object, have adopted the badge shown in our illustration, and which can be procured by such members of the classes as desire to be identified with the school after they have left it and become engaged in work at their several trades. Our illustration is of the same size as the badge, which can be furnished in three different styles. One style is silver and will be sold at 75 cents. Another style is heavy gold plate, which is sold at \$1.25. It is also furnished in gold at \$2. Members of past classes can secure the badge bearing the date 1895, while future classes will be provided with a badge bearing the date of the year in which they graduate.

New York Trades School Badge.

The Navy Department at Washington has issued the following statement of the present condition of the new United States war vessels. The figures represent the percentage of completion: "Amphitrite," 99 per cent.; "Maine," 98 per cent.; "Terror," 96 per cent.; "Texas," 95 per cent.; "Indiana," 93 per cent.; "Massachusetts," 90 per cent.; "Katahdin," 90 per cent.; "Oregon," 89 per cent.; "Puritan," 87 per cent.; "Monadnock," 85 per cent.; "Brooklyn," 42 per cent.; "Iowa," 35 per cent.; Gunboat No. 7, 31 per cent.; Gunboat No. 9, 26 per cent. and Gunboat No. 8, 25 per cent. Since January 1 the "Minneapolis," "Cincinnati," "Raleigh," "Olympia" and "Ericsson" have been taken from the list of uncompleted ships. All have been commissioned and put into regular service except the "Ericsson." The "Amphitrite" will be commissioned next week, leaving but 14 naval vessels under construction.

TIN PLATES.

Tin Plate Calculations.

The unprecedented drop which has taken place within the last year or two in the price of tin plate has rendered practically useless all tables previously published for the calculation of prices, weights, &c., any rate below \$4.50 a box for full weight, 14 x 20, 1C plates not having been contemplated by the compilers of such tables. For this reason a circular recently issued by the American Tin Plate Company, Elwood, Ind., containing rules for calculating prices, weights and quantity of tin plates, is very timely and will be found extremely useful to the trade. The rules given therein, which we print for the information of our readers, are as follows:

Base Box Tin Plate.

112 Sheets, 14 x 20, 280 inches per Sheet,
31,360 inches per Box.

Weight.....	100 pounds.
1C.....	108 pounds.
1X.....	136 pounds.
1XX.....	157 pounds.
1XXX.....	178 pounds.
1XXXX.....	199 pounds.

Prices.

Rule to Find the Price of a Given Box of 112 Sheets.

Multiply the number of square inches in the given sheet by the base price. Divide the result by the number of square inches in the base sheet. Result will be the price of the given box.

Rule to Find the Price of a Given Box of More or Less Than 112 Sheets.

Multiply the number of square inches in the given box by the base price. Divide the result by the number of square inches in the base box. Result will be the price of the given box.

Rule to Find Base Price, when Value is Stated, of a Given Box of 112 Sheets.

Multiply the number of square inches in a base sheet by the price of the given box. Divide result by number of square inches in the given sheet. Result will be the base price.

Rule to Find the Base Price, when Value is Stated, of a Given Box of More or Less Than 112 Sheets.

Multiply the number of square inches in a base box by the price of the given box. Divide result by number of square inches in the given box. Result will be base price.

Weights.

Rule to Find the Weight of a Given Box of 112 Sheets.

Multiply the number of square inches in the given sheet by the base weight. Divide the result by the number of square inches in the base sheet. Result will be weight of the given box.

Rule to Find the Weight of a Given Box of More or Less Than 112 Sheets.

Multiply the number of square inches in the given box by the base weight. Divide the result by the number of square inches in the base box. Result will be weight of the given box.

Rule to Find the Weight of a Base Box When the Weight of a Given Box of 112 Sheets is Stated.

Multiply the number of square inches in a base sheet by the given weight. Divide the result by the number of square inches in the given sheet. Result will be the base weight.

Rule to Find the Weight of a Base Box When the Weight of a Given Box of More or Less Than 112 Sheets is Stated.

Multiply the number of square inches in a base box by the given weight. Divide the result by the number of square inches in the given box. Result will be the base weight.

Quantity.

Rule to Find Number of Base Boxes in a Quantity of Given Boxes 112 Sheets Each.

Multiply the number of square inches in the given sheet by the number of boxes of the given size. Divide the result by the number of square inches in the base sheet. Result will be the number of base boxes.

Rule to Find the Number of Base Boxes in a Quantity of Given Boxes of More or Less Than 112 Sheets Each.

Multiply the number of square inches in the given box by the number of boxes of the given size. Divide the result by the number of square inches in the base box. Result will be the number of base boxes.

Rule to Find Number of Given Boxes, 112 Sheets Each, in a Quantity of Base Boxes.

Multiply the number of square inches in a base sheet by the number of base boxes. Divide the result by the number of square inches in the given sheet. Result will be the number of given boxes.

Rule to Find Number of Given Boxes of More or Less Than 112 Sheets Each in a Quantity of Base Boxes.

Multiply the number of square inches in a base box by the number of base boxes. Divide the result by the number of square inches in the given box. Result will be the number of given boxes.

SCRAP.

THE PHILLIPS TIN PLATE COMPANY, Philadelphia, Pa., are issuing notices to the trade inviting them to visit their works and inspect their various grades of tin plates, cards of admission being obtainable at their office, 918 Filbert street, Philadelphia, Pa.

THE TIN PLATE MILLS at Briton Ferry, South Wales, were all closed down last week on account of the refusal of the workmen to accept a further reduction in wages. At Morriston 800 men have been thrown out of work owing to the closing of the Dyffryn Tin Plate Works, and 600 men through the stoppage of the works at Worcester and Upper Forest. The Birchgrove and Foxhole works in that district are also idle. Those of the Beaufort Tin Plate Company are reported to be the only Morriston works running with any regularity.

THE Western Mail of Swansea, Wales, reports that a dozen tin plate workers left Liverpool for this country last week, and that a similar number were about to start in the course of a few days.

A CORRESPONDENT of the Iron and Steel Trades Journal of London, writing from Venice, Italy, says that the import of English tin plates, formerly in great demand, has fallen off very materially, owing to the starting in Lombardy and at Piombino of some large tin plate mills. The English

prices, together with the freight and import duty, are, he says, preventing all business. The cost of Italian tin plates, all charges included, at destination is about \$2.50 per box of 112 pounds, whereas the import duty on similar English tin plates is as much as \$1.75. Consequently all competition with the local product is for the present out of the question. Thus another country is becoming self-supporting in the matter of tin plates. It was noted a short time ago that the tin plates made in Spain were ousting the British product from the markets of that country.

THE SCOTTDALIE IRON & STEEL COMPANY, Limited, Scottdalie, Pa., manufacturers of fine iron and steel sheets, added one cold mill to their plant last summer and a second last month, and are now at work on a third. All these mills have been built by the A. Garrison Foundry Company of Pittsburgh. The one now under construction is expected to be in operation not later than April 15 next. These mills are turning out a high grade of finished sheet. The six hot mills of this concern are in full operation, and also their muck and bar mills. This firm roll all their own sheet bars, the sheet mills using the entire output of the bar mill.

SOME of the Welsh tin plate workers have taken service abroad are showing practical sympathy with their distressed brethren in Wales by forwarding subscriptions to the relief fund maintained at home. Those at the new tin plate works at Bilbao, Spain, send regular monthly remittances for this purpose.

THE BRITISH BOARD OF TRADE returns for March show that the total exports of tin andterne plates from British ports during the month amounted to 30,000 tons, as against 25,000 tons in March, 1894, and 33,000 tons last February. Of this amount 18,000 tons were sent to the United States, as compared with 23,000 tons in February last and 16,000 tons in March, 1894.

IT IS ANNOUNCED that a company has been formed in England with a capital of \$180,000 to carry on the manufacture of tin plates in Hungary. Among the promoters are several well known names in the Welsh tin plate trade. Labor is cheap in Hungary, and the trade in tin plates in the Danube region is considerable. Consequently the venture promises to be remunerative. The proposed establishment of fresh competition abroad by their own countrymen has aroused an indignant feeling among the Welshmen. The Industrial World, the organ of the Welsh Tin Platers' Union, bitterly comments on the manner in which a number of their manufacturers are promoting the manufacture of tin plates in foreign countries hitherto supplied by Wales and so helping to kill their home industry.

SOME CORRESPONDENCE has been going on lately in the British trade papers in regard to a suggestion made by one of the largest tea merchants in England that tin plates might be used with ad-

vantage for packing tea. The balance of opinion seems to be, however, that tin would be too expensive for this purpose. Chests made of lead coated plates are cheaper, and there is always a ready sale for the old chests of this description. These are sent to works where the lead is remelted and run into bars again, whereas old tin chests could not be so readily utilized. Heretofore, as is well known, tea has been packed in wooden chests lined with lead, but the timber for this purpose is said to be becoming scarce. Tea growers are therefore casting about for some substitute, and the question seems to lie between leaded or tinned plates for the boxes. In regard to the growing scarcity of timber, a correspondent writes to the London *Ironmonger*, stating that in the tea growing districts of India 12 or 14 years ago the planters had only to go about 10 or 15 miles for the timber to make the chests. Now it is becoming so scarce that they have to go up country for 150 or 200 miles for their supplies. The need, therefore, of other material is growing urgent.

THE WORKS OF THE Foxhole Tin Plate Company, Llanmallet, South Wales, were restarted this week.

THE AMERICAN TIN PLATE COMPANY, Elwood, Ind., have just completed arrangements for building an addition of five mills and eight tinning stacks.

THE EFFECT of the lately increased use of American tin plates is seen in the Treasury returns of imports for February, which show that only \$785,397 worth of foreign plates were entered for consumption during the month, as compared with \$1,007,366 worth in February last year, notwithstanding the fact that the general consumption of tin plates was, if anything, larger than a year ago, and also that a reduction in the duty on foreign plates has taken place in the interval.

THE ELLWOOD TIN PLATE COMPANY, Ellwood City, Pa., has begun work on a new pickling room 40 x 60 feet in size.

THE NEW TIN PLATE COMPANY, recently referred to as about to establish a third tin plate plant at Elwood, Ind., will, it is announced, begin its erection at once. The works will employ about 300 men.

The Situation in Wales.

A member of a prominent tin plate importing house in New York City, who has recently returned from a trip to England, in speaking of the condition of the tin plate trade in that country, as he found it, said that he was somewhat surprised to find that the trade did not appear to be by any means in as desperate a condition as it is generally pictured. In Liverpool the tin plate brokers were very busy, and the feeling seemed to be quite hopeful. It is hardly realized on this side that the United States is not the only market for British tin plates. They are shipping considerable quantities of plates to Australia, South Africa, Russia, Argentina and many other quarters and these markets are growing. Moreover, the home demand in Great Britain—a factor which is generally left out of account—calls for quite a large volume of plates. Together with the shipments still being sent to this country, a very considerable trade is thus left in the hands of the British manufacturers yet, and they are pushing it for all it is worth. There will be enough

work for about all the mills now in operation in South Wales. It is probable, however, that those which have closed down will not restart for a long time, if ever. A number of mills whose location at a distance from shipping points renders them at a disadvantage in regard to others more favorably placed will probably have to go out of business altogether, but the others are likely to go on indefinitely. The distress among tin plate workers, although sufficiently acute in a few districts, is neither as serious nor as widespread as would be supposed. The wage question is, apparently, the only obstacle to the continuation of a fair business in the Welsh trade throughout this year. The more distant future is not so clear.

THE WASHINGTON TIN PLATE COMPANY have been organized and will erect a tin plate plant at Washington, Pa. The new concern are composed of Wm. H. Griffiths, formerly of Cadwalader & Griffiths, and a number of capitalists. Plans are being prepared for a tin mill which will consist of a main building 100 x 175 feet, to be used as a rolling mill, an annealing and pickling department 60 x 70 feet, and tinning house 50 x 100 feet. The rolling mill building will be built of iron, while the remainder of the plant will be constructed of brick. Jackson & Evans of Pittsburgh are the designers and engineers, and will receive bids for the construction and entire equipment of the plant.

Gasoline Melting Furnace.

The accompanying illustration shows a melting furnace manufactured by the Union Heater Supply Company, De-

Gasoline Melting Furnace.

troit, Mich., intended for melting metals in small quantities. It is stated that it will melt brass in 20 minutes and other metals accordingly. The fuel used is gasoline which is stored in an air tight tank, shown at the right, and is forced to the burner by pressure by means of a small pump. The burners are mounted on double swivels which enable the user to withdraw the flames without putting them out while changing crucibles. These furnaces are used for all small work, and are especially adapted for pattern makers, being likewise employed, however, by assayers, jewelers, dentists and others.

Acting Secretary of the Treasury Hamlin, in accordance with the joint resolution adopted by Congress as to importing goods into the free zone of Mexico, has instructed customs officers that the privileges heretofore accorded in the transportation of merchandise without examination from the desig-

nated ports in the United States, as contained in Articles 442 to 453, inclusive, of the Customs Regulations of 1892, are suspended until otherwise directed, so far as they relate to goods consigned to places within the so-called free zone of Mexico. Goods destined for places in Mexico beyond the limits of said free zone may be forwarded, as heretofore, under the regulations cited. Merchandise consigned to places within the limits of the free zone must be entered and appraised at the port of original importation and may be forwarded under warehouse and transportation entry to ports on the frontier, where entry for exportation may be made in the usual manner.

Fire Losses in the Indiana Gas Belt.

Figures, compiled by one of the largest insurance agency companies operating in the Indiana gas belt, exhibit a very remarkable degree of growth in fire losses in that section within the last three or four years. The company in question have been doing business in Indiana for nearly 20 years, and their representatives have spent much time and pains in collecting statistics to explain the reason for this phenomenal growth in losses. It appears that for many years prior to December 31, 1891, the losses to the fire insurance companies in the Indiana gas belt were less than 44 per cent., while since that time they have more than doubled, and now exceed 89 per cent. The conclusion reached by the investigating company is that carelessness in the use of natural gas has been responsible for a large majority of the fires. The primitive methods of controlling the gas pressure in that region seem to be something extraordinary, it being estimated that,

in order to take advantage of cheap fuel, property owners sometimes connect the gas mains with flues built only for slow wood or coal fires. During the busy hours of the day the pressure would be turned on full force, and through carelessness at night, when the pressure would be heavy, its due regulation would not receive proper attention. The consequence of these conditions is that fire insurance rates in the Indiana gas belt have been raised to such a level as to prevent a great number of property owners and others from taking up insurance at all.

The announcement is made that the directors of the Edison Electric Illuminating Company of New York have decided to authorize the issue of \$15,000,000 one hundred-year 5 per cent. gold consolidated mortgage bonds, in order to extend the business of the company in the upper part of New York City.

ROOFING AND CORNICE.

Cornice Makers' Squaring Shear.

We show in the accompanying illustration a general view of an 8-foot squaring shear, known as No. 0, made

ends and bolted to the rear side of the legs directly behind the knife bar, making the entire machine and knife rigid. This is a particular advantage when the blades become slightly dulled, as the center bearing blocks are adjusted

Cornice Makers' Squaring Shear.

by Bertsch & Co., Cambridge City, Ind. The special features to which the manufacturers allude are their self balanced treadle with patent truss rod, patent quick opening, self locking hold down, patent shearing table adjustment and locking device and patent knife bar bearings. The treadle has an extensive counter weight on the rear side, which slightly overbalances and becomes an element in lifting the knife bar, which will require lighter springs, making it easier to operate. The arms that support the foot board are wrought iron and, with the patent truss rod, make the treadle light, strong and rigid. The spring supports are wrought iron and adjustable to suit the operator. The hold down is quick operating anywhere in front by the gas pipe handle. It is self-locking when down and self supporting when up, and it is especially mentioned that it is not in the way in either position. The blades can be seen at either end, and the shearing line at different places along the hold down, as there are half round openings along the lower edge for the purpose. The shearing table adjustment is composed of the usual set screw, which pushes the table toward the top blade, and a bolt that draws the table away from the top blade, permitting an easy adjustment of the shearing table forward or backward without hammering. When both are tightened a complete lock is formed, holding all parts rigid. The patent knife bar bearings are composed of two extra wedge shaped adjustable center bearing blocks that are planed and fitted to a heavy angle shaped cross tie, which is also planed and is fitted at the

downward, if required, by a temper screw to make the knife bar rigid in the center for heavy work, and in case the

A Sheet Metal Ceiling.

blades are dull and require closer adjustment in the center.

THE SLATE OPERATORS of the Bangor district in Pennsylvania are reported to be in the full tide of a good spring business. Reports recently obtained from the Bangor, Pen Argyl and

Wind Gap quarries show that more men are at present at work than at any time since the quarries were opened.

A Sheet Metal Ceiling.

We show in the accompanying illustration an example of the handsome ceilings manufactured by the Wheeling Corrugating Company, Wheeling, W. Va. The manufacturers allude to the many advantages of metal ceilings, they being water proof, fire proof to a large degree, and neither warping, shrinking nor cracking. The present forms of highly decorated ceilings are altogether different from the original corrugated sheets, from an artistic standpoint, the raised designs giving beautiful effects, as, for example, in the illustration presented. It is also said that metal ceilings are particularly valuable in churches, court rooms and theaters, on account of their acoustic properties, besides being non-absorbent and therefore of special use in stores, hospitals and other buildings where there are strict sanitary requirements. The Wheeling Corrugating Company have branch offices at 81 Fulton street, New York; 474 Laflin street, Chicago and Twelfth and Poplar streets, St. Louis.

FLASHINGS.

L. D. BERGER, 59 North Second street, Philadelphia, Pa., is distributing his 1895 illustrated catalogue and price-list of the extensive line of tinners' and roofers' supplies which he

manufactures. The pamphlet of over 90 pages is very profusely illustrated and shows an extended line of goods of interest to the trade. The first pages relate to tinners' trimmings; then come stove bolts, pipe hooks, hangers, conductor pipes, gutters, ridging, creatings, finials, conductor heads, tin shingles,

registers, stove shovels, furnace pipes, roofing, skylights, roofing tools, tinners' tools, &c. The above list chosen at random, indicates the range of work, many other articles being shown, however, besides those mentioned.

THE KNEISLEY & YELDHAM COMPANY, 68 to 74 West Monroe street, Chicago, are to furnish the galvanized iron cornice and bay windows for the residence of I. Solomon, 553 Grand avenue.

S. KEIGHLEY & Co., Pittsburgh, have just finished a very important job of ornamental galvanized iron work at Oakland, Cal., including the covering of the entire exterior of the large Casino Building now being erected in that place. The building is 300 feet long and 109 feet wide.

JAMES E. KELLY, New Haven, Conn., has taken the contract for the roof of the new power house of the Norwalk Tramway Company and also some work for the Norwalk Lock Company, whose work he has done for the last 28 years. Another big contract recently taken by Mr. Kelly is on the new building of P. & F. Corbin, at New Britain.

WE ARE IN RECEIPT of a photograph from A. L. Burtis, Lockport, N. Y., showing the front of his store. An awning over the front shows the word "Furnaces," and over the door his name appears on a neat sign, suspended from which is a large ball, which we presume is made of sheet metal, and made, too, in his shop. Both of the plate glass show windows are arranged with a display of elbows of different sizes and angles. On the sidewalk in front of the windows the photograph shows Mr. Burtis and one of his corps of assistants.

A CERTIFICATE OF INCORPORATION of the Troy Sheet Metal Company, Troy, N. Y., has been filed with the Secretary of State. The capital is \$10,000 and the directors are: Jesse D. Ennis and Robert J. Wylie of Troy and Frank H. Knox of Lansingburgh. The organization will succeed to the business of the White & Ennis Cornice & Roofing Company.

D. B. HILTON, sheet metal construction, skylights, &c., issues a notice to the trade under date of April 9 that, owing to the destruction by fire of his former factory, he has taken larger and more spacious quarters at 254-256 State street, between Boerum place and Smith street, Brooklyn, N. Y.

President A. B. Stickney of the Chicago Great Western Railroad has long been an advocate of the migration of working people from the cities to farms in order to relieve the congested condition of the great centers of population. He has now perfected plans for carrying out his own suggestion on lands which he has acquired near Stanton, Minn., on the line of the Great Western Railroad, about 36 miles below St. Paul. These lands will be divided into small holdings suitable for raising produce, and will be leased at low rates to married men with families from cities, who are willing to settle on them, the sole requirement being that they must keep the land in cultivation.

Edward Reis, manager of the Rosena Furnace, New Castle, Pa., has invented a pair of "explosion doors," meant to prevent the disastrous results which have followed the recent slips at that furnace. The new invention has been placed on the Rosena.

Trade Notes.

F. W. GREGORY & Co., 160 High street, Boston, Mass., have put on the market what they call the Boston Flux or Metal Purifier, which they claim cleanses and strengthens the iron and eliminates the carbon, phosphorus and sulphur. It is said to render the iron fluid and permits the use of a poorer grade with a large percentage of scrap.

THE ROOFING TRADE will be interested in the announcement made in our advertising columns by William F. Harvey, 701 Girard Building, Philadelphia, Pa., relating to the Amice brand of palm oil Process Plates.

THE IDEAL COMPANY, 36 Dearborn street, Chicago, Ill., manufacture a sewing machine which may be retailed at five dollars.

IN THEIR ADVERTISEMENT elsewhere in this issue the Oliver Wire Company, Pittsburgh, Pa., announce that they are prepared to furnish annealed, bright and galvanized Steel Wire, straightened and cut to any lengths, not exceeding 16 feet, for the manufacture of Brazier Rods, Stove Bolts, Oven Racks and other specialties and for tinners' use generally. The trade are requested to submit specifications and obtain prices on the above goods.

FRANK P. BOLAND of Providence has recently invented and patented an extinguisher for kerosene lamps and oil stoves, and a company for manufacturing it has been formed under the laws of the State of Maine, with a capital stock of \$500,000, and Alfred J. Hodder of Boston, as president, and Charles H. Kittredge as treasurer. The company are known as the American Burner Company.

JAMES A. MILLER & BROTHER, 129-131 South Clinton street, Chicago, Ill., owing to changes in their plant which compel them to move on May 1, will make special prices on their stock of Corrugated Iron which they have on hand and can be shipped before April 30.

THE WARREN FOUNDRY COMPANY, Warren, R. I., who formerly manufactured Stoves, have been sold out to other parties, and will be known in future as the Warren Foundry & Machine Company. The buildings have been enlarged and traveling cranes and other improvements have been added. The new company intend manufacturing high grade Machinery Castings, and the foundry will also be equipped with modern arrangements for the manufacture of Brass Castings of all descriptions.

THE NEW YORK ELECTRIC MOTOR & VENTILATOR COMPANY of New York City have been chartered at Albany with a capital of \$30,000. The directors of the new concern are Sidney Green of New York City and C. A. Sherman and Lincoln Vancott of Brooklyn.

IN THEIR ADVERTISEMENT elsewhere in this issue the Beaver Tin Plate Company, Lisbon, Ohio, announce that their plant is now in successful operation, and they are prepared to quote prices on Tin and Tinned Plates, which they guarantee equal to any in the market, and solicit inquiries of the trade.

A STRIKE for higher wages occurred last week among the tin workers at the factory of the Lalance & Grosjean Mfg. Company, at Woodhaven, L. I., about 100 men being involved. This is notable as being the first strike which has occurred at these works since the

company commenced operations, 30 odd years ago. It has been a short lived one, the men having re-applied for work this week. As the company had no pressing need for operatives in their Tinware department at the time, it was shut down, and only re-opened on Thursday, when some 30 or 40 of the men were taken back at the old scale of wages, which is said to be a little higher than that generally paid. None of the other departments of the works were affected, although a strong effort was made to incite a sympathetic strike. Lalance & Grosjean have the reputation of being very just and generous employers. During the hard times of last year the company kept their factory running almost continuously, solely in order to provide work for their people, and are said to have never allowed any of those dependent on them to suffer want. The recent strike was, therefore, heard of with some surprise.

P. H. KEEVAN of Kenosha, Wis., a manufacturer of Brass Goods, will locate in Lorain, Ohio. The site which has been offered him was formerly occupied by the Young Mfg. Company, besides which the necessary boiler and engines will be given to him. The new plant will employ steadily about 50 men.

THE NIAGARA FALLS METAL SIGN COMPANY have been incorporated with a capital stock of \$20,000 for the manufacture of Ornamental Signs, Figures, &c.

THE STEWART ENAMEL COMPANY are erecting a plant at Bellaire, Ohio, for the manufacture of Enameled Iron Sign Plates, Kettles and other specialties in Enameled Ware. The plant is expected to be ready for operation in May. This will be the only works of this kind in the United States.

AVRAULT BROTHERS & Co., manufacturers of Wyckoff Water Pipes, at Tonawanda, N. Y., have resumed operations again after having made a number of extensive improvements during the past winter.

THE GIRARD STOVE & FOUNDRY COMPANY, Youngstown, Ohio, have been very busy in their roll foundry, and have been running their machine shop night and day for some time. They have enough orders ahead to insure steady operations for some time to come. This concern report that they are in the market for a second hand roll 18th 30-inch swing, 12 foot bed, and a belt or steam power traveling crane, 25 tons capacity and 50-foot span.

LALANCE & GROSJEAN MFG. COMPANY, 19 Cliff street, New York, have just made a large shipment of Enameled Ware to Glasgow, Scotland, and another to Cristiania, Norway, in response to orders. The firm have also recently filled considerable orders for this ware from Australia and South America, with which countries they are doing a growing trade. In Brazil and the East coast of South America, in particular, they find an increasing demand for Enameled Household Utensils and Tinware.

A special meeting of the stockholders of the Union Storage Company of Pittsburgh was held last week, and the capital stock was increased from \$500,000 to \$750,000. Improved machinery and a better equipment for all kinds of storage will be placed in the present building, and a bond house, 20 x 120 feet, for Government export and import bonded goods, will be erected.

PLUMBING and GAS FITTING.

The Sanitas Crown Closet.

The Sanitas Crown closet, which is shown in our illustration, has just been brought out by the Smith & Anthony Company, 54 Union street, Boston, Mass., and is a worthy addition to the

noiseless. Another special feature of the closet is its sanitary seat. This seat fastens to the crockery by nickel plated arms, keeping the wood work well above the crockery, so that it cannot become foul in any way. The bowl and trap are combined, the

couplings and slip joints. All the wood work used is of high quality and finish. The Crown is the lowest priced of the Sanitas series, and is described as a remarkably fine finished article for the price. The Sanitas goods are carried in their New York store at 56 Beekman street and also by the Albene Stone Company, 217 Lake street, Chicago.

The Sanitas Crown Closet.

Sanitas series of closets, lavatories and traps. The Sanitas closets are all constructed on the jet principle, with the additional feature of a retarding chamber to hold the supply of water in the bowl. This is a patented feature of the Sanitas closets. The retarding chamber also acts as a deafener and makes the Sanitas Crown closet practically

surface of standing water being very large and at the most desirable distance from the seat. The water is very deep back of the closet, and is deepest at the point where the wastes strike. If a special vent is desired an unusually large one is provided with every Sanitas closet. Freedom from breakage is secured by using the Sanitas flexible

The Little Wonder Gas Bath Heater.

The accompanying illustration shows a gas bath heater put on the market by McCoshn & Co., 8 North Central avenue, Baltimore, Md. It is intended to

The Little Wonder Gas Bath Heater.

heat water by gas jets with a capacity of 10 gallons in from 15 to 30 minutes. The heater is nickel plated copper, and while it is simply strong enough to hold the water to be heated it is not intended to stand reservoir pressure. Three feet of rubber hose is furnished with each heater for connecting to the cold spigot, as shown in the illustration. The firm likewise make an all galvanized iron heater in the same style.

The Best Way to Calk Joints.

From JUNIOR PLUMBER, Newark, N. J.—I would like to learn from the readers of *The Metal Worker* the best way to calk joints in soil pipe so that they will stand the water test.

Note.—We know that our readers differ in their practice of making these joints, and we hope that they will describe their methods of making them, with their reasons. It is generally considered that care must be taken to get the spigot end of the pipe so located in the hub that the space will be equal all around the pipe. Then good even oskum is picked so that it is free from

lumps, and a rope about an inch in diameter and long enough to go around the pipe is rolled up and carefully

against the pipe and also against the hub. A good soft lead should be used, so that when it is spread in calking it

The Universal Bath Heater.—Fig. 1.—General View.

pushed down to the bottom of the joint and then calked so that it is both air and water tight. Sometimes a second layer is used, care being taken to get the joint in the second rope of oakum away

will fill the pores and uneven places in the pipe without excessive hammering, which is liable to split the hub. Ordinarily this lead packing will fill a space about $\frac{1}{4}$ inch deep. Some plumbers put

Fig. 2.—Sectional View.

from the joint that was made in the first rope. The oakum should not occupy a space more than $\frac{1}{2}$ inch deep at the bottom of the hub. The joint is then poured full of hot lead so that it will bulge up slightly in cooling. It is then

this lead packing in in two layers, calking each layer carefully after it has been poured.

THE STEEL CLAD BATH COMPANY,
W. C. Trageser, president, 447 West

Fig. 3.—Plan View.

calked so as to bring the raised portion of the lead down level with the top of the hub end of the pipe, care being taken to make the lead fit tightly

Twenty-sixth street, New York City, announce that they are now the exclusive owners of the United States Patent 458,995, issued to George Booth for bathtubs and the registered trade-

mark United States 21,806, for the words "Steel Clad," also issued to Mr. Booth. They say that they have been advised that the patent and trade-mark are in every respect original and valid, and that they will deal according to law with all infringers and concerns selling infringing tubs.

The Universal Bath Heater.

The Illinois Safety Heater Company, St. Charles, Ill., are putting on the market an apparatus for heating water for the bathroom. It can be operated by gas from the city supply or by gas made by their gas manufacturing apparatus. Fig. 1 shows a general view of the apparatus, and Fig. 2 shows a sectional view of the waterway and burner. The burner sets directly under the water heater, the products of combustion rising at each end and passing out through the smoke outlet at the top of the heater, shown in Fig. 1. Fig. 3 shows the circuitous course which the water is made to take in passing through the heater, the water entering at one corner and passing between the partitions, as shown, until it reaches the outlet on the opposite side. It is claimed that the water that flows is equal to a $\frac{1}{4}$ inch stream and the temperature to which it is heated depends upon the quantity of gas burnt. It is said, however, that sufficient water for a bath may be heated to the desired temperature in a very few minutes.

Kitchen Boiler Explosions.

A great deal of attention has been given by the English trade press to the subject of kitchen boiler explosions, and more or less of what has been said has been repeated in the American press, though it is almost entirely inapplicable. From the diagrams used in connection with these articles and the descriptions given it can readily be seen that the method of piping is quite different from that in most general use in this country. The words "kitchen boiler," as used in England, apply to what is known as a water back here, and the explosion of a water back in the United States is generally due to carelessness or ignorance. Such an accident is most frequently heard of in connection with houses that have been closed for a season, and, as a consequence, the water supply has been shut off and the plumbing system drained. Oftentimes a fire is built in the range or cooking apparatus previous to turning on the water, and if when the heating coil or water back has reached a temperature approaching redness the water is turned on, steam will be generated instantly of sufficient power to burst the water back. These accidents generally occur at a season of the year when frost is in no way accountable for them, while the explosions described in England are directly due to some of the pipe becoming frozen, more particularly the pipes leading into the water heating apparatus, which they call the boiler. It would seem from reading the accounts of the explosions there that their kitchens are not kept as warm as the American kitchens, and that the freezing of the pipes to their water heating device is by no means uncommon. With the water at a low temperature and their water heater full, if their pipes become frozen there is no room for the water to expand on heating. The heater will therefore be sorely strained, if not fractured. If fractured, be the leak ever so small, the

water contained will soon be exhausted; then when a new fire is built before the frozen pipes are thawed out the water heater becomes so hot that on the pipes being thawed an inrush of water causes the generation of steam, which wrecks the apparatus, as the leak will not permit the steam to pass off with sufficient rapidity.

Hodgdon's Brass Pipe Hanger

We show in the accompanying illustration a hanger for brass pipe, put on the market by C. W. Hodgdon, 164 High street, Boston, Mass. It is made to be neat, strong, and attractive in appearance and is intended to support brass pipe from the wall or ceiling.

Hodgdon's Brass Pipe Hanger.

The device is complete in itself, requiring no screw or other means of fastening, as the screw shank is long enough to reach either studding or beams. The rings are made of polished brass, of all sizes, so that different sizes of pipe may be supported by one hanger. With the increasing use of exposed work and brass pipe there has arisen a demand for a neat and serviceable hanger, and it was with a view of supplying such a hanger that the present device was brought out.

The Delaware Plug Basin.

The accompanying picture shows the Delaware plug basin, manufactured by J. J. Wade & Son, 276 Dearborn street,

The Delaware Plug Basin.

Chicago, Ill. One of the special features of this basin is the provision for thoroughly flushing the overflow and trap. It differs from the ordinary plug basin by having a secret overflow of glazed earthenware, made as a part of the basin. A part of its fittings is a sanitary soap cup which drains into the overflow, so that the water and waste soap from the cup, instead of accumulating as is ordinarily the case, is dis-

charged to the waste pipe. On removing the strainer in the soap cup a swab may be inserted for cleansing the interior of the overflow. A flushing jet is attached to the overflow by which both the overflow and trap may be flushed at will. The ease with which the basin may be cleaned is a property for which great excellence is claimed by the manufacturers. It is stated that any of the commercial traps on the market may be used in connection with the basin.

Graduated Plumbers.

Graduating exercises of the North End Union Plumbing School were held at the school on Parmenter street,

Boston, Mass., Wednesday night. Work of the students was placed on exhibition previous to the exercises. Addresses were made by David Smith, President of the Master Plumbers' Association; William H. Sayward, Secretary of the National Association of Builders; Rev. John Cuckson, Thomas J. Tute and John Cooper. The speakers encouraged the students and recommended manual training schools as the best method of training young men for mechanical accomplishments. At the

close of the exercises the Committee on Examination reviewed the work of the students and awarded diplomas to Edward H. Marshall of Somerville and Walter B. Chase of Boston. Samuel F. Hubbard, Superintendent of the school, presided. The third term will open on October 1, 1895.

In connection with the use of cellulose in war ships, Alfred J. Ostheimer,

president of the Cellulose Company, Philadelphia, has received a cable dispatch stating that in the battle of Yalu the Japanese battle ship "Matusima" was pierced by a 6-inch shot, but the ship suffered but slight damage, the cellulose in her coffer dams having quickly expanded and closed the breach. This is the first time that cellulose has been tested in actual warfare.

TRAPS AND VENTS.

WM. I. MAUDE has started as a plumber, tinner and copper worker at 204 Pleasant street, Fall River, Mass.

BLANCHARD & BRADEN, Oldtown, Me., successors to Daniel Sawyer, have taken possession of the business and started in at the old stand. They will do plumbing, steam and hot water heating, tin and iron roofing, &c.

PETER HOWARD and THOS O'CONNELL have been registered proprietors, of Howard & O'Connell, plumbers Montreal, Can.

MR. WRIGHT of Bennett & Wright, plumbers, &c., Toronto, is on a week's business trip to the United States in search of the newest things in all lines pertaining to his business.

JOSEPH DESLAURIERS and JOSEPH DEMERS have been registered proprietors of Joseph Deslauriers & Co., plumbers, St. Henri De Montreal, Quebec.

J. W. VILLINGER & BRO., plumbers, will remove from Third and West streets to West Fourth street, near Pine, Williamsport, Pa.

THE WILCOTT-HURLEUT COMPANY, 175 and 177 Lake street, Chicago, are furnishing their customers with handsome cloth covered portfolios in which to preserve the company's catalogues of plumbing specialties. These catalogues are being issued in series. The one just out is a very handsome publication devoted to bathtubs. It is beautifully printed and finely illustrated on heavy paper. Improvements are shown in a number of types of bathtubs. The goods illustrated are light gray enameled iron porcelain lined, patent overflow porcelain lined, shallow porcelain lined, the Puro porcelain lined recessed, the Princess porcelain lined flat rim, the Duchess porcelain lined roll rim, the Aden shallow porcelain lined, the Czarina shallow porcelain lined, the Persian pool bath, set and foot baths, &c.

THE following plumbers have recently started shops in Chicago: F. R. Scholfield, 310 South California avenue; Albert Peterson, Milwaukee avenue and Centre street; Henry & Clark, 5738 Wabash avenue.

A REPRESENTATIVE in the Michigan Legislature thought that the Plumbing bill meant that if a farmer wanted to run a pipe from a windmill to a watering trough he would have to hire a licensed plumber.

WALTER CALHOUN has purchased the interest of the late Edward P. Williams in the plumbing business formerly conducted by Calhoun & Williams, at Amsterdam, N. Y., and will hereafter be the sole owner.

INSTANTANEOUS WATER HEATING COMPANY of Chicago have increased their capital stock to \$60,000.

A. B. WILKINSON, the plumber, is now located in his new shop in the rear of the Knox-All printing office, West Haven, Conn.

F. H. ROATH, who recently opened the store 76 and 78 Water street, Norwich, Conn., as a plumbing establishment, will handle the Hub steam heater.

It is said the plumbers of Detroit, Mich., do not take kindly to the recommendation of the Board of Health for a plumbing inspector, and when the matter comes up in the council it will have considerable opposition.

A. C. HOVEY, who for fifteen years has conducted a stove store in Smyth's Block, Manchester, N.H., has entered into partnership with W. L. Spaulding, formerly with the Pike & Heald Company, and the new firm will continue business at the old stand. Mr. Spaulding is a practical plumber and steam and hot water engineer.

The House of Assembly of New York have passed a bill giving the Department of Public Buildings in New York joint jurisdiction with the Board of Health over plumbers and plumbing.

CHARLES VANDERCOOK has been appointed inspector of plumbing for the city of Cohoes, N. Y., at a salary of \$800 per year.

A. G. MILLER of Lancaster, Ohio, has leased the J. G. Lullier room in the Centennial Block, Marion, Ohio, where he will establish a plumbing shop at the old stand of Cunningham & Stowe.

PUMPHREY & ARMSTRONG have purchased the stock of T. S. Clark, the well-known plumber, of Delaware, Ohio.

THOMAS CONLIN PLUMBING & HEATING COMPANY have been incorporated at Chicago. The incorporators are Thomas Conlin, William B. Elwell and John Moss.

The inmates of the county prison at Kansas City, Mo., are to construct a sewer for the prison.

The front of Ed. Bailey's plumbing shop, at Altoona, Pa., was scorched by fire last week.

JOHN MITCHELL, president of the National Association of Master Plumbers, visited Newark, N. J., this week, conferring with the Master Plumbers' Association in reference to putting the Baltimore resolutions into full operation in that city.

THE ADDRESS of DuBois & Darrow, formerly in the plumbing supply business in New York, is junction of Old River Road and Second River, Newark, N. J., where they are engaged in the manufacture of specialties.

THE H. MUELLER PLUMBING AND HEATING COMPANY, Decatur, Ill., have been awarded the plumbing in the new Millikin block. The contract amounts to about \$13,000.

P. J. CASEY of Newport, N. H., has been at Ludlow, Vt., looking over the field with a view to establishing himself in the plumbing business. He expects to rent the new building which is being erected.

THE PLUMBERS of Hampshire County, Massachusetts, have for some time been trying to bring all of the master plumbers of the towns of Northampton, Easthampton, Florence, Haydenville and Amherst into an association with a uniform list of prices for plumbers' supplies, from which no deviation was to be made in bidding for contracts, and builders of houses have for some time been obliged to pay the prices the plumbers have agreed upon. The asso-

ciation has labored hard to make the organization complete, and all of the master plumbers in this section of Hampshire County are in the combine except one master plumber in Amherst, who refuses to join.

V. E. LOMBARD, the plumber, has bought out E. M. Leland and has established his business at the old stand on Railroad street, Great Barrington, Mass., and is prepared to do all kinds of work in sheet iron and tin, as well as sanitary plumbing.

THE OFFICES of A. D. Burns' plumbing establishment, Bradford, Pa., have been moved into the Burns block.

BENJ. GUINEY of the Detroit Builders' Exchange, Colonel McGurrin of Grand Rapids, Captain John Wheeler of Kalamazoo and others have visited Lansing, Mich., and done a great deal to aid the plumbing bill which is being pushed by Representative John Donovan.

No. 4 Fire Pot.

The Clayton & Lambert Mfg. Company, Ypsilanti, Mich., are putting on the market the No. 4 fire pot with air

No. 4 Fire Pot.

pump and pressure gauge, a general view of which is shown in accompanying illustration. They explain that while their No. 1 fire pot meets all the requirements of general plumbing and tin-smithing, yet there are some lines of work for which more heat and more space for irons and metal are necessary. For this they are making two, three and four burner fire pots. The four burner pot will melt 200 pounds of lead in 20 minutes, and will, it is claimed, heat all the irons that six or eight men can use. It is used in large factories for lining lead tanks and other work requiring a large amount of heat. The Clayton & Lambert Mfg. Company advise us that they are in position to build fire pots suitable for special purposes, if the trade will send them specifications of what they need.

The report of the European agent of the Department of Agriculture at Washington indicates that the recent severe weather has caused great injury to crops in Great Britain and France, and indeed throughout the whole of Europe.

The Inter Ocean Electric Railway has been incorporated in Illinois, with a capital of \$200,000,000, to construct an elevated electric railway from Chicago to New York and finally to the Pacific Ocean.

News and Notes.

The Chicago Subway Arcade & Traction Company have been incorporated at Springfield, Ill., with a capital stock of \$15,000,000, the declared object of the company being to construct subways in Chicago and operate a line of cars with dummy engines.

An International Inventions Exhibition is being organized at Munich, Bavaria, to be held in that city from June 15 to September 15 next. The exhibition will include new inventions of all kinds relating to industry, hygiene, transportation, &c.

According to the *Times-Democrat*, of New Orleans, La., the number of factories of various kinds in that city has increased from 915 in 1880 to 3595 in 1895; while the manufactured product has grown in value from \$19,000,000 in 1880 to over \$70,000,000 in 1895. The number of hands employed has also increased, in the interval, from 8404 to 46,000.

The ironclad cruiser "Imperator Carlo Quinto," the latest addition to the Spanish navy, was launched at Cadiz on March 13. The new vessel is expected to attain a speed of 20 knots. Her armament will comprise two 11 inch guns, ten 5½-inch guns, four 4-inch and four 6 pounder quick firing guns, four machine guns, and six torpedo tubes.

The announcement is made from Pittsburg that efforts have been undertaken to bring about an interstate conference between the local coal operators and miners of Pennsylvania, Ohio, Indiana and Illinois in order to establish uniform rates.

An agreement was signed Saturday by the companies interested in the lake and rail business between the Northwest and the seaboard for a division of traffic among the several interests. The arrangement applies more particularly to package freight, the grain business being already provided for under another agreement. The lake and rail rates will be the same as last season.

The Dutch Parliament has agreed to a vote for the purchase of 52,000 of the new 6.5 mm. Mannlicher rifles where-with to equip the Dutch army. The weapons will have to be obtained from some foreign firm, there being no facilities in the Netherlands for turning out these arms.

An unusually large number of enterprises were started in the State of Pennsylvania during the month of March. According to the first quarterly report of the Secretary of the Commonwealth, 71 charters were issued in the month of March, three being for railroads and the balance for manufacturing concerns, and 103 foreign corporations were accorded permission to operate in the State.

A combination of all the leading plate glass manufacturers of the United States was consummated at Pittsburgh last week, when several important firms were consolidated into the Pittsburgh Plate Glass Company, with a capital of \$10,000,000. The business of all the companies will be transacted in Pittsburgh, where the main offices will be located.

Navigation on Lake Erie opened on April 4, when the steamer "City of Detroit" left her dock at Detroit and made the first trip of the season to Cleveland.

THE RETAIL STORE.

The Magic Dish Drainer.

A very useful novelty for kitchen use is herewith illustrated—namely, the Magic dish drainer, which is manufactured by the Leach Roaster & Baker Company of Paxton, Ill. The article is made of perforated sheet metal and is intended to be placed in the sink. After the dishes are washed they are put in the drainer, hot water is then poured

the can opener. The goods are packed in hinged cover boxes, $\frac{1}{2}$ gross in each box.

The Shirk Refrigerator.

The Shirk Refrigerator Company, Chicago, Ill., have recently added to their line of refrigerators a style which has two doors to the ice chamber, one at the front and the other at the top

Gate City natural stone A, through which the water filters. There is a hole running perpendicularly through the stone, closed at the top but open at the bottom, through which the water is discharged after it is filtered. There is a space of about $\frac{1}{4}$ inch between the outside of the stone and the inside of the glass barrel. In operation the filter is attached to the bib at the opening in the top, the water filling the space be-

Fig. 1.—The Magic Dish Drainer.

Fig. 2.—Dish Drainer in Use.

over them freely and in a moment's time they can be lifted from the sink ready for use again or to be put away without the trouble of wiping. The compartments save the clashing together of large and small dishes, reducing breakage very considerably. It is also referred to as a convenient receptacle for carrying dishes from the kitchen to the china closet.

Can Opener Carpet Tacks.

Grand Crossing Tack Company, Grand Crossing, Chicago, are introduc-

for the greater convenience of putting in ice, also for breaking the ice for family use. The refrigerator is made in three sizes, Nos. 41, 42 and 43. They are constructed of selected oak, cork filled throughout and are fitted with solid bronze trimmings and have automatic self-tightening locks. The company advise us that they have recently opened a store at 509 Market street, Philadelphia, with J. P. Maher as manager, who was for 16 years super intendent of the Ridgway Refrigerator Company, Philadelphia, and that they will also have a New York office at 330 Warren street.

The Gate City Drip Stone Faucet Filter.

The accompanying cut represents a faucet filter recently added to their line by the Gate City Stone Filter Company, 35 Murray street, New York. The metal portion of the filter is made

tween the stone and glass barrel, filtering through the stone, and is delivered at the outlet D. The impurities from the water are deposited on the surface of the stone, from which they are removed by brushing. A few turns of the thumb screw B permits the base to

The Gate City Drip Stone Faucet Filter.

Can Opener Carpet Tacks.

ing can opener carpet tacks, as shown herewith. It consists of a can opener with a hollow handle containing 200 silver steel carpet tacks. The can opener with tacks is designed to retail for five cents, while the manufacturers state that the can opener is worth the money irrespective of the tacks, and that the tacks are their silver steel goods, worth the money irrespective of

of brass nickel plated. Between the metallic bottom and top pieces of the filter is a glass barrel surrounding the

which the stone is attached to be taken out for that purpose. The manufacturers state that the capacity of the filter is 5 gallons or upward per hour, according to the pressure and the amount of deposit in the water; that the filter can be attached to any faucet, even where there is no thread on it, by means of their improved connection; that the glass case enables the process of filtering to be seen; that the impurities never penetrate, but lie on the sur-

face of the stone; that brushing the surface of the stone presents a fresh filtering surface to the water, and that after years of use the stone will be found internally as pure and white as when originally mined. The size of the filter is $3\frac{1}{2} \times 4$ inches and the size

Fig. 1.—The Crazy Water Whip.

of the filtering stone is $2\frac{1}{2} \times 2\frac{1}{2}$ inches. When unfiltered water is desired it is drawn from the faucet C. Turning the milled ring on to the faucet to the left allows the unfiltered water to flow and turning it to the right closes the faucet. The filter is made both with and without the faucet C. New filter blocks, with directions for replacing, can be obtained when necessary.

The Crazy Water Whip.

The lawn sprinkler herewith shown is put on the market by the Crazy Water Whip Company, Anderson, Ind. It is described as being constructed of rubber of special manufacture, of the most durable character, and as finished

Fig. 2.—Operation of the Crazy Water Whip.

with brass and nickel plated attachments. It is stated that the whip throws the water a radius of 10 feet from the sprinkler, thus describing a circle of 20 feet; that it covers every inch of the space, gently sprinkling the

lawn like rain, and that in operation it writes in every conceivable direction and appears almost animated. In Fig. 1 the whip is shown attached to the hose and placed in the hose clamp on the tripod or stand which accompanies each of the sprinklers. The tripod stands 3 feet from the ground, and is made of $\frac{1}{2}$ -inch iron rods, tastefully painted, so as to present a neat appearance. The feet of the tripod are to be pressed into the lawn. The manufacturers claim that the sprinkler is new, novel, inexpensive and ornamental; that it does not strain the hose; that it is effective and durable; that it requires no repairs, and that it is commended by hose dealers.

Eureka Clothes Horse.

The cuts shown herewith represent a clothes horse being introduced by H. Young & Co., 19 East Sixteenth street,

Fig. 1.—Eureka Clothes Horse.

New York. In Fig. 1 the horse is shown folded up for putting away, and in Fig. 2 as in use. The horse extends from the floor to the ceiling and can

Fig. 2.—Eureka Clothes Horse in Use.

be made to fit any room. It has ten dowels or arms which spread for hanging clothes on. The arms with the clothes can be raised any desired height, thus facilitating the drying process. The manufacturers remark that when the horse is folded it occupies but little space, that it proves a great convenience in wet and damp weather, and that it is suitable for hanging clothes on after they have been ironed.

Zimer Gas Lamp and Stove.

Zimer Patents Company, 71 Shoe lane, London, E. C., England, are offering a combined gas lamp and stove, as shown in the accompanying cut. The device consists of a cast iron stand with wire gauze stretched across the top. A gas stand is provided, as shown by the

Zimer Gas Lamp and Stove.

dotted lines at the base of the illustration, with a gas jet and a tube for attaching the rubber hose accompanying the stove. The inside of the stand, it is explained, forms the mixing chamber for the gas and air. As shown, the stove is designed for boiling water, cooking, frying, heating sad irons, &c. For use as a lamp the gas light stand is removed from below the heater and placed on the top. A strong green cardboard shade, supported by a wire frame, is then mounted on the stand. For use as a sealing wax jet or cigar lighter, a brass tube with a small opening in one end is attached at the other end to the gas light stand by a piece of rubber tubing. In this form it may be used for sealing packages, lighting cigars in cigar stores or restaurants, for singeing poultry and for other purposes where a small flame is desirable. The stove is provided with 6 feet of flexible gas tubing, and the point is made that the device can be moved wherever it is most convenient for use. The metal parts of the stove are finished in bronze, and each stove is packed in a wooden box with hinged cover. The manufacturers advise us that they are now fitting Argand and incandescent burners for lamp use, and that they are also improving the general appearance of the device by giving more symmetry to the outlines wherever possible.

GEORGE H. COLE & Co., 219 River street, Troy, N. Y., have issued a poster designed to be hung up in the store of the dealer. It contains a list, alphabetically arranged, of the names of stoves for which repairs can be furnished from original patterns. The list is a long one, and indicates, in addition to the names of the stoves, whether they are ranges, cooks or hesters. Messrs. Cole & Co. state that they have made arrangements with the different stove manufacturers of Troy by which they can furnish repairs of all stoves on the list at their regular prices. They have also made arrangements with two of the express companies by which repairs can be forwarded over their lines in such a way as to save time and return charges.

Galvanized Pump Curb and Tubing.

The illustrations here given represent galvanized pump curb and tubing, also a rubber bucket, put on the market by O. P. Schriber & Co., Cincinnati, Ohio. The curb, Fig. 1, is made of galvanized sheet steel, and this, with the tubing, Fig. 2, is put on the market to overcome the objection to wood curbs and tubing. The manufacturers state that the curb, in addition to being made of galvanized steel, is painted and varnished to make it durable, and that it

Fig. 1.—Galvanized Sheet Steel Pump Curb.

Fig. 3.—I X L Rubber Bucket.

Fig. 2.—Galvanized Steel Tubing.

will not rot, warp or fall to pieces. The tubing, which is made of No. 24 galvanized steel, with a reservoir at the top and a funnel at the bottom, is referred to as not making the water taste as wood tubing does, as not rusting or accumulating filth, and as anti-freezing, as the reservoir piece has a small hole in it to allow the water to run out. It is stated that the tubing may also be used on any make of wood curbs, as the stirrup on all other curbs will fit the square reservoir box on the galvanized tubing. The reservoir tubing is made in lengths of 5, 6, 7, 8, 9 and 10 feet, each piece having a half coupling on it to fit the other half on the funnel tubing, the latter being made in lengths of 6, 8 and 10 feet. Plain tubing is furnished where a greater length than 19 feet is required; this being added between the reservoir and funnel pieces. The advantages of

the pump bucket, Fig. 3, are enumerated by the manufacturers as follows: The bucket cannot be put in wrong; it is made of first quality rubber and is double, having two wearing edges, with a corresponding increase of suction power; it has a water space that allows of a water packing, which is as good as rubber, without increased friction; it is reversible and self-adjusting, as the pliability of the rubber allows it to adjust itself to any sized tubing; a reverse motion of the crank will not injure it, and the rubber cannot be stripped from the link.

Oven Thermometers.

BY I. OPEN.

A great convenience to the cook will be found in a new device that has recently put in an appearance—the oven thermometer. A neat dial in a nickel plated border occupies the center of the oven door and is connected with contracting and expanding parts on the inside which operate the hand on the dial. Whether or not they record temperature correctly they point to the same place when a certain temperature is reached, and if that temperature has proven satisfactory for any article at one time it is best not to put the food in the oven till the hand reaches that point on the dial. If the fire goes down while food is cooking and the oven cools the dial hand records it promptly and is a sufficient notice to fire up. If, on the other hand, the heat increases the dial hand gives prompt notice and the fire can be checked before the food is charred. The oven thermometer has much to recommend it and is being furnished in a number of first class stores this year. Being made of metal, it is not open to the objections made to the glass thermometer which an unsuccessful effort was made to introduce a few years ago. In cost the new thermometers are very reasonable and in adjustment very simple. It is more than probable that the stove dealer can find their sale profitable for use with stoves already in service. Some of the best teachers of cooking schools and noted domestic cooks have found their use highly beneficial, so that their introduction by the dealer in otherwise well equipped kitchens should not be found difficult.

Combined Flour Bin and Sifter.

Cook Flour Bin Company, Homer, Mich., are offering a combined flour bin and sifter, made of seasoned wood, hand carved, and finished in hard oil. At the base of the bin is a receptacle holding about 10 pounds, into which the flour is sifted from above and which is accessible through a trap door in front. Above this receptacle is a wooden roll worked by a small crank at the side of the bin, and so constructed, it is explained, as to form a force feed. The roll is placed so as not to touch the sieve beneath it, to avoid wear on the screen. It is stated that 25 pounds of flour can be run through the sieve in three minutes' time. The roll and hopper are so arranged as to prevent the weight of the flour in the bin resting on the screen. A tin scoop accompanies the bin, holding just a cup of flour, which is kept in the receptacle under the sieve. The bin is designed to hang against the wall directly over or at the side of the table where the work of the kitchen is done. The man-

ufacturers claim that the bin being made of wood will not bruise or jam in handling like tin, that it cannot rust or draw dampness by the collecting of frost, and that it keeps the flour dry, warm, loose and lively. The bin is made in sizes to contain 12, 25, 50 and 100 pounds of flour.

MEMORANDA.

"I MAKE more money out of heating stoves than most hardware merchants do," remarked a South Sixth street second hand dealer, says the *News* of St. Joseph, Mo. "The reason is that I frequently sell the same stove three or four times at a profit. See that base burner sitting over there? I sold that in the fall of 1893 for \$23, bought it back a year ago for \$9, sold it last winter for \$18 and took it in again a few days ago for \$7. It is in pretty good shape yet, and ought to realize me \$10 or \$12 next winter. A great many people sell their heating stoves in the spring because they have no place to store them or because they make up their mind to buy a new one when winter comes again. But when cold weather arrives they come back and buy the same stove again or one just like it. I have one stove here which I have sold five different times and taken back as many times. It cost me \$11 in the start and I have made \$87 out of it already."

V. CLAD & SONS, Philad-elphia, have just issued a 44 page catalogue descriptive of their line of ice cream freezers and machinery, ice cream utensils and supplies. The book is profusely illustrated and is a store of information in regard to the requirements of an ice-cream saloon. A few other goods are also shown, among them steam jacket kettles, fruit presses, milk shakes, water coolers and stands, Clad's coffee urns, portable brick ovens and French ranges.

THE FIRE that swept over Canaseraga, N. Y., on the morning of March 28, destroying property to the value of \$200,000, brought a loss of \$6000 to George A. Hawley, against which he had \$2300 insurance. Mr. Hawley writes us that he lost everything in the shape of catalogues and would be glad to have manufacturers of the goods which he handles send him catalogues, price-lists, &c.

H. SOAMES & SON have just opened a hardware store and tin shop at Lawrenceville, Ill.

BISSELL CARPET SWEEPER COMPANY, Grand Rapids, Mich., are supplying dealers with attractive printed matter, and in many ways putting them in a position to increase the sale of Sweepers. The company recommend the plan of dealers putting out a dozen Sweepers at a time on trial, with responsible customers, and for this purpose typewritten letters to ladies are provided. The plan has proved remarkably successful where tried, as shown by letters from dealers. With each dozen Sweeper, in addition to a large quantity of pamphlets and circulars, two attractive window cards are sent and a view of the company's factory.

MAINE MFG. COMPANY, Nashua, N. H., New York and Boston, issue a catalogue and price-list illustrating Maine and White Mountain Refrigerators and Ice Chests, Hardwood Folding Seetees, Folding Chairs, Window Frames, Window Screens, Folding Lsp Boards, Hardwood Flower Stands, Children's Blackboards and Children's Rocking Chairs.

STOVE TRADE NOTES.

The Local Stove Trade.

The march of improvement in the stove business goes slowly but steadily on. The local stove trade, though many dealers are still heard to complain as they have for two years past, and though salesmen hear many tales of woe on their rounds, continues on a gradual up grade, as reported in our last revision of the local trade a few weeks since. Salesmen occasionally garner "goose eggs" instead of orders, but the uniform dullness, unanimous cry of hard times and universal distress have moderated. The trepidation experienced by a salesman a year or so ago as he neared the store kept by some dealer whose financial responsibility was not first class has passed away, and he does not dwell in fear of finding closed doors or the business in the hands of strangers. Journeymen are not found idling about plumbing, tin or roofing shops awaiting assignments to work as formerly, and in the small stores in the poorer neighborhoods the care of the store is in the hands again of the dealer's wife or children while he is out at work. The musical sound of the hammer and the rattle of tin and iron are heard in the back shops where silence reigned so long before.

All this is noticeable to the drummer who is familiar with the normal business or state of activity in the different stores, and acquainted with the conditions prevalent last year and '93, but it might be hard for a new salesman to believe that any improvement had taken place, for business is still far from brisk. Collections are still too slow to anticipate anything but a crawling improvement in business, for consumers in debt will be slow to increase their indebtedness, dealers slow to give the credit and manufacturers slow to urge goods on the dealer. Hence, while the struggle is fierce and constant to effect sales and move goods, there is also a tendency—yes, a necessity—to throw out buffers to retard a great deal a probable business, to avoid future difficulty in collecting.

The business of March was an improvement over March, 1894, though bearing a less percentage of gain than January and February, but winter lingered in the lap of spring and navigation was late in opening and buildings delayed owing to cold weather. There is a slightly larger spring demand for small coal cooking constructions and laundry apparatus than a year ago. Five and six hole portable ranges have taken a fresh start in the face of the

many appliances and constructions for the use of oil, gas and gasoline calculated to reduce the demand for small coal stoves at this season and despite the ridiculous competition on them.

It is a question if the strife that has been going on with such goods has not caused the dealers to turn their attention and endeavors back again to coal stoves, on which they can now make more money. When hot plates are cut so in price that through accident the breaking of one stove eliminates the profit on a dozen either to manufacturer or dealer, interest wanes and the time for a sober understanding for mutual advantage is at hand. The effort of local manufacturers to sustain prices is made difficult by endeavors of remote foundries to procure new markets for their stoves, and many "samples" are dumped hereabouts at cut prices.

Ohio Stove Trade.

Confidence, the quickening influence of all industries, is evidently growing in this section and among the stove foundries it is gratifying to note its influence. With the passage of each month, it is evident that there is a larger proportion of manufacturers who think and write more encouragingly concerning the outlook and respecting the business in hand. Manufacturers seem to feel the relief from the depressing influences of the panic more and more, but at the same time it is evident that they retain a conservative sentiment and are therefore not disposed to discount any developments of the future. Taking into consideration the few unfavorable returns made, it is still evident that the volume of current business is increasing, being very much larger than a year ago, and in not a few instances shows an improvement over the transactions of 1892. But while the number of orders and the aggregate amounts make favorable comparisons, the net returns upon capital invested are not specially gratifying; still the improvement has been so great that it places a check upon those who are still disposed to grumble.

Cincinnati iron factors state that stove foundries are not conspicuous as large purchasers of iron but that the contracts placed indicate they are melting heavier than might be expected, considering the conditions, at this season. The hardening tendency of the market for pig metal which will naturally follow the advance in coke and Bessemer iron, and the liberal pur-

chases of foundry grades by large buyers, may have stimulated smaller buyers, urging them to depart more from the policy of hand-to-mouth purchases, and thus the buying may be the covering of probable future contingencies rather than indicating present activity.

It is gratifying to note that dealers are less disposed to throw all responsibility upon manufacturers, being willing to assume a greater proportion of risk in carrying goods than heretofore, which is a sign of confidence not lost upon foundries and may react with benefit. The more progressive manufacturers seem to feel more disposed to make changes in patterns which have before been contemplated, but from which founders have shrunk because of the expense and the seeming little appreciation of buyers. But as the signs point to a fuller and wider employment of the people, the views of manufacturers become less pessimistic; still there is not disposition to sacrifice what little has been gained and changes are made with caution.

The William Miller Range & Furnace Company

of Cincinnati, Ohio, favor us with a copy of their 1895 catalogue of Miller-Monitor steel plate ranges and hotel kitchen implements. The volume is of liberal proportions, measuring 11½ x 14 inches in size, consists of 77 pages of letterpress profusely illustrated, and is bound in board covers with side title printed in old gold and green upon a dark ground. The wrought steel ranges illustrated and described cover an extensive assortment, being adapted for private families, hotels, restaurants, boarding houses, public institutions, steamboats, dining cars, railroad camps and army posts. The pages of the catalogue also give attention to steam tables, carving tables, broilers, portable ovens, laundry stoves, water heaters, steam plate warmers, chop house broilers, waffle stoves, tea and coffee urns, steam jacketed kettles, &c. Directions are given for ordering ranges and repairs, a descriptive repair sheet being presented among the closing pages of the catalogue. The company have made a number of important additions to their line, among them being the Miller Monitor wrought steel family range, embodying the latest features; the Vigilant, wrought steel range, adapted for using soft coal, hard coal, crushed coke, wood or natural gas; the Puritan, made with single oven and adapted for using soft coal, coke or wood; the Miller-Monitor wrought steel French range, especially adapted for restaurants or small hotels, and provided with the company's non-warping indestructible oven bottom, and the Miller Monitor wrought steel French range for hotels, restaurants and public institutions. This consists of two

sections, has two fires and two ovens, and is intended for burning soft coal, hard coal or coke. The company have also added to their assortment a combination carving and serving table with galvanized plate warmer, although it can be supplied without plate warmer if desired; Miller's coffee, tea, chocolate or milk urn, lined with white enamel urn cylinder, and having a capacity ranging from 3 to 15 gallons; Miller's improved battery of nickel plated coffee and tea urns with elevated hot water urn, which is referred to as "the hand-somest, most complete and only perfect battery of urns in the market;" a galvanized plate warmer with stove attached, the heat being furnished from coils of pipe connected to the water back in the stove; a line of seamless steam jacket kettles constructed of cast iron; seamless cast iron vegetable boiler and steamer; copper steam jacket kettle, and a new table for the use of cooks. The catalogue is arranged with a great deal of care, and the illustrations are accompanied with sufficient descriptive text to enable the dealer to readily comprehend the important features claimed for the goods referred to.

ODD PLATES.

PRESS DISPATCHES from Dowagiac, Mich., under date of March 31, are to the effect that one of the warehouses on the Round Oak Stove Works at that place was destroyed by fire, entailing a loss of about \$15,000. The warehouse contained stove trimmings.

THE ANNUAL MEETING of the S. M. Howes Company, Boston, Mass., was held at their office Saturday, April 6, and the following officers were elected: J. E. Frenning, president; F. V. Streeter, vice president, and G. S. Hedge, treasurer.

THE GREENLEE BROTHERS have sold their interest in the Collins & Burgie Company, stove manufacturers, and the control of the company is now vested in citizens of Marengo, Ill., at which place the foundry is located. Although the Greenlee Brothers are no longer members of the company, a Chicago salesroom and sample room will continue to be maintained at their place of business, 227 West Twelfth street. The new officers of the company are as follows, all at Marengo: R. M. Patrick, president and treasurer; S. K. Bartholomew, vice-president; J. W. Osborn, secretary; Albert Moffat, general manager.

CHARLES C. RUSHMORE, the popular bookkeeper at the Clinton foundry of the Fuller & Warren Company, Troy, N. Y., has resigned his position and will visit Colorado for his health.

GRANGE SARD, vice-president of Rathbone, Sard & Co., Albany, N. Y., has returned from an enjoyable trip across the water.

FOR SOMETIME necessary repairs have interrupted the work at the foundry of the Littlefield Stove Company, Albany, N. Y., but the plant has again resumed operations with a bright prospect for a good season.

THE destruction by fire of the buildings of the Chelsea Stove Company, owned and operated by F. P. Glazier & Co., Chelsea, Mich., throws out of employment about 50 hands and entails a loss of about \$50,000, partially covered by insurance. We understand the intention of Mr. Glazier is to rebuild the plant this spring.

THE BUILDING formerly used as an annex foundry by Rathbone, Sard & Co., Albany, N. Y., has been converted into a mill, where a newly organized company will manufacture felt for use by paper manufacturers.

THE WHITING CUPOLA is described in a catalogue issued by the Whiting Foundry Equipment Company of 225 Dearborn street, Chicago, Ill. This cupola was originally designed as a fuel saver, and it is stated that experience has proven it to be this and much more. It gives lining, repairs and time and gives improved quality of castings. The great satisfaction given by this cupola is largely due to the patented arrangement and construction of the tuyere system, which is so designed as to distribute the blast more efficiently, carrying it to those portions of the cupola where it will do the most good, under a reduced pressure and through an increased area. There are two rows of tuyeres. The lower ones are arranged to form an annular air inlet, distributing the blast continuously around the entire circumference of the cupola. This system of tuyeres is also arranged to be adjusted vertically. This provides for adjustment to the class of work, kind of fuel and changes in the inside diameter of the cupola. These tuyeres are flaring in shape and admit the blast through a small area which is expanded into a large horizontal opening on the inside of the cupola, thus permitting the air to reach the fuel through an area nearly double that through which it enters the tuyeres—admitting the same volume of blast but softening its force. There is an upper row of tuyeres of similar construction to supply sufficient air to utilize to the fullest extent the escaping carbon gas. These tuyeres are of great service in melting and in large heats; for small heats they may be closed by means of the improved tuyere dampers. The catalogue gives a list of the more prominent uses of this cupola and makes extracts from letters received which indorse it in the highest terms.

"GAS COOKING RANGES, GAS GRATES AND HEATING STOVES" are the subjects considered in an exceedingly attractive catalogue which reaches us from F. & L. Kahn & Brothers, Hamilton, Ohio. The 68 pages of which the volume is composed carry illustrations of numerous lines of handsomely decorated goods, while the covers, printed in colors, show a bird's-eye view of the company's plant together with a brief description of it. The gas ranges are made under the generic name Estate, and embrace a varied series adapted to meet the requirements of small and large establishments. The Waldorf broiler and roaster is intended for using any kind of gas and possesses the very latest features of construction. The I X L Family Peerless is a very durable and compact construction designed to do all kinds of cooking, broiling, roasting and baking with an economical consumption of gas. The roaster and broiler are situated below the top and are of sufficient capacity to meet ordinary requirements. The oven has a drop door, which when opened forms a shelf, while vessels intended to be kept warm may be placed on the extreme top of the oven. The broiler burner measures 7 inches in diameter and the cooking burners 4½ inches in diameter. The Bijou Junior is a novelty in the way of hot plates, having a large flush top, portable cover grates and ample space for an oven. The Keystone and Sweepstake are neat hot plates made with one, two and three burners.

A variety of open front gas heaters are shown in the catalogue, being offered under such names as the Victor, Triumph, Champion, Floral Estate and Charming. An interesting line of gas radiators is illustrated and described, together with several varieties of sheet iron cylinder stoves for gas; the Ideal Estate Franklin and the Mozart Grand square parlor stove, the last two being intended for burning natural gas.

THE WALKER & PRATT MFG. COMPANY of Boston, Mass., have issued an eight-page pamphlet of pocket size containing copies of a few of the letters which they have received from customers relative to their new Culinet range. These letters are from various sections of New England and speak in very flattering terms of the satisfaction which the stove has given.

THE J. F. PEASE FURNACE COMPANY of Syracuse, N. Y., are distributing their annual price list for 1895, which consists of a 28-page pamphlet. The price-list is intended to take the place of all lists issued previously. None of the old heater or furnace lists have been changed except those of Tropic Furnace No. 310, but some of the list prices of registers, iron pipe, &c., included in the price-list for 1894 have since been changed. The company have also issued a special circular calling attention to their new goods and improvements for this season. The circular relates to the 1895 pattern of the Economy warm air furnace adapted for burning hard or soft coal. It is stated that the McClave T grate, the hollow bar revolving grate or the anticlinker grate can be used in all sizes of this furnace, as may be desired. The heater is designed especially for use in low cellars, and embodies principles of construction and operation similar to those of the regular pattern furnace. The air blast apparatus employed in connection with the heater is illustrated and described, while a table gives the weights, measurements, capacities, &c., of the various sizes.

THE CRAIG REYNOLDS FOUNDRY COMPANY of Dayton, Ohio, have recently established an agency for the sale of their Triumph heaters with the Lithgow Mfg. Company of Louisville, Ky., who will supply the trade in the South, and with the Blackmore Heating Supply Company of 101 Beekman street, New York City, who will handle the goods of the company in Eastern New York, New Jersey and New England. Other agencies of the Craig Reynolds Foundry Company are controlled by George D. Hoffman of 82 Lake street, Chicago, and the Pittsburgh Heating Supply Company, 100 Wood street, Pittsburgh, Pa. Arrangements are also under way for the establishment of agencies at Philadelphia, Washington and Dallas, Texas. Traveling salesmen report the outlook for trade better than for the corresponding period in any previous year, and the factory of the Craig Reynolds Company is being run almost to its full capacity, while the daily shipments of the company are as large as those made last fall.

THE S. OBERMAYER COMPANY of Cincinnati and Chicago have just received a cargo of Esst India plumbago direct from Colombo, Ceylon, which is probably the largest shipment of fine, high grade silver lead, or graphite, ever imported. It required 50 cars to carry it from the port of entry to its destination. This plumbago will be used in the manufacture of their standard grades of foundry facings. Business is very fair,

being greatly improved over what it has been.

W. B. WILKINSON, 210 Water street, New York, is showing a new range specially adapted for builders' use. It is made with both a single and double oven under the name Welcome. The double oven range is provided with four cooking holes over the fire, and all the ranges are provided with a warming closet. One of the features which will specially recommend it is the grate arrangement. By simply releasing a small button, the form in which the triplex grate bars rest may be withdrawn from the range. A sifter grate is arranged for efficient service, and can be entirely lifted out of the range when desired. The range is attractive in design and ornamented with nickel plate.

W. H. LANDERS of the Syracuse Stove Works, Syracuse, N. Y., made some calls among the trade in New York City this week. He was accompanied by John Kernan of the Kernan Furnace Company.

WE HAVE RECEIVED from Isaac A. Sheppard & Co., Philadelphia, a perpetual calendar, which is adapted for use until the year 2002. It is furnished in a morocco leather case, with the name of the house in gilt at the top, and in gilt letters around the edges is "Excelsior Ranges, Fidelity Ranges and Paragon Furnaces." In red figures above the figures giving the day of the month the day of the year is given, from which we learn that the year was specially arranged for the benefit of the stove dealers, as the last day of June, when the year is supposed to be half gone, occurs on the 181st day in the year in all years but leap year, when it is the 182d. Consequently the half year which belongs to the stove trade in all cases contains 184 days. The calendar is arranged with a stand so that it may be set up on the desk for use. Under the stand directions for its use are given, by which the day of the week on which any particular date falls between 1753 and 2002 can be readily found.

S. FAITH & Co., 229 Market street, Philadelphia, are making a display of the Peerless gas stoves and ranges. They are also showing the Reliable line of gasoline goods, and to complete their summer line they have the Glacier refrigerators. Wm. G. Semple is one of their representatives, well known to the trade through his frequent visits.

SPICER STOVE COMPANY, Providence, R. I., are offering the Model line of ranges this season with some changes designed to add to their efficiency and beauty.

J. P. LINDEMAN & SONS of Milwaukee, Wis., have issued a folder suggesting to dealers that they buy their portable ovens direct and thus effect a saving in freight, money and space. The ovens referred to are so constructed that they may be folded or "knocked down" and packed six in a crate. The ovens are made in various sizes and the firm state that they nest solid so that there is no damage in shipment. They are referred to as having full flue construction, invisible hinges making the bodies and linings one solid section, automatic top, and that they may be instantly set up for use.

W. K. WEST, assistant treasurer of the J. F. Pease Furnace Company, Syracuse, N. Y., has just completed arrangements with W. A. Eckerman of 1026 Lorain street, Cleveland, Ohio,

to handle the company's entire line of heating apparatus in Cleveland and vicinity. Mr. Eckerman is an energetic and successful business man in the stove and hardware trade and now intends to make heating apparatus one of the prominent features of his business. He has recently purchased and placed on his floor nine sample heaters and has also given an order for a carload of heaters for stock. The company state that the business outlook for this year is better than at the same time a year ago, a noticeable feature being the increase in volume since the fall elections, this expansion being stated as something like 30 per cent. The company also report that their sales for March of this year were nearly double those for the corresponding month of 1894.

GIBLIN & Co. of Utica, N. Y., have issued a catalogue of their furnaces and combination heaters which are manufactured in a number of varieties. Illustrated descriptions are given of the Standard, Rival, Standard Steel, Standard Junior improved for 1895, the Standard Smokeless and the Standard Tubular furnaces. There is also shown the Standard hot water combination heater and the Standard steam combination heater, together with a description of the reverse motion grate and the new style of radiator used on the company's Rival furnaces. Several pages at the close of the catalogue are devoted to remarks on fuel, illustrations of grate bars, hints to furnace buyers, together with a list of questions to be answered when information is desired as to the size of furnace needed to heat any particular building. The company have also issued a 20 page pamphlet relating to their furnaces and intended for the exclusive use of dealers.

J. REYNOLDS & SON, manufacturers of furnaces and patent grates, have sold their property at the corner of Filbert and Thirteenth street, Philadelphia, Pa., where they have conducted business for 46 years. The price is said to be in the neighborhood of \$100,000. The firm are removing to a new location at Seventeenth and Filbert streets, four blocks west of their old location, where they expect to do a larger business than heretofore and to increase their line. The firm appear to be keeping fully up to the times in thus moving a little further "West."

THE STANDARD RANGE & STOVE COMPANY, recently organized at Terre Haute, Ind., have issued a little pamphlet calling attention to the Standard range which they are offering the trade. Among the features embodied in its construction are what is termed the indestructible water fire pot, which can be flushed and cleaned from all sediment and also emptied to prevent freezing; a self basting ventilated oven; draw out fire grate; patent oven door opener; self basting roaster and draw out oven. The water fire pot is oval in shape and is so placed as to allow the water to circulate completely around the fire, thus preventing its burning out. The grate is of the duplex type, and can be removed without disconnecting the water fire pot. The range is also provided with a gas attachment so that a coal fire may be dispensed with in summer.

THE J. F. PEASE FURNACE COMPANY, Syracuse, N. Y., are receiving this spring a number of inquiries from abroad due, they believe, to their display at the World's Columbian Exposition. The company have received inquiries from as far East as India, and in

the mail last week was an order from a prominent concern in Lsken, Belgium.

LAST YEAR White, Warner & Co., of Taunton, Mass., built an addition to the rear of their foundry, but owing to the business depression it has not heretofore been used. The company are now about to put it in operation, which will increase the capacity about one third.

HEATING & PLUMBING.

NEW WORK AND CONTRACTS.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until May 7, for the steam heating and ventilating apparatus for the United States Custom House and Post Office Building, at Newark, N. J., in accordance with drawings and specifications, which may be obtained from the Supervising Architect, Washington, or from the superintendent at Newark.

HENRY BREYER, 1725 Milwaukee avenue, Chicago, is to do the plumbing and drainage in the flat building of Herman Katz, Hammond avenue and Roscoe street.

McKEOUGH Bros., Utica, N. Y., have been awarded the contract for connecting the engine, boilers, pumps, tanks, &c., at the new Oneida County Home at Rome.

THE City Property Committee of Holyoke, Mass., has been instructed to advertise for bids for repairing the ventilating machinery of the Nonotuck and Hamilton street school buildings.

T. J. LEONARD, Marlboro, Mass., is putting plumbing work into Thos. P. Hurley's three new houses.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until May 3, for removing the old steam heating apparatus and putting in a new low pressure system in the United States Custom House and Post Office Building, at New Haven, Conn., in accordance with the drawings and specifications, which can be had from the Supervising Architect, at Washington, or from the custodian at New Haven.

THE COUNTY COMMISSIONER, at a meeting at Warsaw, Ind., awarded the contract for plumbing the new County Infirmary to J. D. Madden of Fort Wayne for \$2142, and the contract for heating to J. D. Kutz of Warsaw for \$1994.

PAUL DEWEES has established a successful business in plumbing, hot water and steam heating, at Huntingdon, Pa., and has already nine hot water jobs on hand, as well as the plumbing for the Juniata College of that place. Mr. Dewees advises us that he will be glad to receive catalogues from manufacturers and dealers in goods in his line.

BUILDING INSPECTOR OSTER of Baltimore has reported to Mayor Latrobe the result of an inspection of the old United States Court House, preparatory to its being taken possession of by the city. The inspector found the heating apparatus in such a condition as to render a new system necessary.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until April 20 for the work, including plumbing for the United States Court House and Post

Office Building at Martinsburg, W. Va. Drawings and specifications may be had from the Supervising Architect, Washington, or from the Superintendent at Martinsburg, W. Va.

LAWRENCE SULLIVAN & Co., Taunton, Mass., have the contract for plumbing the new house of George F. Seibel on Broadway.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until April 30 for work including the plumbing of the United States Post Office Building at Columbus, Ga., according to drawings and specifications which may be obtained from the Supervising Architect, Washington, or from the Superintendent at Columbus, Ga.

THE ALBERNE STONE COMPANY, 217 Lake street, Chicago, are to furnish 36 laundry tubs for the Dubuque apartment building, Rush and Indiana streets.

F. O. SINGER & Co., Baltimore, Md., have closed a contract for the entire plumbing work for 22 houses to be erected in that city. Each house will be fitted up with two bathrooms, and the contract amounts to about \$14,000. This firm have just completed an addition to their plant, 40 x 180 feet in size and three stories high.

GOULD & NOWLEN, Bath, N. Y., have the plumbing contract for the new depot at Hammondsport, Taylor's Hotel, at Gibson's Landing, and the Washburn Hotel, at Keuka.

THE SANITARY ARRANGEMENTS of the Hanover House, Manchester, N. H., are to be thoroughly overhauled, and this summer steam heating apparatus is to be introduced.

THE PLUMBING CONTRACT for the Locust Street School Building, Dover, N. H., was awarded to John Baty.

THE CONTRACT for furnishing a heating plant to the new Court House, Toledo, Ohio, goes to the Shaw, Kendall Company for \$21,974. The Powers system of heat regulators was adopted.

THE ARNOLD COMPANY, New Haven, Conn., have taken the contract for the plumbing of the four houses now being built on John street by Clark & Thompson; the plumbing and furnace heating of Mrs. G. Turner's house on Winthrop avenue; the Perfect hot water heating in F. Kirchoff's house on Maple street and I. L. Stille's house in North Haven; also the plumbing of C. P. Thompson's new store on Orange street, and the heating, plumbing and tinning in G. P. Butler's new house. They will do the plumbing in houses for F. S. Porter, where they will put in seven lavatories, Peck fixtures being used, with enameled bathtubs, nickel fixtures and all the modern features of first-class plumbing.

THE SANITARY PLUMBING COMPANY, Norwich, Conn., have just completed a standing lock seam tin roof on the residence of E. Clain, and also have the contract for the plumbing and lighting of the same house.

J. J. TOOMEY has let the contract for the plumbing of the Magurill Block to Tompkins & Murphy, Norwich, Conn.

MRS. JANE K. MATTHEWS, New Haven, Conn., is to erect a \$50,000 residence which will have three bathrooms and a fine system of plumbing. It will be heated by indirect steam or hot water.

FRARY & Co., Dover, N. H., have the contract for the heating plant in the Hale School and will use a Smith & Anthony Company apparatus.

THE TOWN of Hinsdale, Mass., has voted for placing 100 hydrants about the town.

THE BOARD of PUBLIC WORKS of Louisville, Ky., are advertising for bids for renovating the plumbing of the City Hall. An appropriation was made for this purpose some time ago. It is estimated that the repairs will cost \$8500.

MCCAULEY Bros., St. Louis, have secured the contract for the heating and ventilating apparatus of the Ashland School for \$2732 and of the Washington School for \$1871.

THE G. S. BLODGETT COMPANY, Burlington, Vt., have secured the contract for the heating and plumbing of the new United States Hospital, located at the barracks at Plattsburg. The total contract will amount to nearly \$10,000.

CROSSMAN & POLMATTER, Florence, Mass., are to do the plumbing and steam heating for the new Boyd House at Haydenville.

JAMES H. FERGUSON & Co., Millbury, Mass., were awarded the contract to do the plumbing in the 11 tenements of the six new houses of the Millbury Land Company on the Walling land. There will be required $3\frac{1}{2}$ tons of lead pipe, 425 feet of soil pipes and 11 each copper pressure boilers, bathtubs, set bowls and slabs and water closets.

CONTRACTS for heating the Maxfield and Hawthorne schools at St. Paul, Minn., have been awarded, respectively, to the Dwyer Plumbing & Heating Company for \$759 and to Geo. A. Kees for \$745.

DORE & SON, 1042 West Van Buren street, Chicago, have the contract for the plumbing and drainage in the flat building of A. G. Heutz, 33 Balter street.

RICHARD TAIT, 605 Sixty-ninth street, Chicago, is to do the plumbing and drainage in the flat building of G. L. Davis, 6720 Wright street.

JOHN H. SULLIVAN, 328 Division street, Chicago, has the contract for the plumbing and drainage in the flat building of J. T. Marks, 9 Cedar street.

KEEFE & WARNOCK, 1105 Lincoln avenue, Chicago, are to do the plumbing and drainage in the five flat buildings of Camp & White, St. Elmo street, Lake View.

THE JOHN F. ALLES PLUMBING COMPANY, 233 and 235 Lincoln avenue, Chicago, have the contract for the plumbing and drainage in the flat building of George F. Smith, 260 Seminary avenue.

FRANK MEEK, 486 West Eighteenth street, Chicago, is to do the plumbing and drainage in the flat building of R. Skata, 394 Seventeenth street.

WILLIAM MAROFESKE, 376 West North avenue, Chicago, has the contract for the plumbing in the flat building of J. Kuschnick, on Barclay street.

WILLIAM READ, 345 Forty-third street, Chicago, is to do the plumbing and drainage in the flat building of Isaiah Breat, 4833 South Ashland avenue.

ANDREW W. AITKEN, 2314 West Harrison street, Chicago, has the contract for the plumbing and drainage in the residence of C. Kayrn, 2549 Miller street.

WILLIAM BLETSCH, 1216 Belmont avenue, Chicago, is to do the plumbing and drainage in the flat building of H. G. Sindera, 947 Seminary avenue.

THE PLANS for the heating and ventilation of the new training school dormitory at Springfield, Mass., have been received from the Buffalo Forge Company of Buffalo, N. Y., and bids will be advertised for.

SEALED PROPOSALS will be received by the Committee on Heating of the Board of Education of the city of Newark, N. J., until April 17, at a meeting to be held in the City Hall for: 1. New boiler for the Chestnut street school house. 2. For repairing and moving boiler now in Chestnut street school house to the Commerce street school house. 3. For placing boiler in Elizabeth avenue school house. 4. For building a brick chimney and setting boiler in the Chestnut street school house.

JAMES RUSSELL, Pottsville, Pa., has been awarded the contract for doing the plumbing in the Y. M. C. A. gymnasium rooms.

THE MATTHEWS & WILLARD MFG COMPANY, Waterbury, Conn., and 40 Murray street, New York, are offering a very attractive new line of Aluminum Chafing Dishes in two sizes and nine or ten patterns. The Chafing Dish, cover and water pan underneath are warranted strictly pure aluminum and superior for cooking delicate materials. The standard, alcohol Lamp and cover are of burnished copper, except a few patterns which are made with standards of aluminum. This company also make a handsome line of parlor, boudoir and banquet Lamps in the various finishes, together with onyx and gold Tables, Cabinets and other art goods of analogous character.

On March 28 27 cars laden with cotton goods were dispatched from Biddeford, Maine, via the Canadian Pacific Railroad to China. This shipment is regarded as important as showing that the trade with China in this line of American products is increasing. The competition between American cotton goods and those of England, France and Germany in the markets of the Orient has hitherto been very keen; and the growing preference manifested in China and other parts of the East for the manufactures of this country is very gratifying. Consular reports indicate the fact that American goods are gradually acquiring the supremacy in the Eastern markets owing to their intrinsic merit.

The Belgian Government has informed the State Department at Washington that the discriminating duties against American food products, recently imposed, has been repealed by a royal decree.

The failure of the Florida orange crop has entailed the suspension of the Philadelphia Steamship Company, who have announced the discontinuance of their service from Philadelphia to Charleston, S. C., and Jacksonville, Fla.

TRADE REPORT.

The Iron Market.

The Ore buying movement has practically ended, nearly all the leading interests west of the Alleghany Mountains having covered their supplies of Ores from the older ranges, while quite a good deal of Mesabi Bessemer has also been placed.

The question of cost of raw materials is settled for the present. Coke contracts are being entered to a moderate extent up to July, beyond which prices are not being made. It is intimated that after that a further twist is to be given.

One uncomfortable feature, so far as the demand is concerned, is the discouraging state of affairs in the Wire trade. Earlier in the year jobbers bought quite heavily, but the consumers do not seem to be taking hold vigorously.

In Bars in the West the conference among the makers has led to a decidedly firmer feeling and an actual modest advance in prices. In Sheets and Galvanized Iron the demand is satisfactory and prices are steady.

The movement in Foundry Pig Iron throughout the country has been moderate during the past week, but a more hopeful feeling prevails.

Merchants and manufacturers are getting a good many inquiries for export, and are doing a good deal of missionary work, with, as yet, very modest results so far as tonnage is concerned.

An incident occurred this week which shows that we are beginning to step on the heels of even the Germans, who have been the most aggressive sellers in recent years. An order came into this market for 1000 tons of Barrel Hoops. An American mill bid as low as any German works and would have obtained the order if there were not a duty of about \$7 per ton on Hoops in Germany. In other words, with equal rates of freight and short credits we can meet them successfully in neutral markets.

In the New York market low offerings continue to be made both by Northern and Southern furnaces to capture what moderate volume of trade is going in this district. There has been some renewed interest in warrants lately, about 2000 tons having been sold on the basis of \$6.40 for No. 2 Soft and \$6.65 for No. 1 Soft, cash, Birmingham. We quote \$12 @ \$12.50 for No. 1; \$10.75 @ \$11.25 for No. 2, and \$10.25 @ \$10.50 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.25 @ \$11 for No. 2; \$10 @ \$10.25 for No. 2 Soft, and \$10.50 @ \$10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.50 @ \$10.

In the Philadelphia market Neutral Irons are in good demand, and are promptly taken at last week's prices. Sellers see nothing to warrant them in asking more money, as there is plenty of Iron for sale and in the majority of cases holders are glad to accept quoted rates for prompt shipments. There is more doing than at any time for months

past, and to that extent things are better, but the ample supply explains the torpidity of prices. Prices are about as follows for Philadelphia delivery, and 20¢ @ 25¢ less for points within a radius of 100 miles South or West:

Standard No. 1 Foundry X.....	\$12.00 to \$12.50
Standard No. 2 Foundry X.....	11.25 to 11.50
No. 1 Plain.....	10.75 to 11.00
No. 2 Plain.....	11.50 to 11.75
No. 2 Soft.....	10.75 to 11.00

Local manufacturers of Coke Pig Iron in the Chicago district have advanced their prices on every grade on account of higher cost of Coke and Iron Ore. The week was one of quite heavy transactions and sales were made at the advanced figures. Manufacturers talk very confidently of their ability to sustain the new rates and even predict a higher price in the near future. Large inquiries are in the market, and if all the business now in sight should materialize the buying movement will be the largest for many months. Prices on Southern Iron have not been advanced to correspond with the higher prices named on Northern Iron, but a decidedly firmer feeling is manifested, and it will not be surprising if buyers will shortly be obliged to pay more money for Southern Iron also. Consumers are now taking Iron much more freely on old contracts and in many instances are exceeding their expected requirements. Quotations are as follows for cash:

Lake Superior Charcoal.....	\$12.75 to \$13.00
Local Coke Foundry, No. 1.....	10.50 to 10.75
Local Coke Foundry, No. 2.....	10.25 to 10.50
Local Coke Foundry, No. 3.....	9.75 to 10.25
Local Scotch No. 1.....	10.50 to 11.00
Ohio Strong Softeners, No. 1.....	13.00 to 13.50
Southern Silvery, No. 1.....	11.75 to 12.00
Southern Silvery, No. 2.....	11.50 to 11.75
Southern Coke, No. 2.....	10.00 to 10.25
Southern Coke, No. 3.....	9.50 to 9.75
Southern, No. 1, Soft.....	10.00 to 10.25
Southern, No. 2, Soft.....	9.75 to 10.00
Alabama Car Wheel.....	17.50 to 18.00
Jackson County Silvery.....	15.00 to 15.25
Other Ohio Silvery.....	14.25 to 14.50

Very little is doing in Foundry Iron in the Pittsburgh district and prices are unchanged, quotations being as follows for cash:

No. 1 Foundry.....	\$10.25 to \$10.50
No. 2 Foundry.....	9.75 to 10.00

Reports from Cincinnati indicate more activity among consumers of Pig Iron and a more confident feeling among furnaces in that section. There has been an absence of large sales, but yet the aggregate tonnage has been well up to that of the previous week, indicating a wider and freer distribution of Iron. Southern furnaces are sold ahead to a considerable extent and feel more independent, refusing any business not closely upto the established level of the market as quoted. Northern furnaces anticipate an advance on Foundry Irons, especially as the market has been relieved of many odd lots of Iron which accumulated last year and have choked the market like brambles, so that now there is a clear field and a more encouraging outlook. There have been quite a number of orders ranging between 100 and 500 tons and innumerable carload lots. There is no special animation or feature at the close, but a good, steady, healthful movement promising encouragement, but no extraordinary developments. Quotations are given as follows:

Southern Coke, No. 1.....	\$9.75 to \$10.00
Southern Coke, No. 2.....	9.00 to 9.25
Southern Coke, No. 3.....	8.50 to 8.75
Ohio Soft Stone Coal, No. 1.....	14.20 to 14.50
Ohio Soft Stone Coal, No. 2.....	14.00 to 14.50
Lake Superior Coke, No. 1.....	11.75 to 12.25
Lake Superior Coke, No. 2.....	10.75 to 11.50
Hanging Rock Charcoal, No. 1.....	16.00 to 16.50
Hanging Rock Charcoal, No. 2.....	15.50 to 16.00
Tennessee Charcoal, No. 1.....	13.00 to 13.50
Tennessee Charcoal, No. 2.....	12.00 to 12.50

Metal Market.

Pig Tin.—There have been several fluctuations in the wholesale price of Pig Tin. Early in the week prices receded for prompt and current month deliveries, considerable business being done at the lower rates. Then prices rebounded 0.20¢, receding later about one half that figure, and at the close of the week regaining the loss, the market closing firm. Arrivals from London have been quite heavy, but the greater portion went out on old contracts, and the estimated full supply had no unfavorable influence. Quotations on small lots of Straits from store are unchanged from last week, viz., 14½ @ 15¢ per lb.

Copper.—The condition of the market has not changed in any great degree, but, superficially, shows better tone consequent upon more reserved offering and very fair demand. The Calumet & Hecla Company are said to have recently placed 2000 tons. General consumption is reported as fairly up to the average for the season and retail business is fairly brisk. Prices for small jobbing quantities are unchanged on a basis of 10½¢ for Lake Ingot.

Pig Lead.—Wholesale prices for Common Western have eased off for prompt and near future delivery. The decline is partly due to speculative realizations, but cut rates on east bound freight have had some influence, and prospective larger production has also stimulated selling interest in some degree. The retail demand is moderate and prices for small lots of American from store are unchanged, ruling at 3½¢ @ 3¾¢ per lb.

Spelter.—A steady tone characterizes the market. There has been only moderate trading here and little life to demand, but short interest elsewhere and liberal deliveries have had sufficient force to hold prices quite firm. Small parcels of good Western brands from store rule at 3½¢ @ 4¢ per lb.

Sheet Zinc.—The volume of business is small. Prices for 600 lb casks are on a basis of 4½¢, with smaller lots from store quoted at 5¢ per lb.

Antimony.—Competition is keen and prices are rather weak. In small lots, Hallett's is quoted at 8¢, and Cookson's at 9½¢ @ 9¾¢ per lb.

Tin Plate.—Buying interest has slackened off considerably both for prompt and future deliveries. The canning demand is the only quarter in which any life is visible, and the requirements of this class of consumers is disappointing as to volume and below the average for the season. The market is in a slow routine condition. Re-

ing an excellent movement in this regard.

Notes on Prices.

Wire Nails.—The situation in Wire Nails is substantially the same as for the past week or two. The volume of business is fair and with the large orders recently placed the manufacturers are fully occupied. An evidence of the improvement in general business is seen in the fact that some parties are requesting that shipments be made a little earlier than was first stipulated. Prices are without change, and on the whole quite well maintained. Manufacturers refer to the indications as pointing to a steady demand during the season.

Advices from Chicago.—Manufacturers have passed through a quiet period since last report, although a good inquiry has been received by most of them. Buyers, however, appear to be waiting either to test the market thoroughly or to see whether the demand from their own customers will warrant the purchase of much stock. The quietness has as usual led to a little unsettling of values, but carload lots are held fairly well at \$1, Chicago. Jobbers are not having quite so large a trade from stock, and continue to quote \$1 to \$1.05 for small lots.

Cut Nails.—The prices referred to in our last issue as adopted by the Eastern manufacturers are quite well maintained, as follows: For carload lots at mill, 70 cents; for less than carload lots at mill, 80 cents; and for small lots on dock or from store in New York, 90 cents; the above quotations all being made on the basis of 60-cent average, with an advance in the base price where the average is less. The volume of business is somewhat larger.

Advices from Chicago.—Manufacturers are in receipt of about the usual number of orders. Prices are continued on the basis of \$1 for small lots from stock.

Barb Wire.—There is a good demand for Barb Wire and prices, while there are evidences of irregularity, are on the whole quite well maintained.

Advices from Chicago.—The volume of business in Barb Wire appears to have been somewhat better than on Wire Nails. The movement from factories in this vicinity has been considerably larger. Manufacturers in other sections, however, have not been so well supplied with orders as the local concerns, and efforts have been made to secure more business by a slight reduction on price. Small lots from stock are quoted at \$1.65 for Painted and \$2 for Galvanized Wire.

Sash Ribbon.—The Aluminum Bronze Sash Ribbon put on the market by Austin & Eddy, 117 and 119 Broad street, Boston, Mass., is sold from the following list, which is subject to a discount to the trade of 70 per cent.:

5-16 Inch Wide.		
No. 122, for Sash weighing not over 20 pounds.....		Per foot. \$0.3
3-8 Inch Wide.		
132, for Sash weighing not over 30 pounds.....		3½
133, for Sash weighing not over 50 pounds.....		4½
134, for Sash weighing not over 75 pounds.....		5½
1-2 Inch Wide.		
154, for Sash not weighing over 100 pounds.....		6½

Solid Emery Whetstones.—The Tanite Company, Stroudsburg, Pa., have reduced prices on their solid Emery Whetstones. The goods are now quoted at \$5 per dozen (instead of \$9 per dozen as heretofore), subject to a discount of from 50 to 60 per cent., according to quality.

Glass.—A meeting of the Indiana Glass manufacturers was held at Indianapolis, April 2, at which time, it is understood, they agreed to advance prices to 89 per cent. discount on single and 89 and 5 per cent. discount on double strength Glass. The statement is made, however, that since that meeting Indiana Glass has been sold in Chicago at from 89 and 5 to 90 and 5 per cent. discount. It will be understood that the foregoing figures represent prices on car lots of Glass. The result of the next meeting of the National Association of Window Glass Manufacturers, which was formed in Pittsburgh, March 19, will be awaited with much interest by the trade. It is reported that there are manufacturers in the territory of both the Indiana and Pittsburgh districts who are not altogether in favor of a consolidation of interests. In case no agreement is reached by the manufacturers as a result of the several meetings, the conference have probably had the effect of bringing about a better understanding, which will prove of future benefit.

Old Metals.—In its general features the market for Old Material presents no quotable change from the conditions noted last week. Prices are firmer and the demand fair. Dealers' purchasing prices for moderate sized lots, New York delivery, are approximately as follows:

Heavy Copper.....	lb 7 c
Light and Thinned Copper.....	lb 6½ c
Heavy Brass.....	lb 4½ c
Light Brass.....	lb 3½ c
Lead.....	lb 2½ c
Tin Lead.....	lb 2½ c
Zinc.....	lb 10 c
No. 1 Pewter.....	lb 12 c
No. 2 Pewter.....	lb 5½ c
Wrought Scrap Iron, gross ton.....	\$7.50 @ \$8.00
Heavy Cast Scrap.....	gross ton 7.50 @ 8.50
Stove Plate Scrap.....	gross ton 5.00
Burnt Iron.....	gross ton 3.00

Old Rags, Paper, &c.—The general condition of the market is unchanged, and dealers' purchasing quotations do not vary from those made last week, namely:

No. 1 White Rags.....	lb 3 c @ 3½ c
No. 2 White Rags.....	lb 2½ c @ 2½ c
Mixed Rags.....	lb 2½ c @ 1 c
Blues and Sides.....	lb 1½ c @ 1 c
Hard Sized White Shavings.....	lb 2½ c @ 2½ c
No. 1 White Book Shavings.....	lb 1½ c @ 2½ c
No. 2 White Book Shavings.....	lb 1 c @ 1½ c
Light Book Shavings.....	lb 1 c @ 1 c
No. 1 Mixed Shavings.....	lb ¾ c @ 1 c
No. 2 Mixed Shavings.....	lb ¾ c @ 1 c
No. 1 Printed Books.....	lb 1 c @ 1½ c
Ordinary Mixed Books.....	lb 1 c @ 1 c
Newspapers.....	lb 1 c @ 3-5 c
No. 1 Manila Paper.....	lb 1 c @ 1 c
No. 2 Manila Paper.....	lb ¾ c @ ¾ c
Bogus Paper.....	lb ¾ c @ ¾ c
Common Paper.....	lb ¾ c @ ¾ c
Straw Chips.....	lb 1 c @ 1 c
Binders' Chippings.....	lb 1 c @ 1 c
Jute Butts.....	lb 1½ c @ 1½ c
No. 1 Jute Bagging.....	lb 1 c @ 1½ c
Mixed Bagging.....	lb ¾ c @ 1 c
No. 2 Bagging.....	lb ¾ c @ ¾ c
Hemp Twine.....	lb 3 c @ 2½ c
Manila Rope.....	lb 2 c @ 2½ c
Jute Rope.....	lb 1½ c @ 1½ c
Mixed Rope.....	lb ¾ c @ ¾ c

Old Rubber.—The market is irregular and prices considerably weaker. The following quotations represent about the current rates paid by dealers in the city:

Car Springs, ton lots, lb.....	3 c @ 3½ c
Rubber Shoes, carloads, delivered at factory, lb.....	4½ c @ 4½ c
Rubber Shoes, less than carloads, lb.....	4 c @ 4 c
White Wringer Rolls, lb.....	3½ c @ 3½ c
White Syringes, lb.....	3½ c @ 3½ c

Heating Contracts.

There is a strong feeling in the heating trade that many of the contracts that have been recently placed have been at figures too low to be profitable to the trade. This, if true, may be partly due to the eagerness of those who have been slack of work during the past two years to make up the deficiency and partly to the exceptionally low price of the materials used at the present time. The figures quoted in some cases are so low that contractors of successful practice and good business reputation assert that the construction cannot be finished without a loss. It is pointed out that the contract for heating an exceptionally large building has been awarded to a bidder whose price was several thousand dollars lower than his lowest competitor, and some amazement is manifested at this occurrence. A contractor who is ordinarily well occupied reports that at the present time he is doing very little, and remarks that "when the other fellows get all the cheap work they can handle the market will not yet be fully supplied and I will then come in and get my share of work at a profitable figure." There is some probability that this statement is correct, but it requires more than ordinary courage to take such a stand. Others claim that good work is worth a good price, and there is no reason why a bad precedent should be established by taking work at low figures to keep the shop busy and give architects and contractors the opinion that buildings can be heated for a price from 10 to 20 per cent. below what should be had. Others, who are noted for their foresight in buying, state that the price of materials will be higher before some of the contracts which have been awarded are completed, and instead of the contractor making a loss, due to an advance over the present low prices, he should hold

to the old prices and secure to himself the additional profits that can be gained from close buying. Some benefit may be derived from studying the business practice of a decade or two ago, when no man in any line of business expected to be occupied for twelve months in the year, but thought to make sufficient profit during his busy months to carry him through the idle ones.

Location of Registers.

The exact proper location of supply and exit openings in rooms of the character of schoolrooms is a matter regarding which there is evident difference of opinion. Almost without exception the older school buildings, whether heated by steam or by furnace, will be found to have the supply registers at the floor usually, but by no means always near the inner walls. The outlet registers will be found as diversified in their location as are the buildings. Modern practice almost universally recommends placing the supply register in an inner wall at least 8 feet to the bottom above the floor. From this opening the air, in any system of adequate capacity, will issue at a velocity of about 400 feet per minute. This will give it sufficient impulse to cause it to pass above head level to the outer walls, where their cooling action will cause it to fall to the floor, along which it will travel in a mass toward a properly provided outlet register in the same inner wall as the supply register, but at the floor level. The most equitable heating will result from the location of the supply register so as to force the air along one cold side of the room, while the location of the outlet register in the same wall as the supply, but as far from it as possible, will compel the most complete circulation of the air within the room. Registers for exit near the ceiling are useful when the supply of air from the ventilating apparatus is replaced by that from open doors and windows in mild weather; but such registers at the ceiling should never be employed when the air supply is from the regular opening in the inner wall.

Apartment House Fires.

Within the last two weeks an extraordinary epidemic of apartment house fires has occurred in the residential district of New York City west of Central Park. The circumstances attending many of these fires point to the conclusion that they were in the majority of cases the work of incendiaries, under-

taken presumably for purposes of robbery. Only a short time ago a gang of firebugs who had been conducting their criminal industry on the east side down town district of the city was detected and broken up, its members being awarded exemplary sentences in State's prison. In their case the object was to defraud the insurance companies. In the more recent cases the evident purpose of the incendiaries has been robbery. Possibly, as has been suggested, the fires may have been started by some criminally insane person. The effect in either case, however, has been disastrous. Loss of property, and even of life, has ensued, and a general feeling of alarm has been kindled in the neighborhood. So far the crimes have not been clearly traced to their author or authors, but vigorous steps are being taken by the police department to prevent the perpetration of further damage of this character.

Incendiarism Made Easy.

These occurrences bring up the inquiry: How was it possible for incendiaries to carry out their work in this wholesale manner without detection? The fact is that property owners and tenants are themselves largely to blame in the matter. They have, in a measure, paved the way for arson by their neglect of common precautions. In the first place, in the majority of instances, apartment house cellars are left unguarded and accessible to every comer, often by night as well as by day. In the second place, in most of these houses, especially those of the older class, the dumb-waiter shafts are, as a rule, incased in wood, offering the most favorable conditions, in readily combustible material and a good draft, for the spread of a fire started below. If tenants would insist upon these shafts being fireproofed by means of metal sheathing, incasing at least their lower parts, and arrange to properly guard their cellars from intruders, their houses would be rendered comparatively safe from incendiary fire, to which, under the present hazardous conditions, they are always subject. Property owners, too, will find it to their interest to adopt these simple precautions, both by securing the safety of their property and also in a lowering of the rates of insurance. It has been announced that the fire underwriters of this city are now raising very considerably the rates on risks of this character.

Robert V. Welton, one of the founders of the Waterbury Brass Company, died at Waterbury, Conn., on April 16, aged 83 years. He represented the town in the General Assembly in 1853-54, and was supervisor of highways for 25 years.

THE LETTER BOX.

Inside Cold Air Duct.

From JACK, Ontario.—If the gentlemen who are conducting the discussion in *The Metal Worker* on inside air and other furnace topics lived here, where the thermometer quite frequently goes down to 25° and 36° below zero, sometimes accompanied by a stiff north wind, they would find all the cold air in the house they could possibly use, without trying to heat any from outside. When the temperature reaches this point buildings have to be very tightly constructed; in fact, much more so than we generally get them here, without there being enough leakage of air, around doors and windows, even with both double, to supply air for furnace and still have it quite fresh. Inside cold air, under these conditions, has proven very satisfactory here. My practice has been to set a face plate in the floor and fasten a galvanized iron box into the opening. This box is then joined by galvanized pipe of suitable size, run at cellar ceiling to the most convenient place to connect with furnace pit, if you are situated so that you can have one. Here where you can get a cold air pit under about one furnace in 50, the duct is run down at the most suitable place, even if it may be alongside the casing, and passed just through the casings immediately above the bottom ring or base. When there are several ducts they should be as evenly distributed around the furnace as possible. The cold air ducts should have a capacity equal to 80 per cent. of the hot air pipes, which gives very satisfactory results. They will even work fairly well when the former are 70 per cent. of the latter, but a smaller percentage than this will prove unsatisfactory. Most rooms that have a hot air register will require a cold air duct out, except the doors are left open so that there may be circulation of air. Cold air faces will work best in coldest part of room, near outside doors and windows, but should never be placed on second floor unless hot air is wanted through the ducts. In houses so built that there is not leakage of enough cold air around doors, windows and other parts of the house, a small duct from outside may be used with advantage when fresh air is wanted, but it must be very closely made and fitted with a damper or slide, so that it may be completely shut off if necessary. This outside air duct will be connected to the furnace in the same manner if it were from inside.

If "C. S." Cleveland, Ohio, would stop his cold air duct when he gets through the casings I think he would find no hot air come from it. He should not leave on even the elbow.

I have to take issue with "H. R. D.," Brooklyn, N. Y., in introducing the cold air, if I understand him aright, at the top of the furnace, in such a way that it will partly heat before it reaches the bottom where it passes into the furnace proper. I have seen many brick set wood furnaces that were failures as heaters, all because the cold air was brought in at the top and passed down between the walls, where it was sup-

posed to go partly heated into the furnace. The trouble was, it was changed from cold air to warm air during the passage and before it reached the bottom, consequently it went back the way it came. This condition of affairs I have found to be always cured by introducing the cold air at the bottom, when the air always traveled in the right direction.

Kitchen Boiler Heating.

From B. C. B., Maryland.—Will you please give me some information on the proposed plumbing system shown on the sketch? I have told my customer that his bathroom could be heated from the hot water boiler in the kitchen by placing a radiator or coil in the bathroom and running a pipe from the boiler to and from it. I have con-

be taken from the water back to receive the pipe from the boiler and the radiator return. Another question which must be decided is the capacity of the stove and water back to heat the additional quantity of water which will be required for heating the bathroom.

Home Made Tinware.

From A. D. SMITH, San Diego, Texas.—My experience in the manufacture of tinware in the shop as home made ware seems to be similar to that of "J. G. F. W.," Indiana, whose letter appears in *The Metal Worker* of March 9. In my case I have not made much of an effort of late to compete with factory goods by making the same grade of goods, but I use IX and IXX tin and put up a better grade of ware. I will be glad if "J. G. F. W." will send

Kitchen Boiler Heating.

cluded to refer this matter to the Letter Box, knowing that its readers are always ready to give assistance. Is it practicable to heat a room of the size in question, the room being 10 x 14, with a 7 foot ceiling? The house is built of stone, the walls being 20 inches thick. What changes are necessary to make such a system work? Must I use a coil or a radiator, and of what size and length? I would prefer to use a radiator.

Note.—The room in question being over the kitchen, it is probable that it will not be a difficult room to heat, consequently a foot of radiating surface will probably heat 30 cubic feet of space. As the room contains 980 feet, a radiator exposing 33 square feet of surface would be required. If the radiator is preferred, and there is ample space for it, there is no reason why it should not be used. The piping seems to be arranged in a manner that would produce satisfactory results if the sizes were correct. A 3/4 inch pipe is large enough to supply the heating surface in the bathroom. A 1-inch pipe should

me his name and address, as I wish to correspond with him.

Pattern for Offset, Oblong to Round.

From A. W., New York.—The demonstration in *The Metal Worker* of March 23, entitled, "Pattern for Offset, Oblong to Round," is a splendid piece of work. The drawings are so accurate and cleanly cut, the accompanying description so plain and easy to understand, leading the beginner so gradually and by such easy steps from the simple "Plan and Elevation" up to and through the more intricate mazes of triangulation. There is, however, a slight misprint in the description. It says: "From V on V W set off the length of lines in B m G, Fig. 4." It should read instead: "From V on V U," &c. This might prove a stumbling block to some young apprentice of meager education (and I am sorry to say we have too many of that class). But, on the whole, these three pages command the respect and gratitude of every tinner, especially of furnacemen, and should fill them with admiration, inspiration and gratification.

The Peppermint Test.

From INQUIRER, New York.—Will *The Metal Worker* or some of its readers tell me how to make a peppermint test on an old job of plumbing?

Note.—We hope some of our readers will describe in detail their method of making a peppermint test. In order that our correspondent may have a guide we give the following suggestions for a course of procedure. Care should be taken to see that all the traps are sealed with water, that the fresh air inlet at the house trap is stopped, and, if there is more than one vent pipe coming through the roof, that all are stopped but one. The windows and doors in the house must be closed. If possible it is better that the test should be made by two persons, one being on the inside of the house and the other on the outside. The one on the outside must be provided with 2 ounces or more of oil of peppermint, according to the size of the house, and a bucket full of hot water. After pouring the oil of peppermint down the open vent pipe at the top of the house pour the hot water in on top of it to insure the peppermint being washed down through the drainage system. As the oil of peppermint has a very pungent odor the smell will be readily detected if there are any unsealed traps or breaks in the piping or joints. If the test is performed by two persons, so that the one who pours the oil of peppermint can stay on the outside of the house, there will be no danger of the smell being carried into the building. The person on the inside who is to look for the leak must carefully search the pipes in one room before passing to the next and in that way satisfy himself either that there is no leak or else discover the location of the leak.

Folding Camp Equipments.

From H. A. S., Grangerville, Idaho.—I would like to have some of the readers of *The Metal Worker* inform me how to make a folding reflector, or bake oven, and also how to make a folding camp stove.

Two Pumps on one Pipe.

From W. K., Passaic, N. J.—Will *The Metal Worker* or some of its readers advise me what to do under such conditions as those shown in the cut? A is a pump in the yard, 11 feet distant from the pump B, in the kitchen, and which stands 18 inches higher than A. Should a check valve be placed on the suction pipe to B, at the point marked C?

Answer.—In *The Metal Worker* of June 10, 1893, this subject was discussed and an illustration was shown of a charging chamber for a pump when more than one pump was connected to the suction pipe. This charging chamber was of heavy iron, so that it would not readily collapse, and in size was made about four times as long as its diameter. In connecting the pumps with

it the suction pipe from the pump connected with the bottom of the chamber and the suction pipe from the well connected at the top of the chamber. It was considered that several pumps might be connected with such a chamber. A branch connection similar to that our correspondent proposes was also mentioned. If successful, however, it would be necessary for the valves in the pump to be absolutely tight and to continue so. If a valve in one of the pumps should leak it would interfere with the operation of the other pump, and this risk must always be taken into consideration. As there would only be a slight additional expense attached to running the suction pump down into the well, the certainty of success would more than repay it. The pumps will work connected as

Two Pumps on One Pipe.

shown, as long as all the valves are perfectly tight. A foot valve should be used on the bottom of the suction pump.

Repairing Gasoline Stoves.

From W. E. H., Philadelphia.—Answering "L. R. B." in *The Metal Worker* of April 13, the trouble mentioned with the New Process gasoline stove would be due to heavy or impure gasoline, caused either by having gasoline in a can which had previously been used for kerosene or by the dealer furnishing the impure article. The use of this grade of gasoline will cause the needle points to become gummed up with the heavy substance in the fluid. This will cause the gasoline to drop unevenly, and at times to momentarily stop dropping altogether. The flame will then die out, and when the gasoline cuts the accumulation of gum at the needle point it will again drop, but the vapor, instead of being consumed, passes off unconsumed and causes a disagreeable odor. We have had tanks sent to us to repair in which we found a sediment similar to linseed oil, which, of course, made the tank entirely worthless. The lack of operation of seven out of ten stoves can be traced to dirt or sediment produced as above. New Process gasoline stoves need to be kept religiously clean.

From C. A. W., Chicago, Ohio.—In answer to "L. R. B." whose inquiry appears in *The Metal Worker* of April 13, would say that he should take the cap from under the burner and take the center tube out and put new asbestos strips in the bottom of the burners. Also see that the sub burners are clean and put all back tight and pack the top plate with asbestos. I think by so doing his stove will be all right, as I clean a great many of them and have no trouble.

Joints in Green House Piping.

From SAMUEL A. HEINS, Rondout, N. Y.—In answer to "Y" in *The Metal Worker*, April 6, who wants to know how to make joints for cast iron pipe, would say that I have had some experience in piping conservatories with both cast iron pipe and wrought iron pipe, and I know that there are different ways of making joints or connecting cast iron pipes. I have made them several ways. One way would be with iron filings and sal ammoniac, taking a layer of jute packing and tallowing it well and driving it in the hub a little; then put in wet iron filings and pulverized sal ammoniac. Another way would be to use the jute packing in the same way and make a stiff paste of red lead ground in oil and mixed with litharge until it becomes like paste and insert it in the hub; and still another way would be to use the jute packing and the best Portland cement, and the last way would be to use a cement that I manufacture. I have found it to be the best cement for all cast iron joints; it will get as hard as iron itself in from three to five hours. If "Y" has never fitted up a conservatory it would be best for him to consult some person who knows something about that kind of work to make it work satisfactorily.

From T. C., Boston.—In answer to "Y." in *The Metal Worker* April 6, I have had the direction of work where rust and other joints have been made in cast iron pipe for hot water apparatus. These joints have been made of about eight parts of iron filings to one part of sal ammoniac, with sufficient water to moisten the whole. To make these joints a small quantity of oakum is put into the hub to stop the mixture from passing into the pipe. Then the hub is filled and calked in layers until the hub is full; this kind of joint, when properly made, will harden quickly. The so-called red lead joints are made by taking white lead that is ground in oil and adding red lead to make it of the proper consistency. Then oakum that has had a small quantity of boiled oil mixed with it is put into the hub to stop the lead mixture from getting into the pipe, and afterward the hub is filled with alternate layers of lead and oiled oakum. To fill and make a solid joint each alternate layer must be properly calked, and if properly made such joints will be good ones, but I cannot say which of the two is the best. The lead joints take more time to harden than the rust joints do. Formerly, when sulphur was used with the filings, &c., in the proportion of eight parts of iron, one of sal ammoniac and two of sulphur, the joints would burst the hubs of the pipes sometimes, and that caused such joints to be discarded. But when the sulphur is omitted rust joints are good and can be depended upon.

Elbow in Tapering Pipe.

From F. W. M., Baltimore, Md.—Will the Editor or some of the readers of *The Metal Worker* be kind enough to show me how to cut the patterns for a tapering square elbow in six pieces?

Answer.—If our correspondent will refer to "The Metal Worker Pattern Book," page 129, he will see there a solution for a three piece tapering elbow which embodies all the principles necessary for the solution of the other problem. Some time ago there was also printed in *The Metal Worker*, we believe, the patterns for a six-piece tapering elbow which will come nearer to our correspondent's wishes. We cannot, however, recall the exact date of the article in question. If any of our readers would like to present a solution of this problem for our correspondent we shall be glad to publish it.

Making Fire Pot Coil.

From E. G., Delaware.—I wish to put a coil of 1-inch pipe inside of a fire pot of an egg cylinder stove. The fire pot is made in two sections bolted together, and is 14 inches in diameter at the largest point. I want the coil to go around the fire pot three times. How shall I proceed to make the coil? I shall drill the upper and lower sections for the flow and return connections to the coil.

Note.—It seems practicable for such a coil to be made in the average shop, and we have no doubt but some of our readers have done it, and we hope they will describe their method.

Holes in Copper Tank Lining.

From COPPER, Chicago.—As the tank referred to by "R. R.," Hope Valley, R. I., has been in use 20 years, it would be difficult to find out just how the tinning was done. It is presumed that soldering acid and sal ammoniac were used in the operation of tinning, and as they are "strong medicines" they may have caused the copper to corrode. By using nothing but rosin as a flux for tinning copper the corrosive action of the "medicines" is avoided.

Paste for Asbestos Paper.

From C. A. W., Chicago, Ohio.—In reply to the inquiry of J. Callaghan & Sons, asking for the best method of fastening asbestos paper on hot air pipes, I soak the paper in a tub and have a fire in the furnace so the pipes are hot. I have never yet had any come loose. I use a brush to make it smooth and am careful that there is no air between the paper and pipe. Put on in this way it will shrink very tight and be faster than it would be if pasted.

From O. B. G. Bridgeton, N. J.—I notice in *The Metal Worker* Letter Box of April 6 J. Callaghan & Sons ask for information about a paste for asbestos paper. I think the best and cheapest way in wrapping hot air pipe with asbestos paper is to fasten it on with stove pipe wire. Put a piece around each end and in the middle and 8 or 10 inches apart. A pair of small snips or pliers that can be carried in the pocket is very handy for taking down this work. Whenever it is necessary to take

down one of these pieces to clean it simply snap the wires and the paper is off, whereas if it is pasted on there will be a loss of time, patience and paper. I know, for I have been there. I haven't pasted any now this seven years and am always thankful that I have not done it.

A Balky Furnace.

From J. H. W., Bridgeport, Conn.—I have seen considerable discussion in the columns of *The Metal Worker* lately relative to a peculiar furnace experience. While the readers are in a corresponding mood I would like to get from them some advice and a remedy for the bad operation of a balky furnace. I give a sketch of the house, which stands exposed in the country, on high ground, with nothing to break the force of the wind. The house faces the southwest.

A Balky Furnace.

It contains ten rooms, which average 12 x 15 feet, with 9 foot ceilings, excepting the parlor, which is 18 feet long. The sketch shows only the lower floor, but it will serve to represent the second floor also, as the arrangement is very similar. The location of the heater, which is simply large, cannot be changed owing to the basement and its uses. It is set over a brick pit, the cold air being conveyed to it through a trench under the cellar bottom. There is no difficulty experienced in heating the house, no matter how cold it is, except in windy weather; but with a stiff west or northwest wind blowing, the registers in parlor, hall and library will be cold, and although a strong fire is maintained it is difficult to get heat through the pipes to these rooms. When the wind is north or east the house is sufficiently warm and the heater behaves all right. The question is, what can be done to overcome this difficulty? How can the piping be arranged or the rooms be ventilated so that the hot air will flow to them in sufficient volume, as it does in still weather? Will some of the experienced furnacemen kindly state what can be done to bring about the desired result on the first floor?

could tell me what these drops or streaks are caused by.

A Dispute as to Sizes.

From C. M. F., Tennessee.—One of our customers ordered some pans to be made. The order read: "Two top pans, 48 x 16 inches, 2 inches deep; two bottom pans, same depth as top pans, 23 inches larger each way." We made the bottom pans 50½ x 18½ inches and he claims we should have made them 53 x 21 inches. Which is right?

Note.—According to the reading of the order as furnished by our correspondent we think that he was right in making the pans altogether 2½ inches longer and 2½ inches wider. His customer evidently had the idea that the measurements would be taken from the center of the pan and that 2½ inches larger each way would then mean 5 inches longer and 5 inches wider. But we do not think that the ordinary sheet metal worker would so interpret the order.

Cleats for Tin Roof.

From APPRENTICE, Boston.—Will some of the many readers of *The Metal Worker* who are skilled in the art of laying tin roofs kindly inform me the number and location of cleats required when laying a flat seam tin roof with 14 x 20 or 20 x 28 tin. What method gives the most satisfactory results, nailing through the tin, or by using cleats?

Trouble With Rinsing Tank.

From A. W., Perryville, Mo.—I would like to have some help in a difficulty I have had with a barkeeper's rinsing tank. It is lined with galvanized iron and well water is used in it. The drops of water which dry on the glasses after rinsing leave dirty spots or streaks. I wish some of the readers

PLUMBING and GAS FITTING.

Denver Plumbers.

At the second meeting of the Master Plumbers' Association 47 members were present, 16 absent. The secretary's report of the year's business was read and approved. The retiring officers each received congratulations for his good work. The following directors were appointed: P. H. Balfe, George E. Smith, James Shannon, Archie Davis and Curtis Mann. The officers elected for the ensuing year are: George E. Smith, president; P. H. Balfe, vice-president; James Shannon, treasurer; Archie Davis, secretary.

After the new officers took their positions a surprise was given the retiring officers. The late secretary, Chris Irving, was presented with a handsome gold watch and chain. The treasurer, James Shannon, received a silver tea set, and ex-President Daniel Frey got a gold-headed cane, and also a handsomely mounted walking stick of artistic make was presented to James Johnson for his excellent services as secretary in the State Board of Plumbing Examiners. After the recipients, each in turn, had made appropriate speeches all the members adjourned to more commodious quarters and celebrated the event with song and story.

Sanitary Fixtures.

The waste of water in plumbing fixtures used in public buildings has led to a demand for apparatus which will

is designed for use in private residences and suites of apartments in hotels, where some objection has been found to

requirements. It is made in different kinds of wood and different grades of ornamentation and is adapted for a

Wash Down Closet with Hidden Tank.

the open wood work and the exposed earthenware closets so generally in use. This closet is finished as a handsome

wide use. Fig. 2 shows the Weeden waste preventing urinal, which, it is claimed, wastes no water, as it is only flushed when in use and that the flushing continues only as long as used. A siphonic action is caused which brings a liberal flush of water down the flush pipe and thoroughly scours the entire internal surface. An automatic flush tank flushes continuously at fixed periods, whether in use or not, wasting a great deal of water. Where water meters are in use it is claimed that a reduction in the water bill is certain to follow the use of this fixture. It is also claimed that these urinals will keep sweet and clean without the use of camphor, carbolic soap and other disinfectants.

Wash Down Closet with Hidden Tank.

A water closet specially adapted for use in public places is shown in the accompanying illustration and is made by the Dalton-Ingersoll Company, 169-175 High street, Boston, Mass. It is of the wash down type and is arranged with a low down flush tank operated by a lever. With this closet a large number may be placed back to bank in a comparatively small place and the flush tank, soil pipe and all of the apparatus placed in an inclosed space between the two rows of closets, to which access may be gained by means of a door conveniently located. This arrangement is said to be valuable for the opportunity which it offers for getting at clean out openings in the soil pipe or making general repairs without marring or disturbing any of the exposed fixtures. The closet is also made to be operated by seat action. It is said that local ventilation can be

Sanitary Fixtures.—Fig. 1.—The Aida or Chair Closet.

overcome the trouble, and our illustrations show some new goods for this purpose recently put on the market by Henry C. Weeden, Boston, Mass. Fig. 1 shows the Aida or chair closet, which

chair, and the flush tank may be located above it, as shown, or in an adjacent room, so that all appearance of a water closet is removed. It is said that the closet meets the most rigid sanitary

Fig. 2.—Waste Preventing Urinal.

obtained by boring a hole in the tank cover and inserting the vent pipe in it so that the end does not project below the lower surface of the cover.

Wade's Delaware Basins.

The demand for sanitary fixtures of attractive appearance has brought out many lavatories which have a secret waste and overflow. In our illustration

ited the Quebec master plumbers on Monday, April 8, where they attended a large meeting composed of the members of leading firms. Spirited addresses were made and general enthusiasm was the order of the day, and before the meeting broke up it was resolved to form a master plumbers' association for Quebec City in affiliation with that of Montreal and working under the same act of incorporation. A meeting will

Wade's Delaware Basins.—Fig. 1.—Showing Secret Waste Valve.

we show the Delaware basin made by J. J. Wade & Son, 276 Dearborn street, Chicago. These basins have the overflow pipe made as a part of them, and being of glazed earthen ware they cannot corrode and afford no opportunity for filth to cling to the sides. As shown in Fig. 1, the waste is controlled by a secret valve operated by an ornamental handle which is set in the top of the

basin. The valve is so constructed that it may be readily removed, the overflow then being freely accessible and easily cleaned. Fig. 2 shows the same basin arranged so that a flush jet may be attached to the overflow for thoroughly scouring and cleansing the overflow and trap.

Fig. 2.—Showing Flushing Jet.

basin slab. The valve is so constructed that it may be readily removed, the overflow then being freely accessible and easily cleaned. Fig. 2 shows the same basin arranged so that a flush jet may be attached to the overflow for thoroughly scouring and cleansing the overflow and trap.

Dominion Master Plumbers.

We learn that the Master Plumbers' Association of Montreal and vicinity is progressing. A delegation consisting of J. Lamarche, president, and J. W. Hughes, corresponding secretary, vis-

association will be to agitate for such a law. We have no doubt the best citizens of the city will heartily co-operate with the master plumbers in this work. The object sought is a very desirable one, affecting the community very closely. The Toronto Association is also in vigorous working order and steps are being taken to form associations in all cities of the west as well as those in the Maritime provinces. We believe it is the desire of the Canadian associations to affiliate with the National Master Plumbers' Association of the United States.

Will Construct Roman Baths.

Plans have been completed for the remodeling of the old Commercial Hotel, Lake and Dearborn streets, Chicago, by the Chicago Roman Bath & Hotel Company, which have taken a lease on the property. The basement and first and second stories will be fitted up as a bath establishment, with hot and cold swimming pools for men and women and with office and restaurant for the hotel.

The main corridors and office of the first story will have mosaic floors, marble stairs and ceiling, and marble stairs leading to the upper floors. The Lake street front of the building will be occupied by three stores and the hotel entrance, the remainder of the first floor being devoted to the bathing establishment. This will be patterned after the Vienna baths and will be in imitation of the baths of Caracalla, in ancient Rome. There will be separate entrances and baths for men and women, consisting of warm and cold plunges, Russian, Turkish and electric, and a large cold swimming bath. These rooms will be fitted up with marble, scagliola and Pompeian decoration. The swimming baths will be lined with marble and tile. The floors will be of mosaic and the walls wainscoted with marble, with columns, pilasters and arches of polished foreign marble. Over the wainscoting will be Pompeian decorations in the style of the Roman baths of Pompeii. These baths will be illuminated in daytime with skylight and colored glass ceiling lights. All the minor baths will be finished in marble. Around the bathing establishment will be sleeping rooms finished entirely in cement plaster, with marble floors and ceilings, and perfectly ventilated. Above the baths will be two stories devoted to sleeping rooms to be used in connection with the bathing rooms.

The bath portion will be heated and ventilated with hot air apparatus; fans and heating coils will be located in the basement and hot air will be forced into the various rooms. These will be thoroughly ventilated through ducts carried up to the roof, and a constant supply of warm air will be supplied to other portions of the bathing establishment. In the basement will be a series of special bathrooms. The bathroom portion will be lighted at night with arc and incandescent lights. The ceilings of the various bathrooms will be paneled, groined and arched, giving the effect of the old Roman baths.

TRAPS AND VENTS.

GROUND WAS BROKEN in New York City last week for a garbage crematory that is to occupy a vacant lot at the foot of East Third street. It is merely a trial plant, costing about \$7000.

AMONG recent incorporations at Albany, N. Y., is the Sewer Pipe Supply Company of Buffalo, organized to deal in sewer pipe, flue linings and cement. The directors are Alfred Lyth, Nathaniel Barnum and William F. Dunsbaugh of Buffalo.

MAYOR SHORTLIFFE of Wilmington, Del., has written a letter to the Mayor of New York, giving details in regard to the system of garbage disposal in operation in his city. He claims that, by the plan in use in Wilmington, the problem of the sanitary disposal of garbage has been successfully solved. After a year's trial their crematory has proved itself perfectly satisfactory,

nearly 9000 tons of garbage having been destroyed last year, besides horses, dogs and other animals. The cost of destruction was very reasonable, not exceeding five cents *per capita* per annum, computing interest on plant and cost of maintenance. The Wilmington Board of Health, moreover, reports that since the crematory has been in existence there has been a decrease in deaths from zymotic diseases of nearly 8 per cent. over the preceding years.

THE VULCAN COMPANY, 315 Madison avenue, New York, are putting on the market a plumbers' fire pot of a new type, using gasoline as a fuel. It is made of heavy sheet iron and is a cylinder about 8 inches in diameter and 15 inches high, perforated at the bottom to prevent the floor on which it is set becoming heated. At the top is a device for suspending a plumbers' metal pot. In one side is an opening through which the burner or torch is inserted. It is claimed that the torch will hold sufficient fuel to last three or four hours, and that it will keep 10 or 12 pounds of metal in the proper liquid condition during the whole time, melting this amount of solder or lead in about 12 minutes. The torch used embodies the same principle as their Vulcan hand torch, and may be removed from the fire pot and used as a torch when desired. An opening is also provided for heating the solder coppers.

A LITTLE PAMPHLET is issued by the Star Coupler Company, St. Louis, Mo., giving a number of testimonial letters from prominent users in favor of the Star lead pipe couplers. These testimonials, all of recent date, speak in very high terms of this device.

ALDERMAN POWERS, St. Joseph, Mo., is endeavoring to have an ordinance passed to provide for the inspection of plumbing in that city.

WILLIAM FAUST has removed his plumbing shop to George Neilson's old stand, under Gilroy's clothing store, Pittston, Pa.

THE plumbing firm of Bohlman & Place, Burbank street, Pittsfield, Mass., have been dissolved, and Mr. Place is to take a position as superintendent for Mr. Bohlman, who will continue the business.

WILLIAM MAUS, Butte City, Mon., has decided to open up a plumbing establishment for himself.

WM. R. DODGE has bought out the plumbing business of T. F. McCormick, 6 Mill street, Newport, R. I., and has engaged Mr. McCormick as an assistant.

MAYOR KINGSLEY, Rome, N. Y., filed the appointment of Fred. S. Russ as a member of the Board of Plumbers in the place of John P. Cook, resigned.

THE MANKATO PLUMBING COMPANY, have been organized at Mankato, Minn., and bought out Sullivan & Co. The new firm comprise the members of the old firm and some new blood. Ed. I. P. Staede was elected manager of the new company.

GEORGE BADLEY of Tama, Iowa, and R. M. Rochford of Toledo, Iowa, have formed a partnership in the plumbing business. They will continue to have shops in each town.

THE following plumbing establishments have been recently established in Chicago: Jas. H. Mullen, 368 East Sixty-third street; Condon Bros., 47 Canalport avenue; S. C. McGraw, 2393 116th street; William J. Dermody, 480 Ogden

avenue; James McCarthy & Co., Palace Hotel, Windsor Park; A. J. Fisher, 1036 Irving Park boulevard; Walker & Williams, 4219 State street; J. G. Schriener, 556 Sacramento avenue; Jacob A. Spies, 729 Southport avenue.

THOMAS F. BURNS has opened a plumbing, steam and gas fitting shop at Norwich, Conn., and is a new candidate for trade literature.

D. R. KENNEDY, Ware, Mass., has gone into the plumbing and roofing business on his own account and has opened a shop in the basement under Barnes & Packard's market.

HERBERT M. SAUNDERS, Rochester, N. Y., has been appointed a member of the Examining Board of Plumbing, in place of Louis F. Zimmer, who recently resigned from the position.

THE PLUMBING BOARD of Rome, N. Y., has elected C. H. Jackson president and F. M. Shelley clerk. The members of the board receive \$60 each per year and the clerk \$100.

WILLIAM H. CURTIN, formerly with the James W. Birkett Mfg. Company, has started in business for himself in

tember which should receive attention from our manufacturers. The city of Paris will shortly reconstruct its entire sanitary system. New drains are to be put in on 900 streets, and owners of houses will be required to make connections in the most approved modern methods. The exhibition is to be held for the purpose of educating the people on this important subject.

THE GRAND JUNCTION PLUMBING COMPANY, composed of S. F. Goss, G. D. Hawkins and J. L. Hawkins, Jr., have engaged in business at Grand Junction, Col.

HINCKLEY BROS. & WEEKS have moved their tin and plumbing shop to the basement of the Smith Block, Barre, Mass., and in the first floor of the building they will place for sale a large assortment of stoves, ranges and tinware.

The Portable Radiator.

The illustration herewith shows the portable radiator made by the Illinois Safety Heater Company, St. Charles,

The Portable Radiator.

plumbing, steam and hot water fitting and supplies at 161 Flatbush avenue, Brooklyn, N. Y.

THOMAS W. MULLIGAN and MELVIN M. HYATT have entered into a partnership under the firm name of T. W. Mulligan & Co., to carry on a general business as plumbers, steam and gas fitters. Their shop and warehouses are located at 8 Hodge Opera House, Lockport, N. Y.

THE SENTIMENT of Chicago journeymen plumbers appears to be opposed to the admission of apprentices to shops in which they are employed. In this sentiment the juniors or helpers join. It is very probable that the workmen's organizations will adopt resolutions that the ranks of the journeymen shall be recruited solely from the junior plumbers.

S. E. YOUNG, who has for 23 years been connected with E. Baggot of Chicago, will sever his connection about the middle of May to assume the management of a plumbers' supply house now being organized and which is to be started June 1. As a testimonial of the esteem with which Mr. Young is regarded by those having intimate relations with him, 13 of his fellow employees, on April 13, presented him with a valuable gold watch. The coincidence in the number and date may be taken as a happy omen of his career. Announcement will be made in due season of the name and location of the new supply house.

AN EXHIBITION of sanitary appliances is to be held in Paris from May to Sep-

Ill., which is designed to use either gas from the city supply or gasoline gas made by their generating apparatus. The device consists of a water heating apparatus with an opening at the top and bottom for connecting with any ordinary radiator. The radiator and heater is arranged on casters so as to be moved where the heat is desired and connection can be made with the gas supply in the most convenient manner.

The sensational advance in the price of mineral oil has continued during the past week. On Thursday petroleum quotations, which a month ago ruled at \$1 per barrel in the New York market, reached \$2.70 per barrel. The boom in this product has caused great excitement in the Pennsylvania and Ohio oil regions, where every available well is being worked to its fullest extent. Old wells which have been closed for years are being redrilled. The district is said to be flooded with speculators, who are snapping up all the land obtainable with the view of driving new wells and are offering fabulous royalties for good producing territory.

We have received a letter from Charles B. Howe, secretary, Fort Deposit, Md., stating that the next annual meeting of the Manual Training Teachers' Association of America will be held at the Armour Institute, Chicago, Ill., on July 16, 17 and 18 of the present year.

Hall's Improved Pipe Wrench.

The accompanying illustrations relate to an improved form of pipe

Fig. 1.—Hall's Improved Pipe Wrench.

wrench, put on the market by Samuel Hall's Son, 229 West Tenth street, New York. The wrench is described as being drop forged from crucible steel,

which are given in Figs. 4 and 5, is used in connection with the wrench for gripping very thin or highly polished brass or nickel plated pipe or tubing,

Fig. 2.—As a Screw Wrench.

having hardened upper and lower jaws, with all parts made to standard gauges and interchangeable. The jaws are smooth instead of being corrugated, to

so as not to mar or crush it. The clamp is made of cast iron, lined with an elastic rubber lining $\frac{1}{8}$ inch thick, so as to conform to any irregularity of size

Fig. 3.—Method of Sharpening.

prevent nuts or highly polished fittings being marred, and there are no springs used in its construction. It is explained that if the gripping point of the wrench,

Fig. 4.—End View of Elastic Pipe Clamp.

as in Fig. 1, be placed so as to correspond with the size of the pipe as marked on the side of the hook, little, if any, further adjustment is required; also that the wrench is quickly adjusted to different sizes and to all kinds of pipe, including galvanized, which it grips quickly and firmly; that the wrench will not crush pipe; that it re-

leases instantly, and that it cannot lock on pipe. When used as a screw wrench, as shown in Fig. 2, it is stated that it will grip a nut or bolt so that it cannot slip, and that the jaws being on an angle have the advantages of an S wrench. It is pointed out that the wrench may be sharpened upon a grindstone or emery wheel without being taken apart, as in Fig. 3, this feature being emphasized by the manufacturer. An elastic pipe clamp, views of

It is remarked, for large nuts and bolts as well as for pipe work; also that the 36 inch wrench will take a nut suit-

Fig. 5.—Side View of Elastic Pipe Clamp.

able for a 3 inch bolt, and the 48-inch wrench will take a nut suitable for a 4 inch bolt.

The illustrated catalogue and price-list issued by the Hanson & Van Winkle Company, Newark, N. J., with New York office at 81 Liberty street, and Chicago office at 85 and 37 So. Canal street, is a book that will be of interest and service to the increasing number of those who have to do with electro plating. The earlier pages show interior views of electro plating rooms fitted with the Hanson & Van Winkle apparatus. The introductory note to the trade is of particular interest, and gives the early history of electro plating and their connection with it. The closing paragraph reads as follows: "While it is impossible to prevent imitation of our goods or catalogues by unscrupulous competitors, we cannot help calling the attention of the trade to the lowest form of competition by which discounts and commissions which properly belong to the consumer are used to debauch employees and lead to the wasteful use of second rate material." The first electro plating machine, built by Woolrich in 1844, is shown in the earlier pages, and is an interesting relic. Then come illustrations, with particulars of the H. & V. W. dynamo and electro plating machines; also the H. & V. W. switch board or rheostat, voltmeters and ammeters following. A number of goods are listed which include all that is necessary for different sizes of plating outfits. Polishing and buffing machinery follow, a variety of lathes being illustrated, described and priced. Grinding machines come next, then polishing wheels of all sorts, polishing material, plater's supplies, including glassware, &c. The next division of the book relates to lacquers of various sorts which Hanson & Van Winkle Company furnish. Directions are given and particulars of the different sorts of lacquers as well as supplies for this work. Electric batteries are noted later; then come electric light machines, storage batteries, telephones and other forms of polishing lathes. Interesting tables are given at the end of the book, which closes with an alphabetical index.

The Canadian Trade Review says that, out of 55,000 families in Montreal, only one in five uses gas. The reason given is that the price of the illuminant is maintained at such a figure as to be practically prohibitive, except in the case of the wealthier classes.

The American Line steamship "St. Paul" was successfully launched at Cramps' shipyard, Philadelphia, on the afternoon of April 10, in the presence of a very large concourse of people.

STEAM AND HOT WATER.

The Harvard Radiator.

Herewith is an illustration of the Harvard radiator, which has just been placed upon the market by the Gurney Heater Mfg. Company, Boston, Mass. It is made for hot water or steam heating, top connections being used in both instances, in four heights, as follows: 39, 33, 27 and 21 inches. In bringing it to the attention of the trade, the manufacturers desire to state that the decoration is entirely new and of very artistic design. This radiator has been constructed with a view of allowing ample space for the circulation of air, thus insuring the greatest efficiency. The manufacturers allude to the small amount of floor space occupied, the uniform thickness of the castings, the fine quality of iron, and mention that each section is put together with a push taper nipple made of 2-inch steel pipe. The Gurney Heater Mfg. Company desire to emphasize the fact that they guarantee the amount of radiating surface to be as catalogued. The Harvard (for hot water) contains practically the same water volume as the Gurney hot water radiator, viz., 13½ gallons per 100 square feet. The manufacturers will be very glad to quote prices and furnish descriptive circular upon receipt of request.

The Proper Location of Radiators.

BY W. H. PENNELL, WASHINGTON, D. C.

Experiments for determining the value of radiant heat began with a red hot ball suspended freely in the air. The results of these experiments determine the fact that heat travels in straight lines, but that the effects of radiant heat are more noticeable above than in any other direction. This we recognize as "of course," without, perhaps, recognizing the fact that it is the currents of heated air rising, because heated, that makes the result noticeable. Experiments show that heat rays may pass through air without heating it, as the heat rays of the sun pass through our atmosphere. This has led some to contend that pure dry air is transparent to heat. This may or may not be so, but our experiments with heating houses must take into account the convection of heat by the air or the impurities in the air, for by some medium we must convey heat to every portion of a room from the place where we locate our radiator. The radiator may be a stove, a glowing grate, red hot ball or a reservoir filled with steam or hot water.

A stove throws out or radiates heat laterally as well as upward, so that the room seems to be heated from the heat rays thus sent off, for these rays are so strong that they quite take away the idea of the air becoming heated and the room being heated by the circulation of the air. When the air absorbs heat—becomes heated—it expands and rises very rapidly. The cause of the upward rush of the air being the heat absorbed, it is evident that the air will continue to rise as long as the amount of heat is constant. The heat from a column of

heated air is absorbed or extracted slowly by the surrounding cold air, but when a solid body is encountered the heat is very rapidly discharged. As the air loses its heat it is condensed, and becoming heavier it will fall toward the floor. The pouring of water from a vessel upon an iron plate from a considerable height will illustrate inversely the action of the air pouring out of a furnace register up through the air of a room until it strikes the ceiling.

As the water would flow away toward the lower portion of the plate so the air flows away toward the colder

Radiant heat is noticed most strongly from the stove and least from the hot water radiator. In fact, in moderate weather, when the water in the boiler is not over 100°, no radiant heat is recognized, horizontally, from a hot water radiator. The currents of air coming in contact with the heated iron seems to carry all the heat in vertical lines. Because this is so we will take the hot water radiator to determine the proper place in the room for the radiator to best heat the room. It is evident that the air of the room must be warmed, and with it the walls of the room, the

The Harvard Radiator.

wall more rapidly than in the other direction. As it flows along the ceiling, followed constantly by the renewed current, parting with its heat all the time, it seems drawn toward the colder portion more rapidly, so that if there is an exposed wall or a window the currents will be found to be most rapid in that direction. A simple experiment will determine this. Place a bit of aromatic gum, or any strong smelling tincture upon the register of a hot air furnace and notice how much more quickly you will get the odor at a window than in any other part of the room.

When the heating apparatus is in the room to be warmed, whether it be a stove, a steam radiator or hot water radiator, the air is warmed by contact with the heater.

furniture and all solid matter of whatever nature in the room, all to an equable temperature. What this temperature will be must be determined by the size of the radiator and temperature of the water. That is, proportion of heating surface to cubic contents plus temperature of water in radiator.

The moment the water is heated the air in contact will rise at once from every part of the heating surface, being supplied from below by the colder air flowing in to take the place of that sent up toward the ceiling. The upward stream being constant the flow toward the radiator must be equally constant, and the current toward the radiator will be the colder air, that near the floor the coldest, so that the very coldest place in the room will be at the floor near the radiator.

We have seen that the air rises constantly to the ceiling, flows along the ceiling, parting with a portion of its heat down the walls to supply the current that is all the time flowing toward the radiator, parting with the heat by contact with the walls, falling the more rapidly the more it is cooled, and most rapidly down the colder walls. Glass is transparent to heat, and so down past the windows the current flows most rapidly, but as the current is drawn most strongly toward the window a larger portion of the heated air is drawn in that direction, and therefore a larger quantity of heat will be carried to the floor, where, parting with still another portion of heat, the air will flow toward the radiator, to be again heated and sent into circulation. This should make the floor near the window the warm place, if the radiator is placed where it should be, upon the opposite side from the window. A careful study of the subject will convince one that the proper place for a radiator in a room is not under a window. No one would think of placing a stove in a bay window "to make it comfortable to sit in," and yet we find some who will place radiators where they would not put a stove. I have seen radiators set into a recess, with a screen in front under a window cutting off all circulation of air.

Radiators improperly set are costly fixtures, since they use up fuel without giving an equivalent. When all the conditions are observed there is no system so economical as hot water heating; but it is more essential with this that the radiator should be properly located. We are told that one can feel the cold near a window. Our bodies become radiators when we are near a colder body, and we feel the loss of heat abstracted by the window. If the room is sufficiently heated, so that the current down the window will bring with it a surplus of heated air, this loss of heat from our bodies will not be perceptible. This whole matter is easily decided by experiment, and an unprejudiced examination will show that these conclusions are correct.

Richmond No. 336 Sectional Heater.

We present herewith illustrations of a new steam and hot water heater recently patented by W. C. Higgins of Norwich, Conn., which the Richmond Stove Company are about to offer in the market. It will be known as "Richmond No. 336 Sectional Heater." While the boiler has many features similar to those of present constructions made by this company, it will have also entirely new ones, which, they say, will appear for the first time in sectional boilers, and it is claimed will mark an advance forward in this type. Among these features will be the form of the leg, affording a natural channel for the return water in a steam boiler; the large direct fire surface within the combustion chamber, and therefore exposed to the direct action of the fire; the double return flues of large areas, permitting the products of combustion to pass through the boiler to their exit in the chimney in combined form, and thus performing their full service; the extended dome, or steam chamber of the sections, at the water line of a steam boiler, thereby increasing the liberating surface for steam and securing a more steady water line. The base or ash pit is built of brick, having an 8 inch wall surmounted by a 4 inch, on which will rest the bed plate to re-

ceive the sections as they shall be mounted in their places. Provision will be made for an ash pit of 16 inches deep, which may be increased to

seen that they are made in halves. This will facilitate the handling of the parts in assembling them, on account of what otherwise would have been

Richmond No. 336 Sectional Heater.—Fig. 1.—Different Sections of the Heater.

meet the further requirements of the contractor. The grates are single bars of triangular form, which experience, it

their cumbersomeness and weight. The illustration affords suggestions of the mounting of the boiler, showing the

Fig. 2.—Sectional View of Ten-Section Heater.

is said, has demonstrated to be most durable and economical in use. Fig. 1 represents the different sections forming the complete heater. It will be

connections at the top of the two halves with the flow drum, which, with the two return drums, will bring the different sections into union as a complete

boiler. These connections will be made with 2-inch extra heavy wrought iron nipples, with lock nut joints. Fig. 2 is a sectional view of a ten-section heater and shows the fire surfaces within the combustion chamber, as

thus pass regularly and evenly over the shell of the boiler until drawn into the smoke flue. The deflecting shields are movable by means of a lever extending to the outside of the casing, a movement of which lever creates a

is said to increase the rapidity of circulation from 25 to 35 per cent. It is also said that the taking of the water from the boiler from the coldest point,

Fig. 3.—General View of Heater.

well as the order and direction of its flues.

Fig. 3 represents the complete steam boiler. It is claimed that the Richmond will be equally well adapted for hot water. The function of the two—i. e., steam and hot water heaters—in relation to their connecting systems and uses, is the same—that is, to heat the water. The No. 336 Richmond is intended for large work, having a fire pot 36 inches wide and from 41 to 55 inches long, according to the number of its sections. It will be made in five sizes, having grate surfaces from 1476 to 1980 square inches. Its claimed capacities for steam will be from 2100 to 3000 square feet of direct radiation, and for hot water from 3500 to 5500 square feet.

The Lindemuth New Sun Steam and Hot Water Heaters.

Broomell, Schmidt & Co., Ycrk, Pa., are putting on the market the New Sun steam and hot water heaters shown in the accompanying illustrations. As will be seen in Figs. 1 and 2 the heaters are of the vertical type. They are described as being constructed throughout of selected steel or iron plates, and the surfaces are divided in a manner calculated to give the best results. The division of the water spaces by heating surfaces in the fire and drop tubes is intended to effect positive circulation in all parts of the boiler. There is a combustion chamber above the fire box, affording ample space for the mixture of the gases and their combustion. The hot gases, after leaving the combustion chamber, pass around the drop tubes up the fire tubes, whence they are carried into a chamber where they are divided by deflecting shields meeting angle iron plates, and

direct or indirect draft, as may be required. The base is provided with an ash pit door of suitable size, to which is fitted a draft door. An anti-clinking opening covered with a mica door is situated above the ash pit door. The grate is of an improved anti-clinking rocking pattern, close enough to allow of the use of fine coal, and yet allowing sufficient space for the passage of air. The base is fitted with clean outs for the removal of soot or dirt collecting between the casing and the boiler proper.

The drop tubes are made of strong 2-inch pipe, securely welded at the

The Lindemuth New Sun Steam and Hot Water Heaters.—Fig. 1.—Broken View of Hot Water Heater.

bottom end and having on the inner part an insertion of 1/4-inch pipe set with cast iron projections and dividers. These tubes are designed to hang immediately over the fire and thus add to the efficiency of the circulation. The water is discharged immediately under the outtake of the hot water system, and

Fig. 2.—Section Through Hot Water Heater.

an objection heretofore encountered, is entirely obviated. The heaters are, however, when required, supplied without drop tubes.

Fig. 3 shows the position of the fire tubes and drop tubes. The under dome, as previously described, is divided by partitions which divert the products of combustion and turn them over the outside of the heater. This, it is claimed,

Fig. 3.—Section Showing Fire Tubes and Drop Tubes.

prevents the outer casing, or top of heater, from becoming overheated and radiating the heat. In the top of both inner and outer domes are placed hand hole plates to admit of cleaning or inspection of the tubes. The heater is incased in a heavy galvanized casing lined with a heavy sheet of asbestos in order to prevent radiation, and is supplied with an improved automatic damper regulator, draft door, draft check and damper, and all the usual fittings.

The steam boiler, in construction, is similar to the hot water heater. The boiler is said to contain sufficient water to fill the system with steam without necessitating filling until the water of condensation returns. The heating surfaces are described as being ample, and it is stated that steam is quickly raised and maintained with a small amount of fuel. It is claimed that the steam space is large and that the manner of taking steam out of the boiler through the funnel outtake prevents siphonage of the water under any circumstances.

Ideal Steam Boiler.

The Ideal Boiler Company, 36 Dearborn street, Chicago, herewith illustrate their steam boiler, which was put upon the market late last season, and so satisfactory was its performance during the severe weather which was experienced in all parts of the country during the winter of 1894 and 1895 that the manufacturers are claiming for it some strong features of superiority. Fig. 1 shows the boiler with casing partly removed and Fig. 2 shows a broken view of boiler. Many of the distinguishing features of the Ideal hot water heater are retained in the construction of their steam boiler. It is claimed that no feature of these boilers has at

manufacturers lay great stress. The Ideal steam boiler is arranged for direct draft through the sections and through the steam dome to the chimney; for indirect draft, by means of a damper, the products of combustion are diverted down the front side of the boiler, between the jacket and the sections, returning the same way up the back side of the boiler to the chimney. Every portion of the boiler is easily accessible for the purpose of cleaning. The aim of the manufacturers is to introduce as few parts as possible, and their boilers are so simple in construction that they are easily set up by those most inexperienced in the business. The capacities of the various sizes have been determined with great

is followed by cuts showing the construction and operation of the Andrus heater. The feature of the catalogue is in the bringing out of four new sizes of the heater, two of which are smaller than have been made heretofore and two of which are larger. They are rated to carry respectively 300, 375, 1600 and 1850 square feet of radiating surface. The heater is made in ten different sizes, and in capacity is adapted for large and small work. The last portion of the book is devoted to testimonials of the superior operation of the Andrus heater during the past winter.

THE BLACKMORE HEATING SUPPLY COMPANY are a new house at 101 Beekman street, New York, in the new Beekman building. They will have the Eastern agency for the line of Triumph hot air furnaces and combination heaters made by the Craig-Reynolds Foundry Company, Dayton, O., and for the Ormate radiators made by the United States Radiator Company,

Ideal Steam Boiler—Fig. 1.—Boiler with Casing Partly Removed.

Fig. 2.—Broken View of Boiler.

tracted so much attention or has tended to so enhance their popularity as the Push Nipple Joint which is used to connect the sections, and which, it is maintained, will last as long as the house in which the apparatus is erected will stand. The greatest care is exercised in reaming the sections and in grinding the nipples. All of the parts of the different sizes of heaters are made absolutely interchangeable, affording to the steam fitter the greatest facility in setting them up. Not a little difficulty is experienced with various kinds of house heating boilers for steam in maintaining a steady water line, and to overcome this there is introduced at the back of the boiler, as shown in Figs. 1 and 2, a large water way connecting the sections in which the water line is carried with the fire pot, but this water has no connection with the intermediate sections. This device secures a perfect circulation within the boiler itself and is a feature of excellence upon which the

care and with proper regard for their relations to the actual and effective fire surface in each. It is claimed that they are underrated rather than overrated, according to the accepted standards.

HEATING NOTES.

THE WILLIAMS HEATING COMPANY are a new house at 83 John street, New York, which will continue the business of constructing heating plants formerly carried on by the Blackmore Heating Company.

ABENDROTH BROS., 109-111 Beekman street, New York, are issuing a 20-page catalogue of the Andrus water heater in a maroon leatherette cover with their address on the front cover in gilt and their trade-mark in gilt on the back cover. In the introduction to the catalogue they point out the advantages of hot water as a means of heating. This

Salisbury, Pa. They handle a number of specialties of interest to the heating trades. L. R. Blackmore has recently returned from a trip in New England in the interest of the house.

W. S. NEWKIRK, well known in the steam and hot water heating trade, having been for many years with Eaton, Cole & Burnham and later with the A. A. Griffing Iron Company, has opened a New York office at 110 Beekman street for the United States Heater Company of Detroit, Mich., where he is advancing the interests of the Capitol, Hecla and Mascot heaters.

THE NEW YORK CENTRAL IRON WORKS, Geneva, N. Y., report that they are doing an excellent business and evidence of it is shown in some of the large shipments recently made of their famous Dunning boilers. One lot of 11 steam heating boilers was packed in a freight car to be sent to Helena, Mont., while a second shipment at the

same time was made to Washington. Two large individual contracts almost completed are a 100 horse-power boiler for the Seneca Woolen Mills and a 40 horse power boiler for Sigler & Co. of Geneva.

THE latest postal traveler of the United States Heater Company, Detroit, carries the announcement, "We sell radiators." Then it goes on to say what the special merits of these radiators are. Other goods that they sell are valves, expansion tanks, &c. The trade, of course, knows that they sell the Capitol, Hecla and Mascot heaters—that goes without saying.

SMITH & WINCHESTER, Boston, Mass., are making preparations to remove their New York office from 174 Fulton street to the Cornell Building, at 141 Centre street, May 1. Secretary N. E. Frost will look after the interests of their specialties in plumbers' supplies, and also the Winchester boiler, which he will be glad to show to visitors from the heating trade.

NEWELL P. ANDRUS of Abendroth Bros., New York, was a visitor at *The Metal Worker* office this week previous to his departure for Boston, where he will visit the heating trade in the interest of the Andrus water heater.

D. W. RICHARDS, Bedford, Pa., intends to add steam and hot water heating to his business, and would be glad to receive catalogues or other printed matter from the heating trade. He also informs us that he would like to get the agency for a good line of heaters.

A. T. HENDERSON of the United States Heater Company, Detroit, Mich., was in New York during the past week visiting the trade in company with W. S. Newkirk, who was recently appointed New York agent of the United States Heater Company.

A LETTER from the W. H. Page Boiler Company announces the opening of a New York office for the sale of the All Right, Volunteer and Page sectional boilers for steam and hot water heating at 61 Gold street, under the management of Alexander Don.

TOULMIN BOILER COMPANY are opening an office at 141 Centre street, New York, and have placed one of their Toulmin sectional boilers at one side of the entrance.

D. R. McCALUM, manager of the New York office at 69 Centre street of the J. H. McLain Company of Canton, Ohio, is making a trip among the heating trade and will stop at Baltimore and Washington in his itinerary in the interest of the Humber and Cambridge steam and hot water heaters and the general line of heating goods made by the company. He is distributing among the trade a new 32-page price-list which gives the capacity for radiation and full particulars with reference to the heating apparatus made by the company. We notice on pages 10 and 12 cuts of the Cornell steam and Princeton hot water heaters, new apparatus of the vertical section type, and on page 16 the Rugby steam heater, which is of the single dome direct draft type. The last pages of the book are devoted to radiator valves, expansion tanks, thermometers and steam fitting supplies. Geo. Plastow is in charge of the office in his absence.

IT IS EXPECTED that Treasurer Judson A. Goodrich of the American Radiator Company, 92 Centre street, New York, will sail from the Bermudas, where he

has been taking a vacation, in time to reach New York next week.

A. H. FOWLER of the Fowler Radiator Company, Norristown, Pa., spent a few days in New York this week talking about the Fowler direct and indirect Radiators.

W. C. HIGGINS of the Richmond Store Company, Norwich, Conn., visited Albert A. Oryer & Co., 85 Centre street, New York, in the interest of their line of steam and hot water apparatus.

MR SULLIVAN of the firm of Sullivan & Kennedy, heating contractors, of Holyoke, Mass., visited the heating trade in New York this week.

W. A. RUSSELL, 89 Centre street, New York, is displaying samples of the Novelty steam generator and the Novelty hot water circulator in the interest of the Model Heating Company, Philadelphia. They are finished in white with the lettering gilded, the galvanized iron jacket being coated with silver bronze. He is also displaying on a sample board a line of engine lubricators and oil cups, made by the Detroit Lubricator Company, Detroit, Mich., whose line of steam and hot water valves he is pushing.

WALTER PENDLETON, manager of the New York office, at 89 Centre street, of the Niagara Radiator Company, Buffalo, N. Y., is showing photographs of the new Niagara direct indirect radiator. Mr. Pendleton has recently returned from a trip to Boston in the interest of the company. He has just secured a storehouse at 56 Franklin street, New York, where he will have capacity to store eight carloads of radiators, and it is the intention of the company to carry a stock at this place in order to fill orders promptly.

THE CATALOGUE that the Smith & Winchester Company of Boston, Mass., are sending to the trade in the interests of the Winchester boiler of their manufacture is an exceptionally pretty example of pamphlet making. The outside cover is designed with great taste and is neither overornamented nor too plain to be inconspicuous. The pamphlet is held together by a silk cord at the back. It begins with an address to the public and the trade, in which they give briefly the history of the Winchester boiler and why it was brought out. Then follows a straightway description of this well-known apparatus, with various views of the boiler. It is not made too elaborate, but the principal points merely are covered. The table of contents follows and then the telegraphic code. Next a few pages are given up to various radiators, illustrated by half-tone engravings, and then comes the reference portion of the publication. It consists of some 30 odd pages, the title of which is "From our Friends," and gives letters from all people in all places, and all in favor of the Winchester heater. The pretty feature of the pamphlet are the head lines, cross heads and other prominent words printed in red ink.

ELIAS BERLA, 88 Mulberry street, Newark, N. J., has recently enlarged his construction shop, and has placed a boiler to run his machine tools, the latest addition to his plant being a machine to cut pipe up to 12 inches in diameter. He also has a machine of an improved type for cutting pipe of smaller sizes. He is now preparing to cut pipe from specification at short notice. Mr. Berla is using 8000 feet of

Niagara radiators in a row of houses where he is installing the heating plant.

A RISE IN RADIATORS is seldom pleasing to the heating trade, but the elevation of the Royal Union, Champion Union, Union and Reed radiators on a platform in the showrooms of the H. B. Smith Company, 133 Centre street, New York, adds to their attractiveness.

The Oster Adjustable Ratchet Die Stock.

The Oster tool, which is herewith illustrated, has just been brought out by the Oster Mfg. Company of Cleveland, Ohio, who have applied for a patent on it. The adjustable principle is the same as that in use in the company's die stocks, which are well known. The new tool is intended for plumbers and steam fitters, pump fitters and other mechanics who have any occasion to thread pipes. It is arranged for use with two handles released from ratchet gear or with one handle as a ratchet tool. This enables it to be used as the regular shop tool and also out of the shop for work in ditches and close corners where there is but little room

Adjustable Ratchet Die Stock.

to operate the handles. A simple but effective device enables it to be adapted to cutting either a right or left hand thread. It is fitted with a leader screw to start the thread so that it can be operated satisfactorily by an unskilled workman. A positive stop enables the operator to thread any number of pieces of one size without resetting. There are no pockets in which chips or dirt can accumulate to clog the tool or retard the work. Pipe can be threaded and cut off without changing the tool. The dies and cut off blade can be easily and quickly removed and sharpened on a grindstone. Oil holes are provided to admit oil to the cutting edge of the dies and cut off blades. Three sizes of this tool are made. No. 7 weighs 22 pounds and will cover 1 to 2 inches; No. 8, 60 pounds, 2½ to 4 inches; No. 9, 80 pounds, 4½ to 6 inches.

The latest application of aluminum, which is reported from England, is one of the most extraordinary to which this versatile metal has yet been put. It is no less than the formation of an artificial ear for a man who had lost one of these organs through disease. An artificial ear was built up in wax, similar to the natural ear on the opposite side. It was then made in aluminum and tinted and enameled to harmonize with the complexion. To support the aluminum ear adhesion was effected by means of a saturated solution of gum mastic in absolute alcohol. The man was thus accommodated at the Queen's Hospital, at Birmingham, and the doctors there report that he can now hear as well as ever.

THE RETAIL STORE.

The New Process Gas Range.

The Standard Lighting Company, Cleveland, Ohio, are entering into the gas stove business with the same vigor which has characterized their operations in the manufacture of vapor stoves. An illustration is herewith presented of their new range, which is

ing made of a single plate cast with a continuous chamber without joints, avoiding possibility of leaks and more efficiently utilizing the heat. This water back is claimed to use but half the gas ordinarily burned in heating water, and this claim is supported by the statement that no cooking can be done over the water heater. Only enough heat es-

so as to allow the machine to be easily cleaned. The point is made that clothes in the machine are washed between suspended slats, which cross each other diagonally in opposite directions, and that the slats are placed at such a distance apart and present their corners to the clothes in such a manner as to cause the clothes to be rubbed together

New Process Gas Range.

shown in but one of several forms that have been designed to meet the requirements of the most exacting consumers. This range, in the first place, is dressed most attractively. Care has been taken to make it conform to the most modern ideas of daintiness in cooking apparatus. It is furnished with a cast top, cast oven racks, balance drop doors, jet lighter for oven and water-back burners, simmering burner, giant burner, flue connections, removable oven linings, adjustable air mixers and a number of special features. Prominent among these is the adoption of terne plate for the linings of doors, linings of ovens, drip pan, &c. Terne plate, being non-corrosive, forms a vastly superior lining to black plate, and is presented as having the preference over galvanized iron for these uses.

Another feature is the chop broiler on the side of the range. It is made with a sliding case or jacket which draws out with the pan, for which it acts as a support or table. The cut shows this sliding case partly drawn out. The burner for this broiler being above, it is utilized for another purpose. Tilting dampers over the burners permit the heat to pass upward and be used for heating a griddle to bake cakes when the broiler is not being operated. The water back is of new construction, be-

comes to moderately heat a warming oven.

The oven used is the company's Reflex, with side flues, which, in its application to gas stoves, is a decided departure. It bakes evenly on top and bottom without burning. Indicators are placed on the oven valves so that a glance tells whether they are open or closed, avoiding the necessity of the operator kneeling on the floor to see whether the burners are lit or how high the flame may be. The pilot lights are provided with air mixers so that they burn with a blue flame and do not deposit soot. The company have just issued a very complete catalogue in which this and other constructions are fully illustrated and described.

The Detroit Florin Washer.

Detroit Galvanizing & Sheet Metal Works, Detroit, Mich., are manufacturing the washing machine here shown. The tub of the washer is made of galvanized sheet iron to prevent it warping, splitting or leaking, and to be free from odor, also to make it light enough to allow the washer to be carried in and out of the house. The lower slats, which are shown outside the washer, are suspended in the tub so as to leave a water space below, and are removable

upon themselves. This, it is explained, is the true method of washing, and does not injure the clothes, because the slatting does not rub upon them. The

The Detroit Florin Washer.

manufacturers claim that the machine will wash everything from a rag carpet to a lace curtain; that it cannot tear or injure the finest goods; that it will clean everything without rubbing by hand, and that if rightly used it will run so easily that a child can operate it.

Oilgas Vaporizing Junior Cook Stove.

The Central Oilgas Stove Company are showing at their salesrooms in Boston, New York, Chicago and San Francisco, the Junior type of their oilgas vaporizing cook stoves, a picture of which is given herewith. The Junior style is made with one, two and three burners. The method of filling the tank is the same as in their larger stoves, a special tank being required. The stove is adapted for the use of kerosene or gasoline. With kerosene, by the construction of the burner, gas is generated and a flame is furnished similar to the flame secured from the use of gasoline, and

finished, and fitted with bronzed pulls. The manufacturer states that the boxes are not only light, strong, neat, attractive and labor saving, but that they are sold at a price which is small compared with the real value in the store; also that they were invented by a Hardware merchant thoroughly familiar with the requirements of the trade. The boxes

Oilgas Vaporizing Junior Cook Stove.

it is said of much greater heating power than can ordinarily be secured from the use of kerosene as a fuel. All their stoves are furnished this year with a graduated valve by which the heat and consumption of the burner can be regulated. Simple directions are furnished by the company for operating the stove so that success can be secured by the ordinary servant.

Bennett's Hardware Shelf Box.

J. S. Bennett, 332 Main street, Winnipeg, Canada, is offering to the Hardware and other trades a sample box

are patented in Canada and the United States and are protected in England. We are advised by Mr. Bennett that he is prepared to grant State rights for the manufacture and sale of these boxes, or that he would dispose of the United States patent.

MEMORANDA.

ESTEE WIRE WORKS COMPANY, 65 Fulton street, New York, with factories in Brooklyn, were incorporated March 1 last, capitalized at \$25,000. The officers are W. S. Estey, president; C. P. McGuire, vice-president, and W. O. Chapman, secretary. This concern was formerly W. S. Estey, the

Bennett's Hardware Shelf Box.

or drawer for shelf use, as here shown. The bottom and sides of the box are made of bright sheet iron or tin and the ends of wood, in which the metal is embedded. The point is made that there are no nail heads or any roughness on the boxes, that they are smooth to handle and that they slide on the shelves side by side without any trouble. The fronts and backs of the boxes are made of pine, enameled any color desired, or of hard wood, oil

business having been begun in 1876. They manufacture Wire Cloth of brass, copper, iron, galvanized and steel wire of all meshes and grades for mining, milling and other purposes, including locomotive spark Wire Cloth. Also Wire Work for bank, office and counter railing, store fronts, window guards, &c. In addition to the above they make Wire Cloth for windows, skylights, refineries, centrifugal machines, Sand and Coal Screens, Riddles for ex-

port and foundry use. Netting for henneries, Trellises, Bolting Cloths, Sifters and Rat Traps.

MALTBY, HENLEY & Co., 20 Warren street, New York, have renovated the interior of their office and salesroom floor. A new embossed steel ceiling, painted a delicate tint, has been put in and the side walls painted to correspond. This concern are large producers of Silver Plated Ware, Revolvers and various kinds of House Furnishing Goods, together with Shears, Scissors, Tin Spoons, &c.

BRIDGEPORT BRASS COMPANY, 19 Murray street, New York, have just placed in position a fine new natural oak sample case, with four sliding plate glass fronts. In it are sampled their new Rochester Lamps in the various styles, patterns, sizes and finishes, a full stock of which is now ready for the trade. These Lamps include stand, parlor and banquet patterns, founts and oil pots in brass, finished in silver plate, nickel, bright gold, oxidized silver, gilt, oxidized copper or plain brass. Some of them are embossed with watch dies and present a very attractive appearance, while others have cast bases, founts, &c. All the latest improvements are incorporated in this Lamp, as described in detail recently in these columns. To give an adequate idea of their work at Bridgeport, Conn., they have gotten out a large photograph, which is mounted in an antique oak frame, ready for hanging, 26 x 33 inches, lined with a narrow gilt molding and fitted with glass front. This is entitled "Home of the New Rochester Lamp, Bridgeport Brass Company."

HOFF & RAYMOND, Middletown, Pa., are opening a new general Hardware store in that place. They will conduct a wholesale and retail business. They advise us that they would be pleased to receive from the trade catalogues and spot cash prices on goods in their line.

ADDISON HARRIS, formerly of Moundsville, W. Va., has just opened a hardware store at Turtle Creek, Pa.

C. E. JENNINGS & Co., 79 Reade street, New York, have been appointed the sole agents for Chandler's ice cutting machine. This machine is designed for cutting ice into small diamond shaped pieces, and is said to occupy a space but 8 inches square. It is adapted for use with soda water fountains, while the larger sizes can be used for preparing ice for making ice cream.

J. G. BAILEY, Graham, Va., has sold out his stock of hardware, pumps and woodenware, &c., to A. H. Beall.

The director of the United States Mint has issued a preliminary calculation of gold production for the calendar year 1894, which places it at \$170,000,000 for the entire world, and \$43,000,000 for the United States. The official figures are not yet completed because of some discrepancy between the reports received, but they are believed to represent pretty closely the actual figures. A production of \$43,000,000 in this country will be an increase of about \$7,000,000 over the production of 1893; while the figures for the world will exceed the world's production of 1893 by about \$12,000,000. The larger part of the increase is due to the mines of the Witwatersrand region of South Africa, which are believed to have put out about \$10,000,000 more than the previous year.

ROOFING AND CORNICE.

Sheet Metal Ceilings.

BY DROP PRESS.

Sitting in a recently opened restaurant, the other day, where all of the fittings were of the handsomest character, my notice was directed to the ceiling by the remark of another guest who called the attention of his companion to the ceiling, saying that it was said to be made of steel.

Some argument resulted, as one claimed that if it was made of steel a joint would be made where the sheets were lapped, which could be readily seen. The proprietor was called upon to vindicate the assertion which had been made. He stated that it was steel and that he found that that character of ceiling was not only being used in public buildings but also in private houses. He was asked where the line was between the sheets. He stated that, although he was present when the ceiling was put up and knew that there were laps in it, he could not point them out now. I have seen sheet metal ceilings put up and know the process of manufacture and I was unable to find the joints between the sheets, although there was considerable plain surface in the design, which was of the high relief order.

This caused me to call on some of my friends in this line, and I find that their plants have been very much enlarged, due entirely to the demand for this character of ceiling. The trade seems to be somewhat divided. One class may be termed of the gaudy and striking character, and is largely used in saloons, barrooms, restaurants and buildings of that character. Another class is used in churches, halls and public buildings, some effects which are truly beautiful being gained in church work, where the ceiling panels are of one design with an appropriate frieze or border and the side walls partly down are covered with panels. While I was talking in one shop a gentleman called who stated that he had had another ceiling fall in his house, and only just after the occupants of the bed had risen. He now wanted a steel ceiling put up in this chamber and also in his dining room, as the ceiling there gave promise of demolishing his china if not removed at an early date. He stated that he desired the same design used in his dining room as had been used in his parlor. After his departure I asked if there were no objections raised against this ceiling for residences, and if some had not claimed that it had a sheet metal or cheap tin appearance. This brought me in contact with the order book, where numerous orders for sheet metal ceilings for various rooms in residences were recorded; and I was shown how, by good workmanship, the joints could be so made between the sheets that they were difficult to discern, and when properly painted could be entirely covered.

It is claimed that this character of work is increasing in demand through sheer force of merit. Some excellent artists are designing panels and decorating them when in place. One of the advantages of a sheet metal ceiling,

which has been demonstrated clearly, is its fire proof qualities. In a large retail house a fire occurred which smoked the ceiling, and as considerable water was thrown into the upper story the ceiling was deluged, and had it been of plaster would have had to be entirely replaced, although the fire was not otherwise destructive in extent. As a result of the steel ceiling not only were the goods under it prevented from being soaked with water, but the ceiling itself, after it had been dried out and freshly painted, at a very small cost, left no traces of the disaster. In another case a fire occurred in a business building on the floor above a show room where perishable and valuable goods were displayed. Through the efficiency of the steel ceiling no damage was done to the goods.

Sliding Roof for a Theater.

Among the latest uses to which electricity has been put is that of operating a sliding roof for a theater in Paris. According to a foreign publication the oval roof of the hall is divided into two parts, each of which is carried on four rollers traveling on a track. When once open the movable parts of the roof travel and press upon two sheltered platforms placed one above the stage and the other above the entrance hall. The rollers nearest to the center of the roof are arranged on each side on two axles, which are put respectively into motion by means of a sprocket chain and a train of gearing, the latter including a pinion arranged on the shaft of an electric motor. The two motors are arranged on each side of the roof. They are calculated for a speed of 1000 revolutions. On one side of the roof are suspended seven hard copper wires, upon which rub sliding contacts fixed to the two parts of the bridge. These wires are numbered, and are connected to insulated conductors leading to the switchboard, from which the roof is operated. The two circuit wires are brought in through a double pole cut out protecting a two-pole switch. From this switch one of the conductors is led to two switches, or magnetic cut outs, which are regulated in such a manner that the circuit of each motor is automatically opened if the intensity of the currents exceeds 10 amperes. Leaving these appliances the two circuits are conveyed each to a changing switch having suitable resistances for regulating the current. These changing switches carry two movable contacts which are insulated from each other. The upper is for putting in or out of a circuit a smaller or larger amount of resistance, and consequently varies the intensity of the current, this corresponding to alterations in the speed of the motors. Moreover, it assists the lower one in serving as reverser and in changing the direction of the current in the armature without altering that passing through the magnets in such a manner as to assure the change of the direction of rotation of the motors. In the positions occupied by the changing switches the switches are out

of circuit and no current traverses the motors, which are, of course, stationary. The two large semicircular segments placed at the bottom of the two switches are connected to the bare wires. The brushes connected at the entrance of each of the armatures make contact on these wires. On starting the motors absorb between 9 and 10 amperes, but once in operation the current used ranges from 5 to 7 amperes. The operation of putting the sliding roof in or out of position is effected in less than one minute at a cost of about a penny.

Arranged upon the two halves of the roof and on the vertical face of the bridge are two contacts, which, shortly before each part of the roof reaches the end of its travel, press upon two buttons, each actuating an electric bell placed under the switchboard. The latter are arranged in a battery circuit, and on ringing they indicate to the attendant, first, that stoppage is near, which allows the man to manipulate the rheostat so as to diminish the speed, and, secondly, on ceasing to ring, that the sliding parts have reached the end of their course, the contacts having passed over the buttons. If at this moment the attendant were to forget or neglect to interrupt the current, it might happen, the motor being unable to revolve because of its being wedged up, that the current would reach a value which would put the motor out of use. At that moment, however, the magnetic cut out acts and breaks the circuit. This apparatus is simple and is said works well.

FLASHINGS.

THOMAS H. HAYES, Waterbury, Conn., will build a brick waterhouse which will have a tin roof and a galvanized iron cornice.

LYLES & MILLS, 231 William street, New York, have a number of new designs in sheet metal ceiling and side wall panels, moldings and borders which will make their appearance in a new catalogue which is now in course of preparation. They are now preparing the work for the audience room of the new church at Sound Beach, Conn. They are also doing the work at the new school, 117th street and St. Nicholas avenue, and have completed a \$6000 contract for Hilton, Hughes & Co., and recently completed a contract of equal size for Telf, Weller & Co., 326 Broadway.

THE TROY PAINT & COLOR WORKS, Troy, N. Y., issued a colored card calling attention to the American Seal builders' and roofers' elastic oil cement. The front of the card is lithographed in colors and the back contains information about the use of roofing cement, with price lists.

THE MANILA FOLDER issued by the Metal Stamping & Spinning Company, Grand Rapids, Mich., will be of interest to the roofing and cornice trade, as showing examples of stamped ornaments, trimmings, &c., which this well-known firm put on the market. The sizes accompany the illustrations, and

the end of the folder, which is arranged for tearing off, gives an addressed order card to be sent to the Metal Stamping & Spinning Company.

THE BUSINESS formerly carried on by W. E. Spangler of Newark, N. J., manufacturer of the Spangler Single and Double Lock Edger and Folder, is to be continued by the W. S. Tool and Machine Works of York, Pa.

THE TROY COAL, TAR AND CHEMICAL COMPANY of Troy, N. Y., have been incorporated to manufacture and sell, among other goods, roofing and sheathing felts. The capital of the concern is \$25,000, and the directors are W. H. Squarey, C. W. Billinger and J. Cayrd of Troy.

THE ST. PAUL ROOFING CORNICE & ORNAMENT COMPANY, St. Paul, Minn., issue their special catalogue for 1895 addressed to architects and sheet metal contractors. The goods include stamped ornaments, steel ceilings and patent metallic sidings, as well as a large variety of pressed sheet metal work. The new features in this catalogue to which the concern direct particular attention are the remodeling of old buildings and which, by the system they employ—using their jointed siding plates and enriched with pressed zinc works—opens up a large field for architects and cornice-men. Illustrations of this work are shown in the catalogue. The metal faced, cement filled, fire proof building wall, upon which they have a recent patent, is alluded to, likewise their zinc ornaments, mostly from their own original designs. The volume, which contains some 40 pages, is most profusely illustrated and presents a very great variety of goods for the choice of the sheet metal worker. Along with the illustrations are particulars of sizes and prices, and where the subject warrants it full descriptive particulars are presented. At the end is a telegraphic code which will be of assistance in quick ordering. The pamphlet is bound in tinted paper.

THE SIMS MFG COMPANY have been changed to The Tucker Mfg. Company, Newark, Ohio. The company manufacture the well-known Sims roof gutter and Sims adjustable eave trough. A new brick addition has been made to the former plant, 80 x 100 feet, two stories high, in which a number of new and special machines have been installed. An elevator with capacity for lifting 2000 pounds and a 25 horsepower Westinghouse engine have also been added to the company's equipment. They state they are now in position to promptly care for all orders received, no matter of what magnitude.

FRANK VOIGTMANN, 120 and 131 North Franklin street, Chicago, has the contract for the copper work and tile roofing for the First Presbyterian Church, Evanston, Ill.

THE JEFFERSONVILLE CORRUGATING AND ROOFING COMPANY, Jeffersonville, Ind., issue a 12 page pamphlet calling attention to their manufactures. The first goods shown are their V-curved iron roofing, which is followed by corrugated roofing and siding of different styles. Then pressed standing seam roofing, roll and cap steel roofing, iron weather boarding, ridge caps, &c. Each page of the pamphlet emphasizes the fact that they sell only to jobbers. Particular attention is called to their roll and cap or standing seam iron roofing, which is fully illustrated.

SCRAP.

THE INSTALLATION of their tenth black plate mill has just been completed at the plant of the American Tin Plate Company, Elwood, Ind. A new sorting room is also on the point of being finished. The company are now employing 750 men at their works.

R. S. NEWBOLD SONS & Co., manufacturers of tinning machinery, Norristown, Pa., have increased their capacity by taking over the Eagle Iron Works, in that place. They propose making considerable improvements in the plant.

THERE has just been formed in Budapest, Hungary, a new company under the name of the Ungarisch Englische Metallwaren Gesellschaft, with a capital of \$130,000, the majority of which has been subscribed for in England. This company, to which reference was made in a note in these columns last week, has been formed to establish a plant for the manufacture of tin plates in Hungary. Among the directors are William Williams, J. W. Hughes and Roy Pritchard, all of Wales.

ACCORDING to the monthly statement of the Collector of Customs at this port there were 8,321,630 pounds of tin plates, valued at \$169,059, held in bonded warehouses in New York on March 31, 1895, as against 9,631,584 pounds, valued at \$209,092, similarly held on the corresponding date of last year. Reducing this amount to boxes of 112 pounds, it will be seen that the declared value of tin plates has shrunk in the interval about 16 cents per box.

A LARGE NUMBER of Welsh tin plate workers arrived last week in the American line steamer "Paris," from Southampton, and a further number are said to be on their way. Welsh papers remark that among these men are some of the best and most experienced workmen; and the curious part of the migration is that they are not generally men who are out of employment and driven to leave the country on that account. Most of these men, it is said, have voluntarily given up employment on the other side in order to come to this country, believing that there will be a better field for them in the United States in the future. The families of the men are preparing to follow them to this country.

THE ANDERSON FOUNDRY & MACHINE COMPANY, Anderson, Ind., who are now making a specialty of tin plate machinery, are reported as being full of work, necessitating the operation of their plant by night as well as by day, for the first time in two years. The company are planning a considerable addition to the capacity of their plant.

THE TINNING MACHINERY has been placed in the new works of the National Tin Plate Company, Elwood, Ind., during the past week. The plant is reported as fast nearing completion, and it is expected that it will be ready for operation soon after June 1.

AMERICAN TIN PLATES, and especially roofing terne, are having a heavy run in the district of which St. Louis, Mo., is the center. All the mills feeding that market are reported as being behind their orders.

THE MONONGAHELA TIN PLATE COMPANY, Pittsburgh, Pa., have introduced a number of women into their works. They are known as separators, and are under the direction of a woman who has worked in tin mills in Wales.

Two additional mills are being put into the Morewood Tin Plate Works, at Gas City, Ind.

THE NEW NORTON TIN PLATE & CAN WORKS, at Baltimore, Md., will consist of a tin plate works 275 x 60 feet and a can factory of 290 x 60 feet.

THE TOTTEN & HOGG IRON & STEEL FOUNDRY COMPANY of Pittsburgh, Pa., manufacturers of engines, rolling mill and tin mill machinery, are still running their shops night and day. They have lately shipped eight mills to the Montpelier Sheet & Tin Plate Company of Montpelier, Ind., eight mills to the National Tin Plate Company of Anderson, Ind., two mills to the Baltimore Iron, Steel & Tin Plate Company, Baltimore, Md., and are now ready to commence shipping the machinery for the Laughlin Nail Company's plant, at Martin's Ferry, Ohio. They have already sent forward the buildings, which are being erected as fast as possible. The Totten & Hogg Company are building the entire plant for the Laughlin Company, and when it is completed it will be one of the largest and finest plants in the country, as it will eventually consist of ten hot mills and seven cold rolling mills.

THE OHIO RIVER SHEET & TIN PLATE COMPANY of Pittsburgh have made application for a charter of incorporation. As already noted, this concern have let contracts for the erection of a tin plate plant at Rochester, Pa. A number of those prominently identified with the new concern are tin plate workers who were formerly employed at the plant of the U. S. Iron & Tin Plate Mfg. Company, at Dammer, Pa. The Leechburg Foundry & Machine Company have the contract for the erection of the plant.

THE MONONGAHELA TIN PLATE COMPANY, Pittsburgh, manufacturers of black plates, are now running six mills and expect to put three additional mills in operation in a short time.

THE COATES of Baltimore, who formerly owned the Locust Point Rolling Mill & Tin Plate Works, have leased the old rolling mill of the Baltimore & Ohio Railroad Company, at Cumberland, Md., which they will, it is announced, turn into a tin plate plant.

WORK has been resumed this week at the mills of the Waterloo Tin Plate Company, Machen, Monmouthshire.

WE HAVE BEEN FAVORED by Marshall Bros. & Co. of Philadelphia with two handsome sample sheets of their best quality of bright charcoal and terne plates, which, from inspection, go far to justify the high claims made by this concern for their product. The roofing plate stamped "Marshall" is an extra heavy coated spangle terne, carrying, they inform us, from 28 to 30 pounds of coating per box. The coating is very evenly impoited and the plate itself appears to be of the best quality. The accompanying sample of the firm's "Penn Treaty" charcoal plate, which they are selling in competition with the foreign "Melyn" grade, seems to be in every way the equal of that well-known brand. Messrs. Marshall inform us that these plates are giving great satisfaction to their customers. They are made from black sheets rolled at the firm's own mill.

A NEATLY GOTTEN UP CIRCULAR, printed in red and black, and headed

by an emblem representing the "Bird of Freedom" bearing in its talons a box of tin plates marked "Trotter's American New Method," reaches us from Nathan Trotter & Co., 36 North Front street, Philadelphia. The circular draws attention to the fact that the firm are now producing at their works in Philadelphia, by a new method, with improved American machines, a roofing plate under the before mentioned name, which they claim to be the finest extra heavy double coated terne on the market, and each sheet of which is stamped with brand and thickness. The firm have also favored us with a sample of a handy little blot sheet, which they are distributing to the trade, and which, on one side, sets forth the merits of "Trotter's Roofing" tin.

Iron and Steel Sheets.

The regular monthly meeting of the Iron and Steel Sheet Manufacturers' Association was held in the Conestoga Building, Pittsburgh, Pa., on Wednesday, the 17th inst.; J. G. Battelle of the Piqua Rolling Mill Company, Piqua, Ohio, presided, and John Jarrett was secretary. The meeting was very largely attended, nearly every concern in the country making iron and steel sheets being represented in person. It has been recognized for some time that something should be done to bring about some improvement in the condition of the sheet trade, as prices are claimed to have been very unprofitable for a long time. Another point that was up for discussion was the great difference in prices charged by different concerns for the same gauges. Upon investigation it was found that on the same gauges differences in prices ranging from \$2 to \$4 a ton existed, and for the purpose of bringing about more uniformity, it was suggested that a 2.20 cent base be fixed as the price of No. 27 steel sheets, f.o.b. at mill. It was also agreed to ask an advance of $\frac{1}{2}$ cent per pound on all gauges, and not to enter orders for delivery after July 1. Nearly every concern represented at the meeting reported that demand has been improving for some time, and a large tonnage has been booked for delivery between now and July 1. In view of a possibility of still higher prices for raw material it was deemed advisable to not sell after the above date at present prices.

HEATING & PLUMBING.

NEW WORK AND CONTRACTS.

THE CONTRACT for the steam heating of the Fort Dearborn Building awarded to Kroeschel Brothers, 41 to 55 Erie street, Chicago, has been completed. It contains 14,000 feet of radiation surface. There are three boilers, 60 x 16 and 75 horse power, three Barr pumps for boiler and house supply. There are 323 radiators in the building equipped with the Johnson system of electric valves, and the Kroeschel feed water heater is also intact. Taken throughout it is said to be a first-class system and has been placed without stint of space or money. The Durham system of plumbing is used and was constructed by Hanley & Casey of 21 Quincy street. In this system all the vertical risers, wastes, vents and

down spouts are of wrought iron pipe, coated inside and outside while hot with coal tar varnish. All pipes for carrying sewage in the ground under the building are of cast iron, cast in 12-foot lengths. Hanley & Casey, owing to the growth of their business, have moved to their new quarters, 17 Plymouth place, where they will have a shop 30 x 100 feet and also their offices.

ARTHUR SHEA, Rockland, Me., has a crew at work plumbing the John A. Lowe house, Vinalhaven, and another large crew at Squirrel Island working on the big hotel there.

ANDREW MOE, Eau Claire, Wis., bid \$1150 and secured the contract for plumbing the Third Ward School.

THE ST. ELMO CHAPTER HOUSE at Yale College, New Haven, will be built by A. W. Burritt of Bridgeport, Conn. The building will cost \$25,000, including the heating plant which will be needed.

JAMES E. LACEY, Hartford, Conn., is building a block of brick three-story flats which will have a sanitary system and a heating system.

A NEW PAROCHIAL SCHOOL will be built at Bridgeport, Conn., under the supervision of the Rev. Father O'Brien. It will have a slate roof and galvanized iron cornice, and a system of heating and plumbing.

BARLOW BROS., Waterbury, Conn., have the contract for the plumbing in the new factory of the Waterbury Machine Company, and in the new Washington School Building.

JOHN M. PAGE & Co., Naugatuck, Conn., have the contract for heating and plumbing the new house to be erected for George Runney on Hillside avenue. A hot water system will be put in.

THE CONTRACT for the plumbing, gas fitting, heating and ventilating in the Hart Memorial Library Building has been awarded to Mulligan & Schermerhorn of Troy, N. Y.

JOHN D. MOUTAT, Detroit, Mich., has contracted to do the plumbing and gas fitting in Traugott Schmidt's new eight-story building; also to do the steam heating, plumbing and gas fitting in A. C. McGraw's apartment building, "The Jefferson."

BUEKEL & Co. of Boston, Mass., are heating the addition to the store of R. H. White & Co. in Boston, and are using the Exeter radiators; the same radiators are also being used by W. E. Paul of Portsmouth, N. H., who is making improvements in the heating apparatus of the Fiske House, at Old Orchard.

THE plumbing contract for the new Physics Building at Kansas University has been given to the Lawrence Plumbing & Heating Company, Lawrence, Kan.

JESCHKE & TIMPLE, 398 West Chicago avenue, Chicago, have the contract for the plumbing and drainage in the residence of J. Fritz, 39 Samuel street.

CHARLES KOSTEVY, 218 West Eighth street, Chicago, is to do the plumbing and drainage in the flat building of James Matousek, Twenty-second street and Kedzie avenue.

RICHARD TAIT, 605 Sixty-ninth street, Chicago, has the contract for the plumbing and drainage in the flat building of Frank McPhetridge, Howard street.

FREDERICK SCHOLEFIELD, 310 South California avenue, Chicago, is to do the plumbing and drainage in the flat building of J. Berry, 1190 Congress street.

JACOB COURATH, 5900 Princeton avenue, Chicago, is to do the plumbing and drainage in the two flat buildings of Frank P. Burke, Wabash avenue, near Forty-eighth street.

DAVID WALSH, 6848 South Chicago avenue, Chicago, has the contract for the plumbing in the flat building of P. J. Simmons, 6223 Langley avenue.

FREDERICK NEUSTADT, 300 North avenue, Chicago, is to do the plumbing and drainage in the residence of W. Ocock, 23 Florence avenue.

FRANK J. RUH, 1204 Diversey street, Chicago, has the contract for the plumbing and drainage in the flat buildings of W. Haferkamp, 1150 Seminar avenue, and W. E. Howorth, 1398 North Clark street.

JOHN C. GUNDERMANN, 182 North avenue, Chicago, has the contract for the plumbing and drainage in the flat building of M. Nortmire, 1438 Roscoe street.

NOBLE & THUMM, 288 Lincoln avenue, Chicago, have the contract for the plumbing and drainage in the flat building of M. Lurdquest, 1727 Sherman place.

ALWIN W. BARN, 393 Gross Park avenue, Chicago, is to do the plumbing and drainage in the flat building of J. Keister, 1114 Diversey street.

KIRLEY & STAHL, Albany, N. Y., have been awarded the contract for plumbing in the new Public Building at \$1347.

JAMES BATHGATE, Cohoes, N. Y., has a contract for the plumbing in the new residence of Police Sergt. Jamison.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until May 8, for the low pressure return circulation, steam heating and ventilating apparatus for the U. S. Post Office, &c., Building, at Worcester, Mass. Copies of drawings and specifications can be obtained from the Supervising Architect, Washington, or from the Superintendent at Worcester.

THE NEW ORLEANS RAILROAD & SUPPLY COMPANY, New Orleans, La., have contracted for installing a heating plant in the new St. Charles Hotel, and will use 30,000 feet of Niagara radiators.

THOMAS W. WEATHERED'S SONS, 141 Centre street, New York, are building a fine conservatory and installing the heating system for H. H. Cook, Lenox, Mass. It consists of a palm house, grape, violet house, rose house, propagating house, and a potting house. They are also building a large conservatory for Leopold Strauss, Baltimore, Md., in which they are installing the heating plant.

E. RUTZLER, 178 Centre street, New York, has the contract for heating the University Building at Washington Square, New York, and will use 13,000 feet of Joy's Crescent radiators.

The Secretary of War has informed the city authorities of New Haven, Conn., that a drawbridge must be built over the Guinnipiac River at that place in the room of the existing structure. The city must build the bridge before the end of next year.

STOVE TRADE NOTES.

Stove Secretaryship.

We have received from a member of the stove trade the following communication relative to the stove secretaryship:

The death of Mr. Thomas leaves vacant a most important position affecting the interests of the stove manufacturers, and it will be well for members of the National Association to consider who should fill his place. An election for permanent secretary will, no doubt, be held at the next meeting of the National Association of Stove Manufacturers in May, and I desire to use your columns to present for the consideration of the Association the name of a gentleman who is now vice-president of the Defense Association and under whose able and wise management, since he has filled that position, several strikes have been avoided, the interests of the Association fostered, and matters in several cases arranged to the satisfaction of both employer and employee. As a stove manufacturer he has had over 30 years' experience, and no man knows better how to handle the many vexatious questions which confront the stove manufacturers. I feel confident that all members of our association who have been in any way connected with William T. Bradberry will agree that he is eminently fitted for the place. Mr. Bradberry resides in Pittsburgh and is president of the Anshutz Bradberry Company.

Test of the Perfection Gas Range.

The old truism that "the proof of the pudding is in the eating thereof" was, so to speak, recently given an airing when the Union Stove Works, in order to thoroughly test the Perfection gas ranges, for which they have the sole control and sale in New York, New Jersey and all the New England States, gave to a number of their clerks a "Delmonico" dinner, cooked by means of one of the ranges named. The one selected was a No. 171 Perfection, designed for use in ordinary families, the argument being that if enough food could be cooked with it to satisfy the taste and capacity of 12 clerks with no particular reputation for small appetites, it would certainly be all sufficient to do the cooking in an ordinary family. The company's cashier acted as chef and was assisted more or less by suggestions from the trio of young ladies in the service of the company. The dinner was practically an impromptu affair, and was suggested while a trial of the oven of the range was being made to bake a few biscuits. Acting on the suggestion, a 10-pound roast and a 4-pound shad, together with all the vegetables, sugar, milk, butter and all necessities for sauces and fixings were purchased, and in the afternoon the stove was started up, the chef getting in his fine work, producing a dinner to which all the clerks sat down and devoured, after closing hours, and which all pronounced A. 1.

There might be some slight exaggeration in saying that the viand rivalled

anything that could be obtained at the "Martin" or "Delmonico's" and yet it would be understating the truth if it were not said that everything was done to a turn, and settled any question as to the baking or boiling qualities of the range beyond any shadow of a doubt. The 10 pound roast of meat was roasted in the lower oven while a large batch of biscuits was baked in the upper oven, and later the shad was broiled in the lower oven while a cottage pudding was baked in the upper oven.

A Suggestion to Furnace Makers.

A correspondent, signing himself "Jersey," sends us the following communication that will be read with interest and possibly with profit:

Your Trade Notes on furnaces in *The Metal Worker* April 6 were interesting, and if you get more let us have them. Dealers putting up furnaces will be glad to do good work if they can get paid for it. Much of the work now put in new buildings is bad enough, we all know, but well worth the price paid for it by the builder. We all do good work when we can and have customers looking to us to give them value for the money. Suppose you suggest to the manufacturers that it is a good idea when they make a "standard" to live up to it for a year or two, and not put out a cheap heater with name and outside appearance so like the "standard" that the owner will not know the difference. It is not fair to the dealer to ask him to "fool" his customer. If we sell our customer the "best on earth" this year, we want to give him the same quality next year and not have him suppose the dealer around the corner can furnish the same thing at half our estimate.

West Side Foundry Company.

The new illustrated catalogue of the West Side Foundry Company, Troy, N. Y., and with offices in Buffalo, N. Y., and Toledo, Ohio, is a very tasteful publication, nearly square in form with rounded corners and covers of a handsome shade of green, the "Owl" and crescent trade-mark of the company constituting a prominent embellishment. The company are makers of the Paris ranges, stoves and heaters, having succeeded the Paris Mfg. Company in May, 1894. Having purchased all the right and interest of the Paris company they retain the name "Paris" as a brand and the "Owl" as a trade-mark. The company have greatly improved, simplified and increased their lines of ranges, heaters, etc., and refer to them at length in the catalogue under review. The first described is the Paris Ideal, a 6 hole range with smokeless attachments, ventilated oven, sheet flue, drop oven door, made to swing upon hinges or divide in the middle, the lower half becoming a shelf; a rake attached to the oven shelf by which any dish can be brought to the front of the oven or

on the lower half of the door without putting the hand into the oven, and a hot closet near the oven under the reservoir.

The Daisy Ideal, another 6 hole range, having the same features as the large Ideal, with the exception that it is made only with swing oven doors and intended for either hard or soft coal or wood; the famous Paris, a centre fire box range, with sheet flue construction and ventilating oven; the Double Draft 6 hole range, with smokeless attachments, broiling arrangements, &c.; the Paris Home Comfort, one of the latest patterns, with very large oven. It has a slide hearth, large ash pan, removable grates, and is designed for either hard or soft coal or wood; the New Home Comfort 6 hole range, made in four sizes, for hard or soft coal or wood; the Paris Marvel, a heavy, durable, 4-hole range, moderate in price and handsome in design, and the Masterpiece range, made exclusively for soft coal or wood, and having soft coal pouch feed and iron linings, are some of the goods which follow. The Peacemaker is one of the regulation style cook stoves, designed for soft coal or wood, having triple surface or duplex grate, and made in two sizes, fully nickel plated. The Morning Pride is similar to this one, but has a soft coal pouch feed and heavy iron linings. The Town Talk is a large handsome cook, with fire box 24 inches long, and the Paris Premier range, which follows, is especially adapted for flats or apartment houses. It can be furnished with high or low closets, extra high shelf for horizontal boiler, water fronts and couplings and square oven. The Masterpiece square parlor base burner is an entirely new stove of original design. The hot air circulation is accomplished through two flues in the back in conjunction with the main flues. It is easily taken apart or put together and is offered in two sizes. The Masterpiece Junior is new this season, and has automatic feeder cover, removable fire pot, large ash pan, anti-clinker draw centre grate, &c. It is made in three sizes. The Imperial base burner is another novelty, with very large slide base flues, the heat passing down between the fire pot and the sheet iron section around the entire body of the stove to the slide flue and base and then through the centre of the base to the exit. It is made in three sizes with sheet or cast iron body and has all the late features. The Paris Cottage and parlor range combined is a rather unique construction which can be used for cooking and baking and is made in two sizes. The Fernwood is a neat wood parlor, with two boiler holes on top, and can be used for cooking purposes. It is made either direct draft or with double reversible flue.

THE READING STOVE WORKS, Reading, Pa., resumed operations in that portion of their plant which was closed down a short time ago on account of necessary repairs to the engine. These having been completed the works started up on the morning of Saturday, April 6.

Oil Stoves in Turkey.

A recent report from the French Chamber of Commerce at Constantinople, published in the *British Trade Journal*, which speaks of the growing demand for oil stoves in Turkey, and the possibility of building up a considerable trade in these articles in that country, may be of interest to the manufacturers of oil stoves in the United States. The report runs as follows: For the past two years petroleum stoves have been imported from England and they have met with some success. They usually consist of a very large petroleum lamp, the glass of which (red at the bottom, white in the middle and green on top) is surrounded by an iron wire trellis. The lamp rests in a socket sustained on feet which are elegantly joined to a large cap or head piece, the surface of which is flattened to receive a vessel for boiling water. Other types have since been introduced, but whereas in the winter of 1893-94 these stoves were not noted they have become quite fashionable for winter use in 1894-95. These goods will probably have an extensive sale in the coming winter. In general, an elegant, strong article is demanded; one which cannot be easily overturned. The lamp should be easily extinguishable, and cleaning and lighting should not be attended by any difficulties. It should burn common petroleum without emitting any smell and chimney glasses should be done away with. These stoves fetched this year from 40 to 46 francs apiece retail, or one-half the price paid in England. It is estimated that from 200 to 300 stoves were sold in 1894, but the trade next year is expected to be ten times as much.

Dowagiac Restores Wages.

The entire stove trade is interested in the news sent out from Dowagiac, Mich., on Tuesday. The strike in the Round Oak Stove Works has been settled, the manufacturers agreeing to restore the former schedule of wages. It is not often that labor troubles in a single establishment assume so much importance as in this case, but the circumstances have been peculiar. Much depended upon the outcome of the strike at Dowagiac. Usually the sympathies of other manufacturers are with an establishment having a strike on its hands. Help is often extended, and in many other ways encouragement is given, for other employers are apt to feel that they may at some time be involved in a labor trouble themselves and may need the active co-operation of their colleagues. But the strike at Dowagiac was not regarded from the usual standpoint. A cut in workmen's wages had been made in contravention of the policy of the National Association of Stove Manufacturers, the reasons for which have been frequently set forth in these columns. A simultaneous reduction in the price of oak stoves was announced, which was also not in conformity with the policy of the associated manufacturers. They preferred to maintain the price of stoves and pay their workmen the same rate of wages as was paid when times were good, believing that no more stoves would be sold in the aggregate even if prices were cut. The Round Oak Stove Works proposed to try the other policy.

At a conference recently held in Chicago between representatives of the Stove Founders' National Defense Association and the Molders' Union, an agreement is said to have been reached

by which the manufacturers of oak stoves belonging to that association were to be favored with the same reduction in wages as that made at Dowagiac. If, however, the old rate of wages should be restored at Dowagiac, no cut was to be made by the manufacturers referred to. The officers of the molders' union were of course very anxious to keep up their members' wages, and from that time made every effort to secure a change in the policy of the managers of the Round Oak Stove Works. That they have succeeded is shown by the news sent out from Dowagiac on Tuesday. It is to the credit of the Round Oak Stove Works that the managers have not decided to obstinately adhere to the course which they had marked out for themselves. Had they steadfastly determined not to listen to the appeals of outsiders, but to press the reduction in wages and in the selling price of their stoves, a reduction would shortly have been made in competing establishments which would very probably have spread to other classes of stoves, seriously unsettling matters all along the line. As it is, wages will now be maintained at the old standard in stove foundries, prices of stoves will not be demoralized, and members of the trade in general will continue to know precisely where they stand. It is a source of great satisfaction to know that a most irritating question has been thus satisfactorily settled.

ODD PLATES.

THE STANDARD LIGHTING COMPANY of Cleveland, Ohio, are building a fine addition to their already extensive plant. It will be of brick, three stories high, and will cover a ground space 169 x 150 feet. With the present building this will give the company a frontage of 400 feet. The entire structure will be used for their own purposes. In a court in the center will be erected a large jannpaning building, 80 x 30 feet, two stories high, which will be heated by steam instead of by coke in the old-fashioned way. The company further propose to put in a generator to enable them to run their machinery by electricity. Each shop will then have a separate motor, and in some cases short stretches of shafting will be run by a separate motor, so that special departments can run overtime, when necessary, without running the whole factory. A large part of the first floor will be used for offices, it being the intention of the company to provide offices of a much more convenient and attractive character than those which have thus far been used. The additional factory room was, however, most imperatively needed, the present quarters being uncomfortably overcrowded.

THE NATIONAL VAPOR STOVE MFG. COMPANY, of Lorain, Ohio, have been reorganized and are now proceeding on a sound basis. Charles E. Adams of the Cleveland Hardware Company, is president and manager, H. B. Hunt is vice-president and Joseph Colwell is treasurer. The stockholders are prominent business men of Cleveland, who propose to push the business of the company from this time forward. The factory is well located as to railroad facilities, finely equipped with machinery, and is at present employing 75 men turning out generator stoves for this year's trade. All arrangements are being made for the addition of new process stoves to the company's line, so that their customers can be supplied with such stoves for next year's trade.

Among the assets of the old company was a license for the manufacture of these stoves, which the new company will now make effective.

THE VAPOR STOVE ASSOCIATION held their regular April meeting in Cleveland on Wednesday of last week. Nothing of special interest transpired beyond an agreement to hold the August meeting at Mackinac, in order to get the full benefit of bracing lake breezes. It will take place on the 6th of that month.

THE FAVORITE STOVE & RANGE COMPANY of Piqua, Ohio, are the complainants in a suit brought in the United States Circuit Court at Cincinnati against Herman Soehner, a stove dealer at South Jefferson, for alleged infringements of a patented improvement in cooking stoves. The petition alleges that Stanhope Boal of Piqua, Ohio, is the inventor of the improvement which he has had patented and assigned to the complainants.

THE PITTSBURGH STOVE COMPANY of Pittston, Pa., resumed operations on Tuesday, April 9, the plant having been idle for some little time past, owing to differences existing between the employees and the management.

THE WICHITA STOVE & IRON WORKS, Wichita, Kansas, are now occupying their new buildings on First street, between the Atchison, Topeka & Santa Fé and the Chicago, Rock Island & Pacific Railroad tracks. The new building is 108 x 100 feet in size, the east front resting on the Rock Island and the west front on the Santa Fé road. The main building is two stories its full length, with one story wings on each side and at the east end, making the ground floor plan T-shaped. We understand that the company have some new designs of stoves which they expect to place on the market in a very short time.

THE NEW FOUNDRY of the Clark Stove Company, Armourdale, Mo., is nearly completed and the machinery is largely in place. The company have several new patterns of stoves which will soon be placed upon the market, and when the works are started it is expected that a force of 30 skilled workmen will be employed.

MOSER & WEHRLE of Newark, Ohio, closed their works on Saturday, April 6, all employees being notified that the plant would be idle for a month or more. No reason was given for the shut down except that the company were overstocked with stoves.

THE SCHNEIDER & TRENKAMP COMPANY have recently issued a circular stating that the continued increase of their Western business has obliged them to look for larger and more commodious quarters in Chicago, Ill. They have therefore secured offices and warehouse at 62, 64 and 66 South Canal street, where they will carry a large and complete assortment of both gas and gasoline stoves, together with a full line of repairs. This will enable them to supply their Western trade with goods promptly. Owing to the resignation of H. R. Hamilton, their Chicago representative, George W. Rue will hereafter have the management of their Western business. Mr. Hamilton will continue doing business at the old stand, 67 and 69 Lake street.

THE DETROIT STOVE WORKS, Detroit, Mich., are distributing a 24 page pamphlet of pocket size, relating to the Detroit Jewel gas stoves, which are manufactured in varieties to meet the wants of the trade. The goods are

tastefully illustrated and described in such a way as to emphasize their points of merit. Jewel burners are illustrated and described as well as Jewel hot plates or table gas stoves. A few of the advantages of gas as a fuel are also presented.

WE ARE INDEBTED to the Eclipse Stove Company of Mansfield, Ohio, for a copy of the quarterly calendar which they are distributing to the trade with their compliments. It covers the months of April, May and June, each leaflet having as a background a picture of one of the company's cook stoves or ranges. Each leaf is intended for six days only, Sundays being omitted. The printing is in red and green upon a paper of light straw color, attached to a buff card measuring about 7 x 9½ inches, which is intended to be hung up. Across the top is the trademark of the company, while down the sides is a request to write for catalogue and discounts.

THE MEYER FURNACE COMPANY of 1300 1304 South Washington street, Peoria, Ill., have issued a 32-page catalogue calling attention to the Weir gas and soot consuming furnace, which is offered in several varieties, the heater being fully illustrated and described at considerable length. Directions, accompanied by a diagram, are given for setting the heater in brick work, while other views show the sectional fire pot and grates employed in connection with the furnace. The catalogue also contains a price-list of registers, borders and faces, as well as a large number of testimonial letters from some of those who have used the goods named.

W. E. PUFFER, 186 Beekman street, New York, is distributing to the trade a 24-page catalogue of his automatic furnace regulator. The regulator is operated by the expansion of a brass tube which is placed in the hot air chamber above the radiator of the furnace. It is provided with an arm by which it may be attached to a lever operating the draft damper and check damper of the furnace. It is also provided with a dial by which the movement of the arm working the lever may be governed according to the requirements of the house, as indicated on the dial face. It is claimed that when the regulator is properly adjusted it will regulate the drafts so as to keep the air going through the furnace to the house at the desired temperature to secure comfort. Several pages are devoted to testimonials, and full directions are given for attaching the regulator.

THE FRESHETS, which are the usual accompaniment of the breaking up of winter, wrought considerable damage throughout various sections of the country during the past week or two. In the New England States rivers were higher than for a number of years past, and in some instances damage was caused in an unusual manner. In Bangor, Me., the most serious effect of the rain and freshet was experienced on the afternoon of Wednesday, April 10, when a landslide occurred. According to press dispatches from that city a large section of a high hill in the rear of the warehouse of the Wood-Bishop Company was so softened by the tremendous rains that it slid down upon the building, crushing it as though it had been an egg shell. The account states that the side of the building was torn in pieces and huge timbers were broken like pipe stems. In the corner where the weight of the slide struck

there were 100 ranges piled ready for shipment, and these, it is needless to relate, were made fit subjects for the scrap heap.

THE CRAIG REYNOLDS FOUNDRY COMPANY of Dayton, Ohio, last week issued a circular letter to the furnace trade, calling attention to the advantages resulting to dealers from handling the Triumph heaters. The company set forth the terms under which they will be glad to ship sample furnaces, and refer to the workmanship, construction and practical advantages as being of a character which have only to be understood in order to be appreciated. Accompanying the letter is a four-page folder illustrating various forms of the Triumph heater and setting forth some of the more important features of merit.

GEORGE M. CLARK & Co., 159-161 Superior street, Chicago, are offering a reward of \$500 for the recovery of the body of one of their foremen, George W. Ebersol, who disappeared April 2, and is believed to have been murdered. Mr. Ebersol was a young man of excellent habits and faultless domestic relations, had been in the employ of the firm for ten years, and had risen to be one of their most efficient and trustworthy foremen.

THE JOHN VAN RANGE COMPANY of 169 Elm and 4, 6, 8 and 10 Home streets, Cincinnati, Ohio, have furnished the entire culinary apparatus for a large restaurant just opened in Pittsburgh by the Goettman Brothers. This restaurant, we understand, has been fitted up regardless of expense, and the appointments are first class in every particular. A great deal of the cooking is to be done by steam, and the latest improved apparatus, with a capacity for 2000 persons at one meal, has been installed. The John Van Range Company have also furnished a new and very complete kitchen equipment for the Egnew, a hotel at Mt. Clemens, Mich., which opened on Thursday, the 18th inst.

W. F. GREENE, Troy, N. Y., was granted a patent on his Zero poker and lifter April 16, 1895.

"THE BEAVER FURNACE" is the subject of an exceedingly neat little pamphlet of eight pages which has been issued by W. E. Patchin, 195 Monroe street, Rochester, N. Y., sole agent for the heater in that city. The little pamphlet contains a few of the names of the most prominent residents of Rochester who have tested the merits of the Beaver furnace, and there are also given a number of letters showing the satisfaction which the heater has given in operation.

CLARK BROS.' new stove foundry on South Adams street, Armourdale, Kansas City, is practically completed. The building is of brick, and is said to compare very favorably with other manufacturing concerns in the city. It has been stocked with modern machinery.

A. C. BARLER MFG. COMPANY, manufacturers of Barler's Ideal oil heater, Barler's shoe blacking stand, &c., have removed from 111-113 Lake street, Chicago, to 104-106 Lake street, almost opposite their old location. They are now in a modern building, with increased facilities for the dispatch of business, having three floors, each 40 x 150 feet. They invite their friends and patrons to drop in and inspect their fine new quarters. They have recently taken the wholesale agency for the lawn sprinkler made by the American

Ball Nozzle Company of New York. This nozzle is a mechanical wonder. It is bell-shaped and in it is loosely placed a small light ball. The force of the water does not dislodge the ball, as one would suppose, but impinging on the surface of the ball is broken into spray, with no back pressure on the hose. Shipments will be made from stock arrived in Chicago. The company will sell to the retail trade, but will also make terms to jobbers.

THE MICHIGAN STOVE COMPANY'S Chicago branch has lost the services of Charles Breasted, who has been obliged to resign on account of his health. Mr. Breasted enjoyed the distinction of being longest in the company's service among their traveling men. His resignation was therefore regarded as something more than an ordinary retirement of an employee. Manager Fred W. Gardner personally gave a lunch at the Chicago Athletic Association in his favor, inviting the rest of the company's traveling men to be present. On behalf of the company Mr. Gardner on that occasion presented Mr. Breasted with a handsome pair of diamond cuff buttons, while the rest of the traveling force gave him a diamond pocket. In his presentation speech Mr. Gardner dwelt on Mr. Breasted's long association with the company, expressing the hope that at no distant day he might be so refreshed by his rest from the cares of business that he might be inclined to resume active relations with the company. He assured Mr. Breasted that he could never entirely sever his relations with the Michigan Stove Company. Matt R. Bingham, the next oldest of the traveling representatives, made the presentation speech in behalf of the men. The remainder of the afternoon was spent in enjoyment of the facilities for entertainment found in the Athletic Association's world famous club house.

THE representatives of F. M. Borden & Bro., Philadelphia, present an embossed card bearing the autograph signature of the firm preparatory to discouraging on summer cooking stoves and refrigerators when they visit the trade.

R. F. HARVEY, who has for several years been head clerk in Barstow Stove Company's New York office, corner Beekman and Water streets, has severed his connection with that firm to undertake the retail business in Twenty-third street, near Seventh avenue.

Catalogue No. 11, issued by the Ferracut Machine Company, Bridgeton, N. J., is a striking publication in its red cover. The catalogue is apparently of the usual size, measuring 7 x 10 inches, but when the cover is turned back it is seen that the interior part is double that size, folded over in the middle. By this means opportunity is given for presenting large illustrations of the machines made by the Ferracut Company. The catalogue illustrates new designs of foot and power presses, lathe, benders, dies, &c., for the working of various kinds of bar and sheet metals, and describes over 300 sizes and kinds of presses, although but a portion of them are illustrated. The first illustrations relate to heavy inclined and upright presses; then comes their press C4, a heavy tool, weighing 3400 pounds. Parabolic presses follow; then presses with adjustable beds. Punching presses of various sorts, also special deep throat punching presses, embossing presses, coining presses, double-crank stamping presses, follow in the

order named. Then light pattern presses, heavy pattern presses, double action drawing presses come later, as well as many other special styles. Altogether it is a most interesting publication for those who are concerned with press work of any kind.

The Powell Gas Engine Lubricator.

The gas engine lubricator made by the Wm. Powell Company of Cincinnati, Ohio, is provided with a "signal" stop feed device, and has a novel method of packing the sight glass, thus dispensing with the usual stuffing boxes. With the signal lever C in a vertical position, as shown, the feed is regulated by the milled screw head E. Screwing

The Powell Gas Engine Lubricator.

this head up or down increases or reduces the flow. When once the desired rate is obtained the screw is locked by the joint nut D. The flow is started with the lever C up, and it can be instantly stopped by turning the lever down, without disturbing the regulation.

Trade Notes.

THE NICHOLSON FILE COMPANY, Providence, R. I., send out a small catalogue illustrating the Files, Rasps and tools which they manufacture. It begins with a table of contents and an alphabetical index. The varieties of Files shown in the pages that follow cover every possible need of the trade. The shapes are shown by illustrations and the names and dimensions are given. Various specialties are also noted at the end as well as a price-list.

THE GILBERT & BENNETT MFG. COMPANY, Georgetown, Conn., 44 Cliff street, New York and 148 Lake street, Chicago, have recently installed at their Georgetown plant new boilers of 250 horse-power capacity and a 150 horse-power engine. They now have six engines at Georgetown, besides an extensive water power. They have also recently added a new two-story build-

ing about 150 feet long and 40 feet wide, which is being utilized for storage and manufacturing. The company, having thus increased their facilities, are now prepared to make prompt shipments of their specialties, including poultry netting, window screen wire cloth, pearl wire cloth, G. & B. web wire fencing and galvanized wire cloth.

THE STRUTHERS IRON & STEEL COMPANY, recently organized at Youngstown, Ohio, and which concern have purchased the plant of Summers Bros. Company at Struthers, Ohio, are now enlarging the capacity of the mill and are also remodeling it. The concern have placed an order with the Lloyd Booth Company, Youngstown, Ohio, for one 34 x 40 inch sheet mill, the housings for which will weigh 11 tons. They have placed an order with the same concern for one large pair of squaring shears. The company have under erection new furnaces and a new warehouse, and are building a new foundation for sheet bar mill. They will make their own iron bars and will run one sheet bar furnace, two scrapers and a few puddling furnaces. They expect to have their plant in operation not later than May 15, and will make all widths and lengths of either steel or iron sheets. J. Warren, Jr., will be general manager and Jos. Patterson superintendent.

THE PARSONS Manganese Bronze & Copper Company, Olney, Philadelphia, are about closing a contract for an addition to their rolling mill, about 120 x 90 feet, in which to erect rod rolls and install new machinery for manufacturing bronze rods and for stamping purposes.

THE ANNUAL MEETING of the stockholders of the Joseph Dixon Crucible Company, Jersey City, N. J., was held Monday, April 15, at the company's general offices at Jersey City. The following Board of Directors was unanimously re-elected: E. F. C. Young, John A. Walker, Daniel T. Hoag, Richard Butler, William Murray, Alex. T. McGill, Jerome D. Gillett. After the stockholders' meeting had adjourned, the newly elected board organized and unanimously re-elected E. F. C. Young, president; John A. Walker, vice president and treasurer; George E. Long, secretary. The Joseph Dixon Crucible Company, established in 1827, manufacture Plumbago Crucibles, Graphite Facings, Retorts and other goods used in foundries and smelting works; Lubricating Graphite, Graphite Greases, Graphite Paints and Dixon's celebrated American Graphite Pencils, and Carburet of Iron Stove Polish.

THE W. S. TYLER WIRE WORKS COMPANY of Cleveland, Ohio, have recently added to their factory equipment a Jenney dynamo coupled directly to a high speed Russell engine. The dynamo is used for electric lighting and also generates current for 70 to 80 motors located in the machine shop, carpenter shop and wire weaving department. Each machine is run independently and the arrangement is stated to be extremely satisfactory. The works at present are very busy. The company are giving more attention than at any time to previous to decorative designing and architectural work, although they are and will continue to be very large makers of poultry netting, window screen cloth, wire cloth for mining machinery and other woven wire fabrics.

TRADE REPORT.

The Iron Market.

Reports are conflicting and reflect a somewhat mixed condition of affairs. While many in the Iron trade are very sanguine of an early recovery, there are many doubters. Buyers who are being offered material at old prices listen to stories of a rising market with much suspicion. While some talk of a further advance in Coke after July, others insist that even the recently fixed prices are not being really obtained. In Ore there are rumors of an early further advance of 10¢ @ 15¢ a ton.

The rise in Oil will probably force those rolling mills which have used it as fuel for reheating furnaces to go over to producer gas, and will probably not affect cost seriously. The Oil excitement is sure to stimulate the demand for Wrought Pipe and for Skelp, and in that way will do the Iron trade some good. We may note in this connection a sale of 7000 tons of Hoops for oil barrels.

In Foundry Pig Iron there has been quite a good deal of activity all over the country and the Southern furnaces have booked quite heavily. The majority of them have sold all they cared to place at the low figures recently prevailing and have withdrawn them. They are now asking higher prices, but have not got them yet so far as we can learn.

Pig Iron.—The market has been quite active, notably throughout New England, the Virginia, Alabama and Northern furnaces participating in the movement. Sales were made on the basis of the low prices recently prevailing, but now quite a number of sellers have withdrawn. The market is firmer, but is not yet notably higher. We quote \$12 @ \$12.50 for No. 1; \$10.75 @ \$11.55 for No. 2, and \$10.25 @ \$10.50 for No. 3 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.25 @ \$11 for No. 2; \$10 @ \$10.50 for No. 3; \$10 @ \$10.25 for No. 2 Soft, and \$10.50 @ \$10.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.50 @ \$10.

The demand for Foundry Irons is reported as steadily improving in the Philadelphia market, and although some Irons are held at a slight advance, buyers seem to get what they need at the old prices. The biggest advance claimed from the very lowest point is only 10¢ per ton on Southern Irons, and at inside figures 500 and 1000 ton lots could readily be secured to-day. There is no doubt the demand is better, and, with higher prices asked for Pennsylvania Irons, Southern brands have a better chance than they have had for months past. Sales have been quite large recently, inside figures being the rule, however, which, for Philadelphia, are as follows, and 30¢ @ 50¢ less for deliveries at points within 100 miles South or West:

Standard No. 1 Foundry X.....	\$12.00 to \$12.50
Standard No. 2 Foundry X.....	11.25 to 11.50
No. 2 Plain.....	10.75 to 11.00
No. 1 Soft.....	11.50 to 11.75
No. 2 Soft.....	10.75 to 11.00

The business of the past week in the Chicago Pig Iron market was not

so large in volume as that of the previous week, but was nevertheless of a healthy character, showing a continuance of the buying movement. The demand for local Coke appears to be excellent, although no large contracts have recently been made. Orders are steadily refused at anything under makers' regular prices. Business in Southern Coke Iron was quite heavy, one contract having been placed for 1600 tons and several others for good quantities. Concessions can no longer be obtained, and furnace companies are repudiating sales made under their authorized figures instead of quietly accepting them, as had been their custom. The market looks very much better. Lake Superior Charcoal has recently been more active, and season contracts are becoming more numerous. Quotations are as follows, for cash:

Lake Superior Charcoal.....	\$12.75 to \$13.00
Local Coke Foundry, No. 1.....	10.50 to 10.75
Local Coke Foundry, No. 2.....	10.25 to 10.50
Local Coke Foundry, No. 3.....	9.75 to 10.25
Local Scotch No. 1.....	10.50 to 11.00
Ohio Strong Softeners, No. 1.....	13.00 to 13.50
Southern Silvery, No. 1.....	11.75 to 12.00
Southern Silvery, No. 2.....	11.50 to 11.75
Southern Coke, No. 2.....	10.00 to 10.25
Southern Coke, No. 3.....	9.50 to 9.75
Southern, No. 1, Soft.....	10.00 to 10.25
Southern, No. 2, Soft.....	9.75 to 10.00
Alabama Car Wheel.....	17.50 to 18.00
Jackson County Silvery.....	15.00 to 15.25
Other Ohio Silvery.....	14.25 to 14.50

There have been numerous sales of Pig Iron in the Cincinnati district during the week, and, in the aggregate, the tonnage has been quite heavy. There is, however, no real change in the statistical position other than that the furnaces are better provided with orders both for present and future delivery extending into the summer and fall months and therefore feel more independent and are seeking a solid foundation upon which to advance prices, especially for Southern makes. In fact, during the past few days many orders for Foundry grades have been "turned down" by producers in the South, who are regarded as occupying stronger and more independent positions than at any time during the past year. At the close there were several large buyers in the market who seek the placing of contracts of importance, but the market is found extremely firm even for round lots and long deliveries. One Southern Pipe works has been in the market during the week, but has placed its order direct with Southern furnaces. Quotations are given as follows:

Southern Coke, No. 1.....	\$9.75 to \$10.00
Southern Coke, No. 2.....	9.00 to 9.25
Southern Coke, No. 3.....	8.50 to 8.75
Ohio Soft Stone Coal, No. 1.....	14.50 to 15.00
Ohio Soft Stone Coal, No. 2.....	14.00 to 14.50
Lake Superior Coke, No. 1.....	11.75 to 12.25
Lake Superior Coke, No. 2.....	10.75 to 11.50
Hanging Rock Charcoal, No. 1.....	16.00 to 16.50
Hanging Rock Charcoal, No. 2.....	15.50 to 16.00
Tennessee Charcoal, No. 1.....	13.00 to 13.50
Tennessee Charcoal, No. 2.....	12.00 to 12.50

A steady increase is noted in the demand for Pig Iron in the St. Louis market. Sales of carload lots are giving way to sales of from 100 to 500 tons, and prices are firmer in consequence. The increased number of inquiries now in the market indicates a decided interest on the part of the consumer. There is an undertone of strength to the market which

seems to have demonstrated itself to consumers, and they are now more anxious to anticipate their wants than they have been for months past. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry.....	\$10.00 to \$10.25
Southern Coke, No. 2 Foundry.....	9.50 to 9.75
Southern Coke, No. 3 Foundry.....	9.00 to 9.25
Southern Car Wheel.....	16.00 to 16.50

A slightly better demand is reported in the Pittsburgh district, but prices show very little improvement. Quotations are as follows, for cash:

No. 1 Foundry.....	\$10.25 to \$10.50
No. 2 Foundry.....	9.75 to 10.00

Metal Market.

Pig Tin.—The advance in wholesale prices last week has been well maintained and a further gain made, with but little intermediate reaction. In short, the market has shown a remarkably strong tone in the face of more or less bearish influences brought to bear by some prominent operators and apparently determined effort to force values downward. The fact is recorded that shipments from the Straits during the first half of April were quite large, amounting to no less than 2440 tons, including 1800 tons to London, 110 tons to the United States, and 530 tons to the Continent. The additional fact is noted that no less than 1535 tons have arrived here since the beginning of the month. The somewhat ancient story is brought out that considerable accumulation of stock at primary sources of supply has taken place in the not very far distant past. The more substantial fact remains that operators on the "bull" side of the market have been the most aggressive, and carried matters their way to a great extent in the face of seeming adverse conditions. The consumptive demand has been good, and retail prices for small lots from stock have advanced about ½¢ per lb, Straits Pig being quoted to jobbers at 15½¢ @ 15¼¢, and Banca at 15¼¢ @ 16¢ per lb. At the close of the week, prices began to show some indications of weakening, the higher rates barely holding their own.

Copper.—The market has been moderately active and prices have undergone a further advance. The upward movement has affected Lake Ingot, Electrolytic and casting stock alike. Liberal engagements on former contracts, leaving only moderate stock available for early deliveries, seem to be the main stimulating influence to values. Some support comes, however, from the fact that former pressure by some dealers has been withdrawn, temporarily at least. No change has been made in quotations for small retail parcels, which remain on a basis of 10½¢ for Lake Ingot. The demand from consumers is hardly more than moderate.

Sheet Copper.—The movement in manufactured Copper has been rather more brisk this week. Some good sized orders for Cornice Copper which have been pending for some time have been placed, and the feeling among con-

sumers appears to be more healthy. Individual orders do not, however, reach the proportions generally looked for. Inquiry is active and the outlook for a good late spring and early summer trade is regarded as favorable. Mills are all reported to be busy on orders, present and prospective, but prices do not yet show any signs of improvement. Should the advance in raw material be maintained, however, the price of Sheet Copper is not unlikely to advance in sympathy before long. Small lots of Sheet Copper from store are quoted at the net list prices of 14¢ $\frac{1}{2}$ lb.

Pig Lead.—The market is very quiet, and a few sales of Common Western for early shipment have been made at a slightly lower figure than last week. This decline was partly under the influence of some bearish pressure at the West and partly due to lower rates on eastbound freight. The undertone of the market at the close was weakish. The price for small lots of American Pig from store rules at the same level it has held for some weeks past—viz., 3½¢ @ 3¼¢ $\frac{1}{2}$ lb.

Lead Pipe and Sheet.—The arrival of spring and the resumption of building operations have infused rather more activity into the demand for Manufactured Lead. The volume of business does not yet, however, come up to expectations. Nevertheless the outlook is regarded as hopeful for a good summer trade. Prices in this section are maintained on the list basis of 5¼¢ for Pipe and 6¼¢ for Sheet with a discount of 20 %.

Spelter.—A moderate business only has been effected, and the demand has shown no increase in vigor or volume. Wholesale prices have stiffened somewhat, however, chiefly under the influence of favorable advices from the West. Small parcels of good Western brands from store rule at 3¼¢ @ 4¢ $\frac{1}{2}$ lb.

Antimony.—No change in prices has taken place, but the market is rather weak. In small lots Hallett's is quoted at 8¢ and Cookson's at 9¼¢ @ 9½¢ $\frac{1}{2}$ lb.

Tin Plate.—As regards wholesale business the market continues unusually dull, although the volume of trade in 100-lb Cokes and other light Plates has been somewhat larger than that of last week. There has been quite a marked gain, however, in the smaller kind of jobbing orders, and some improvement is evident in the size of individual purchases—the hand to mouth system being not so prominent as heretofore. Roofing Plates are in much better demand than they have been, showing that building and repairing are beginning to be actively prosecuted with the advent of milder spring weather. Nevertheless, upon the whole the market remains flatter than usual at this time of the year, with prices rather weak. The block in Welsh Tin Plate production has caused many makers of well-known foreign brands to suspend quotations. This circumstance is offset, however, by increased offerings of American Plates of equal grades at very close to the prices asked for imported. Stocks in hand are fairly liberal, and it is said that a considerable quantity of Plate is held on consignment by banks, &c., which may at any time be placed on the market at bottom rates. These factors, it is thought, preclude the prospect of any present improvement in prices.

A special London cable dispatch of April 17, to *The Iron Age*, reports on the British Tin Plate market as follows:

Tin Plate has been quiet. Business at the quarterly meetings was light, owing to divergent views of makers and merchants and lack of buyers. Outside there was more inquiry for May delivery, and makers' prices for the same are higher. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, 1C 14 x 20	9/3	②	
Siemens Cokes, 1C 14 x 20	9/6	②	
Terns, 20 x 25	18/-	②	2½
Charcoals, 1C 14 x 20	11/-	②	13/6

Sheet Iron.—Prices for both Black and Galvanized Sheets have put on additional strength during the week. The irregularity in this respect which has for so long characterized the market has quite disappeared, and prices are now quite firm, especially for Sheets of standard quality. The report on Thursday that the manufacturers of Sheet Iron, in session at Pittsburg, had agreed to advance rates on Black Sheets ½¢ $\frac{1}{2}$ lb, served to send the jobbing prices up correspondingly in the New York market, where small lots of No. 27 Common Iron are now quoted at 2.70¢ @ 2.75¢ $\frac{1}{2}$ lb. Galvanized Sheets are also stronger, and quotations for small parcels are given by jobbers at 75 and 5 % @ 75 and 10 % off, according to size of order and conditions of delivery. The demand for Galvanized is quite active and mills are so full of work that they are not generally inclined to consider deliveries into the summer months at current prices. There is considerable talk of an early advance in the prices of Galvanized Sheets, and the idea seems to have more foundation than previous expectations in this direction.

Chicago Report.

Scrap.—The movement is heavier. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap.....	\$6.50	
Machinery Cast.....	5.50	
Malleable Cast.....	5.00	
Stove Plate (free of burnt).....	4.00	
Burnt Iron and Grate Bars.....	3.00

CONDITION OF THE

Hardware Trade.

A BETTER TONE characterizes the market, and the trade, with a fair volume of business, are anticipating a steady movement of goods, with a gradual increase in volume. While business is somewhat spasmodic, orders are coming in with a reasonable degree of freedom, but are for the most part small and carefully assorted, with a considerable proportion of reasonable goods. The indications, however, point to an increase in building, and there is accordingly an improved demand for Locks and Builders' Hardware generally. In the matter of prices there is little change. There is a disposition on the part of manufacturers in many leading lines to refrain from making concessions, and in some instances to withdraw some extreme prices. The improved tone of the market in raw material and the possibility of a further strengthening in prices at any time has some effect on the market and manufacturers of some heavy goods especially are hoping that it will be feasible to announce slightly advanced prices in the near future. The trade generally are watching the market closely, with a view to discovering the first indication of a return to better prices, but are not as a rule placing orders very freely in anticipation of such a turn. There is some irregularity in the market owing to the extent to which some leading jobbing houses are cutting prices in such lines as Nails, Barb Wire and Carriage and Machine Bolts, in the prices of which advances have recently been made by the manufacturers. In these lines the jobbers are underselling the makers of the goods and inducing a good deal of demoralization, which is to be regretted from its effect not only upon the lines in question but upon the tone of the market in general. Manufacturers and the trade generally are free in expressing their regret that the jobbers think it advisable to take this course, when if prices were maintained they would have an opportunity of realizing a satisfactory profit on their earlier purchases. There is little reason for complaint in regard to collections, which are somewhat sluggish, but on the whole the financial condition is fairly satisfactory.

Adices from Chicago.—The Shelf Hardware trade is continually growing; the volume of business last week was better than for any previous week this year. Some houses report having all the trade they can handle with present facilities. Others, however, while expressing gratification at the continuous improvement, say that they would be able to take in considerably more. While the volume of business has thus grown in the aggregate, the character of trade remains the same as before, running almost entirely to small lots, the exception being only in the case of new stocks, which are still pleasantly frequent. Hardware merchants through the country manifest their chronic conservatism in ordering goods. Low prices will not induce them

to anticipate their requirements. Even the low prices on staple articles which are prevalent have not induced them to lay in large stocks of such commodities. Jobbers are advising their correspondents that this is a good time to lay in stocks of miscellaneous Hardware, but only such as they are able to pay for, in view of the increasing cost of raw material. They are of the opinion that as the year advances the demand will grow larger and a sudden appreciation in value may at any time be expected. The business in seasonable goods is proceeding on the same lines as in straight Hardware. Merchants are only buying such quantities as they need from day to day or week to week. This condition of trade is expected to cause the usual spring demand to extend well into the summer. Tin Plates are very active and Roofing Plates are in much better demand than they have been, showing that building and repairing are now being well prosecuted. Collections are fair, but might be considerably better.

Notes on Prices.

Wire Nails.—The Wire Nail market is characterized by but little change in the volume of business since our last report. The trade are purchasing in moderate quantities, except in a few instances where some large orders have been placed. The mills are well occupied on orders and refer to the aggregate of business as satisfactory. Prices are not quite so strong as a week ago, some of the manufacturers making concessions on quotations previously current. The prices for small lots from store in New York are held at \$1.10 to \$1.15.

Advices from Chicago.—The market for Wire Nails is seriously demoralized. This is attributed more to jobbers than to manufacturers. Another cut has been made by one of the local jobbing houses, who offer carload lots or less than carload at 90 cents, f.o.b. cars Joliet. After this cut was made a competing house named 80 cents. These prices are below the rates recently made by manufacturers, and it is asserted that some of the jobbers are selling below cost. If this is the case they are remarkably generous to their customers. The manufacturers' prices are 95 cents, Chicago, or its equivalent for carloads and \$1 for small lots. Manufacturers report a number of large transactions during the past week in which sales were made covering shipments extending into the summer.

Cut Nails.—The Cut Nail market is in a better condition than Wire Nails, the prices adopted by the Eastern manufacturers being quite well maintained. The volume of business is fair, though not especially heavy. Quotations for small lots on dock or from store in New York, 90 cents

Advices from Chicago.—Manufacturers report a steady continuation of trade in this branch. Their orders run along in about the same volume weekly and are said to be satisfactory considering all circumstances. Jobbers quote small lots from stock at \$1.

Barb Wire.—There is a free movement of Barb Wire and there is little ground for complaint in regard to the volume of business. There is, however, a slight irregularity in the matter of prices and the tone of the market is not quite as strong as a week or two ago. Quotations are on the basis of

\$1.80 to \$1.85 for carload lots of Four-Point Galvanized at mill, but it is intimated that under special circumstances the lower figure can be slightly shaded. The effect of the cut prices announced by prominent jobbing houses has some influence in weakening the general tone of the market.

Advices from Chicago.—Manufacturers report a very heavy business in progress. The demand for which they have been long looking appears to be in full swing. Everybody desires shipments made very promptly, showing that they are out of stock. Notwithstanding the heavy trade which is now moving, the Chicago jobbers have inaugurated the same movement in Barb Wire which is introduced in Wire Nails. They are quoting f.o.b. cars, Joliet, in carload lots or less, \$1.50 for Painted Wire and \$1.85 for Galvanized. Other jobbers have named \$1.49 and \$1.84 in competition with the cut prices. Manufacturers state that their carload price is above the figures now named by the jobbers. The situation is perplexing, especially in view of the advance in steel billets and the stiffening in wire rods, which might be expected to have an effect on the finished product.

Nunmyr Nozzles.—H. F. Neumeier, Muncie, Pa., manufacturer of the Nunmyr Nozzles for garden, pump, factory, mill, furnace and fire hose, advises us that he has reduced the price on the Nozzles to \$40 per gross, net. The Nozzles are packed in neat, hinged wood boxes, 1 dozen in each. He states that owing to the large quantity of ½ inch Nozzles sold, and orders in hand, he has enlarged his manufacturing facilities.

Can Opener Carpet Tacks.—The Can Opener Carpet Tacks, manufactured by the Grand Crossing Tack Company, Grand Crossing, Chicago, an illustrated description of which appeared in our issue of last week, are sold to the trade at \$4 per gross net.

Dish Drainer.—The Magic Dish Drainer put on the market by the Leach Roaster & Baker Company, Paxton, Ill., was described in our issue of the 13th inst. The Drainer is sold to the trade at \$1.75, subject to a discount of 40 per cent.

Glass.—A weekly increase is reported in the amount of Glass shipped, though the volume of business is not yet large. The demand is not likely to be larger than the supply up to the time of the annual shut down, as it is estimated that about 13 weeks' supply of Glass is in manufacturers' hands, which will not probably be called for until jobbers' stocks are depleted. The better feeling which is pervading trade generally is likely to have a salutary effect upon the Glass market, and the belief is expressed that prices are destined to become firmer. A discount of 80 per cent. for single and 89 and 5 per cent. discount for double strength Glass, in car lots, seems to be fair representative quotations. It is reported that all quotations on Plate Glass have been withdrawn, and that prices will be announced by the Pittsburgh Plate Glass Company in a few days.

White Lead.—Jobbers have had a livelier market for Lead in Oil, and manufacturers report a brisker movement also. Upon the whole the distribution would appear to be fully up to the average for this season of the year. The movement in Dry Lead has also been somewhat freer. Prices stand as

they have been for some time past and generally quite steady.

Red Lead.—Foreign makes for future shipment are held at rather higher prices, but goods on the spot are moved at old rates. There is a fairly active business in both foreign and domestic.

Old Metals.—The demand is somewhat better, but so far no quotable improvement in prices has developed. Dealers' purchasing prices for moderate sized lots, New York delivery, are approximately as follows:

Heavy Copper.....	lb 7 ¢
Light and Tinned Copper.....	lb 6 ½ ¢
Heavy Brass.....	lb 4 ½ ¢
Light Brass.....	lb 3 ½ ¢
Lead.....	lb 2 ½ ¢
Tea Lead.....	lb 2 ½ ¢
Zinc.....	lb 10 ¢
No. 1 Pewter.....	lb 5 ½ ¢
No. 2 Pewter.....	lb 5 ½ ¢
Wrought Scrap Iron, gross ton.....	\$7.50 @ \$8.00
Heavy Cast Scrap..... gross ton.....	7.50 @ 8.50
Stove Plate Scrap..... gross ton.....	5.00
Burnt Iron..... gross ton.....	3.00

Old Rags, Paper, &c.—The general condition of the market is unchanged, and dealers' purchasing quotations do not vary from those made last week, namely:

No. 1 White Rags.....	lb 3 ¢ @ 3 ½ ¢
No. 2 White Rags.....	lb 2 ½ ¢ @ 2 ¾ ¢
Mixed Rags.....	lb 1 ½ ¢ @ 1 ¾ ¢
Blues and Sds.....	lb 1 ½ ¢ @ 1 ¾ ¢
Hard Sized White Shavings.....	lb 2 ½ ¢ @ 2 ¾ ¢
No. 1 White Book Shavings.....	lb 1 ½ ¢ @ 1 ¾ ¢
No. 2 White Book Shavings.....	lb 1 ½ ¢ @ 1 ¾ ¢
Light Book Shavings.....	lb 1 ½ ¢ @ 1 ¾ ¢
No. 1 Mixed Shavings.....	lb 1 ½ ¢ @ 1 ¾ ¢
No. 2 Mixed Shavings.....	lb 1 ½ ¢ @ 1 ¾ ¢
No. 1 Printed Books.....	lb 1 ½ ¢ @ 1 ¾ ¢
Ordinary Mixed Books.....	lb 1 ½ ¢ @ 1 ¾ ¢
Newspapers.....	lb 1 ½ ¢ @ 1 ¾ ¢
No. 1 Manila Paper.....	lb 2 ½ ¢ @ 2 ¾ ¢
No. 2 Manila Paper.....	lb 2 ½ ¢ @ 2 ¾ ¢
Bogus Paper.....	lb 1 ½ ¢ @ 1 ¾ ¢
Common Paper.....	lb 1 ½ ¢ @ 1 ¾ ¢
Straw Chips.....	lb 1 ½ ¢ @ 1 ¾ ¢
Binders' Clippings.....	lb 1 ½ ¢ @ 1 ¾ ¢
Jute Butts.....	lb 1 ½ ¢ @ 1 ¾ ¢
No. 1 Jute Bagging.....	lb 1 ½ ¢ @ 1 ¾ ¢
Mixed Bagging.....	lb 1 ½ ¢ @ 1 ¾ ¢
No. 2 Bagging.....	lb 1 ½ ¢ @ 1 ¾ ¢
Hemp Twine.....	lb 2 ¢ @ 2 ½ ¢
Manila Rope.....	lb 1 ½ ¢ @ 1 ¾ ¢
Jute Rope.....	lb 1 ½ ¢ @ 1 ¾ ¢
Mixed Rope.....	lb 1 ½ ¢ @ 1 ¾ ¢

Old Rubber.—An irregular market is reported. The following quotations represent about the current prices paid by New York dealers:

Car Springs, ton lots, f.b. 3 ¢ @ 3 ½ ¢
Rubber Shoes, carloads, delivered at factory, f.b. 4 ½ ¢ @ 4 ¾ ¢
Rubber Shoes, less than carloads, f.b. 4 ¢ @ 4 ½ ¢
White Wringer Rolls, f.b. 3 ½ ¢ @ 3 ¾ ¢
White Syringes, f.b. 3 ½ ¢ @ 3 ¾ ¢

THE D. R. & H. AUTOMATIC MFG. COMPANY of New York City have been chartered to manufacture automatic refrigerating and heating apparatus and machinery. The capital of the concern is placed at \$300,000, and the directors named are: David M. Demarest, Albert N. Romaine, E. C. Howell, E. W. Howell of New York City and T. L. Hume of Long Island City.

THE ADVERTISEMENT of the Troy Paint & Color Works, 677-679 River street, Troy, N. Y., directs attention to the American Seal Builders' and Roofers' Elastic Oil Cement for bedding slate and tile roofs, for vault lights, for metal roofs and for brick and stone fronts. These are some of the purposes of the cement, the application of which is graphically shown in the announcement.

A New England Trades School.

In another column will be found some interesting particulars relating to the trades school of the Springfield Industrial Institute of Springfield, Mass., which will afford gratification to those of our readers who are interested in the trade school movement in this country. Started last year in an unostentatious way, the Springfield school attained in its first season such a measure of success as to justify its managers in extending its next season's field of work very largely. The experience of this school is in line with that of all other similar institutions for trade education previously established in the East. These schools have proved uniformly successful wherever they have followed, as in this instance, the general plan embodied by the late Colonel Auchmuty in the now famous New York Trade School. By this system young men are helped to help themselves. Nothing is given for nothing, and the fees, without overburdening the pupils' resources, are placed at a sufficient height to make it an object for the student to get his money's worth of instruction in return. The provision of both day and night classes, whereby are reached not only the beginners in the trades, but also those already working at them for their daily bread, is another feature of the Auchmuty system which has, in its results, proved the wisdom and foresight of the originator of the modern American trade school.

Ash Bag System in New York City.

At the suggestion of Colonel Waring, Commissioner of Street Cleaning of New York City, the Board of Health has ordered the adoption of a new system of collecting ashes, upon which the Street Cleaning Department has been experimenting for the last two or three weeks. The householders in Thirty-

eight street, between Fourth and Sixth avenues, were persuaded to give the plan a trial. For this purpose, 150 canvas bags were furnished by the department, each bag containing about as much as an ordinary ash can. When placed in the house, this bag is dis- tended by the insertion of a light zinc or galvanized cylinder, similar to an ash can, but without bottom. When the bag has been filled with ashes, the cylinder is drawn cut by the collectors of the Street Cleaning Department, the top of the bag is closed tight and the bag is carried to a wagon. Another bag is left, into which the cylinder is slipped. By this process, no part of the ashes is permitted to fall on the ground, all flying of dust is prevented, and unsightly rows of ash barrels along the streets are done away with. Moreover, the bags can be piled up in the collecting wagon, increasing its capacity to nearly double, and the dropping of ashes from the wagon on its way to the dump is entirely obviated. The experiment was regarded by the householders concerned, and those who witnessed it, as an entirely successful demonstration of the efficiency of the system, and the Health Board has approved the general adoption of these bags. The Health Department has also issued stringent orders to householders, directing the separation of garbage and ashes. For the accommodation of garbage, an iron bucket with tight fitting lid, costing about the same as a galvanized ash can, has been recommended; and the use of this utensil will probably be rendered mandatory in future. By these means, it is evident that the collection and removal of garbage and ashes will be greatly facilitated, and the operation rendered far less objectionable than heretofore.

Ten-Cent Dinners.

Edward Atkinson, the distinguished economist, of Boston, has been recently exploiting his "Aladdin" oil lamp oven in the national capital. According to published accounts Mr. Atkinson entertained a distinguished company at dinner one evening last week in Washington, including three cabinet ministers, a foreign diplomatist and other persons, to the number of fourteen. His oven was placed on one side of the dining room; and, although an entire dinner had been cooking in it for some hours, it was said that no perceptible odors could be detected by the guests. The dinner furnished was a full one of seven courses, from fish to dessert, and it was voted an entire success by those who partook of it. The

entire dinner for fourteen persons was provided at a cost of ten cents for the fuel, supplied by an oil lamp; and its total cost is said to have reached a little over \$1.50. Mr. Atkinson undertook this entertainment with a view of demonstrating the fact that people can live a great deal cheaper than they do. Incidentally, of course, he wished to bring to notice the undoubted merits of his invention, the "Aladdin" oven, which he has for some years been endeavoring to present to the public. It is clear that he has invented a method of cooking of surprising simplicity and economy, the only fuel being a common lamp filled with kerosene oil, lighted and placed within the oven. The majority of housekeepers, however, are so wedded to old methods that it will take a little more than a "cabinet dinner," at ten cents a head, to convince them that they are spending far more on the actual costs of living than there is any necessity for. Mr. Atkinson's object lesson may not, however, be entirely thrown away. It is said that the Secretary of Agriculture, who was one of his guests, was so struck with the entertainment that he may institute a special investigation into the necessary cost of prepared food in this country, with the view of publishing the information gained.

Col. Carroll D. Wright, United States Commissioner of Labor, announces that he will issue in July the first number of the new Labor Bulletin authorized by Congress, the appropriation for the bulletin becoming available with the coming fiscal year. Colonel Wright, in the new publication, intends to adopt some of the best features of the labor bulletins issued by the governments of Great Britain, France, Russia and New Zealand, and will introduce new features which, he believes, will make the bulletin the best official publication of its kind in the world. He proposes to make original investigations on topics which, while of great interest, are not important enough to fill a volume of his annual report and to embody the results in the bulletin.

Five hundred garment workers employed in various sweat shops in St. Louis, Mo., inaugurated an entirely justifiable strike last week. They do not ask for higher wages, but demand that their employers provide for them clean shops in which to work, fresh air and proper sanitary conveniences.

The Standard Oil Company are about to remove their northwestern distributing plant from Chicago to a location on Lake Superior, between Duluth and Superior. They are also building a line of steamers specially constructed for oil transportation, which will be placed in service soon after the opening of navigation on the lakes.

THE LETTER BOX.

Folding Camp Equipments.

From F. M., Baltimore, Md.—In *The Metal Worker* of April 20 is an inquiry from "H. A. S.," Grangerville, Idaho,

had a call from some one who is thinking of a trip into the woods the coming summer. With regard to the bake oven I would say that a convenient one is illustrated in Fig. 1 of the sketches,

and C so as to fold. Two legs are required for holding the back in position, one of which is shown at E. The legs are secured to the back of oven as shown at F, a rivet being used so the leg can be turned out of the way when the oven is folded. In the front elevation is shown the position of ends when the oven is folded. The two ends are hinged to the top, as indicated at G H, and fold over, as indicated by H J' and

Fig. 1.—Folding Bake Oven.

Fig. 2.—End Elevation and Plan of Folding Open Stove.

Fig. 3.—Various Views of a Folding Closed Stove.

FOLDING CAMP EQUIPMENTS.

relative to bake ovens and folding camp stoves which I will endeavor to answer. It is well known that these articles are requisite adjuncts of a camp outfit, and it is to be assumed, therefore, that the correspondent making the inquiry has

and although certain dimensions are given the oven can be made any size that may be desired, retaining, of course, the same relative proportions. Let A B C D represent the end elevation of the oven, which is hinged at B

G K'. For the purpose of holding the dripping pan in position, narrow cleats are riveted to the ends at L M, and by having the ends of the pan flanged it slips on the cleats, as shown. The end H J is first folded over, as indicated by

H J', and that the end G K should fold over and be level the end of top is bent up about $\frac{1}{4}$ inch, as shown at G, so the end G K will lay as indicated by G K'. The folding ends can be secured to the bottom by riveting loops on each and running a wire through. The hinges are made in the usual manner, by notching the edges before turning for wire. After wiring, strips of tin are passed

Another form of folding stove is shown in Figs. 4 to 6, and can be made the size indicated in Fig. 3. In Fig. 4 is presented an end elevation or section. The top and bottom edges of sides A and B are bent out at right angles, and the side edges of top and bottom are turned over so as to hold the sides. In the side elevation, Fig. 5, end D has its top and bottom edges turned out to re-

cumulated in 10 days' time and when snow covered the ground. My residence is in an open lot remote from any factories, and hence the air is less laden with soot than in more compactly built districts or in the vicinity of factories. It is a self evident fact that if a furnace is properly put in and properly managed there can be very little, if any, dirt come from the furnace, but it is brought

Fig. 4.—End Elevation of Another Form of Folding Stove.

Fig. 5.—Side Elevation.

Fig. 6.—Plan View.

FOLDING CAMP EQUIPMENTS.

through and bent over, when the strips are riveted to adjoining parts.

A form of open folding stove or broiler is shown in Fig. 2. In the end elevation A B represents the top of the stove, and C A, B D the legs, which fold, as indicated by the hinges at A and B. The frame of stove is indicated in plan by E F J I, and is formed of strips of band iron, riveted at the corners. A brace or strip, as G H, can be used if desired. Holes are made in E F and I J, through which wires are passed and the ends bent over on the under side, thus forming a level top. This form of stove is to be used over an open fire, is adapted to broiling, or any cooking utensils can be placed on the top. Legs can be fastened at E F G H I J, as shown in the end elevation.

A form of folding stove is shown in Fig. 3, and, as indicated, the top is 12 x 27 $\frac{1}{2}$ inches and the stove is 11 inches in height. There are two 8 inch gridle holes and an opening for a 4 inch smoke pipe in the top. The smoke pipe can be made tapering so the joints will telescope, and a flange can be riveted about the end that joins the stove so it will slip in only a short distance. The edges of the openings can be wired and the covers made in a manner similar to pall covers, having flat tops and rings. Sides A and B are hinged to the top and ends C and D to the ends of side B. To close the stove side A is folded under the top, the hinges being arranged as shown at a and a'. Side B is then folded on to the top, the hinges being made as shown at b and b'. The ends then fold on side B, the hinges being arranged as at a and a'. The usual door and draft damper are to be provided in end D. All edges are to be wired. If desired the top can be made about 1 inch longer than indicated, so as to project over the two ends. By making the opening for the smoke pipe oblong the length of the stove can be reduced about 2 inches. Camp stoves can be without a bottom, being set on the ground, but if a bottom is desired it can be made by turning the edges of a piece of iron so the stove will set in same. Legs can be added, as directed for Fig. 2.

ceive the ends of top and bottom, which are turned over. End C has its top and bottom edges turned in, so as to allow the top and bottom to be slipped over them. In the plan, Fig. 6, it is shown that the sides have their ends bent in, and flanges riveted on, as at e f g h, so as to hold the ends C and D in position. It is also shown that sides A B and end D have the top and bottom flanges bent out, as in Figs. 4 and 5. Legs can be applied, as shown in Fig. 2. As this form of stove is made without hinges, turned edges only being used, less labor is required in its construction than for the one shown in Fig. 3.

Common Sense Dust Inhibitor.

From HENSON ROBINSON, Springfield, Ill.—In *The Metal Worker* of February 2 your correspondent "J. L." of Pittsburgh requests information as to draft arresters for cold air ducts. I am pleased to relate my experience, believing I have the best article of the kind in the

into the house on the dirt and soot laden atmosphere from our own and neighbors' chimneys. Hence, if we can sift, filter and purify, as it were, the air, take from it the soot and dust before it reaches the furnace, we have overcome the greatest and perhaps the only drawback to hot air heating; also prevent damage to carpets, curtains, pictures, furniture, bric-a-brac, walls, &c. (no small tax), besides the annoyance and discomfort. To make an appliance available for general use in cold air ducts, especially where unskilled hands have the management of it, it must be simple to comprehend, removable for cleaning, durable and inexpensive and readily adjustable to any air duct. All these points are covered, I think, by the Common Sense Dust Inhibitor, a picture of which is shown, giving a perspective view of same, a part of the top and side of the air duct being broken away so as to show the position of the inhibitor within the air duct. The inhibitor is inclined toward the outer end of the air duct at an angle

Common Sense Dust Inhibitor.

market. About one year ago I purchased from J. La Forest King of this city what he calls a Common Sense Dust Inhibitor for my furnace, he estimating that it would prevent from eight-tenths to nine-tenths of the soot and dust in the air passing into the house. My experience with it has proven his estimate to be well founded. It accomplishes the desired result. The amount of dust and soot it collects is marvelous. The last time I cleaned it I got a cup full of fine black soot, smut, which ac-

of about 30°, thus giving less resistance to the air and a larger superficial area of mesh to arrest the soot and less vibration than if set vertically. It can be removed and cleaned and returned to place in three minutes, and there is nothing to get out of order. The inventor has adopted a hairy fabric for the webbing which not only arrests such pieces of soot as will not pass through the meshes, but the finer particles of dust and soot are caught on the hairs that point in all directions

from the fabric. This to my mind is a most important feature. With proper usage a web should last two seasons. When worn out the mode of attaching it to the frame is so simple that a new web can readily be inserted. I trust this will prove of interest to your readers.

Two Water Backs and One Boiler.

From E. A. W., West Burke, Vt.—Which is the better way of connecting two ranges with one boiler—should there be a separate pipe from the water back in each range to the boiler, as

Two Water Backs and One Boiler.—Fig. 1.—Separate Boiler Connections.

shown in Fig. 1, or will they give good service if connected at the boiler with a "Y," as shown in Fig. 2? I have two ranges, one on either side of a partition, with a boiler between them, and I purpose running a $\frac{3}{4}$ -inch pipe from the water back to a $1\frac{1}{4}$ -inch Y, which I shall connect at the boiler. In either case the boiler will be set close to the ranges.

Note.—We shall be glad to have our readers comment on this question. It will be more expensive to make separate

Fig. 2.—Branch Connection.

connections from each water back to the boiler, and it would seem as if there would be no objection to using the $\frac{3}{4}$ -inch pipe from the water back to the Y on a $1\frac{1}{4}$ -inch pipe to the side and bottom of the boiler or a 1-inch pipe, as it is probable that a larger pipe could not be used in an ordinary boiler.

A Balky Furnace.

From AUF WIEDERSEHN, Watertown, N. Y.—In answer to communication from "J. H. W.," Bridgeport, Conn., whose letter appears in *The Metal Worker*, April 20, I want to say, we often hear the remark "There is nothing so whimsical as a woman," but after 30 years of experience at furnace work I have come to the conclusion that there is nothing so whimsical as a furnace. The truth of the matter is, they have got to be humored. A great many house owners consider them a necessary evil. They want all the comforts derived from a good heating apparatus, but the machine itself is an incumbrance that must be put in a part of the cellar or basement, that they have no other earthly use for. It must be crowded into a corner, or away off to one side where it will be entirely out of the way for something more important. Now! What is there of more importance in a cellar or basement than a good fur-

nace? Why it is one of most important factors that go toward making a comfortable, pleasant, happy home. It should be given the place of honor in the best of basements or cellars. In locating furnaces men have come to me and said, "Oh, I can't have it stand here, it will be right in the way of my wine cellar." Another, "I cannot have it here, this is the place for my apple barrels;" in fact they all seem to think that the furnace can stand "anywhere, anywhere out of the way." Now, in regard to this particular case given by the gentleman from Bridgeport, Conn. Taking for granted that he does not wish to place an additional furnace under that part of the house which does not warm up, nor use hot water apparatus connected with his hot air furnace, then there are but two remedies left him—namely, let the furnace stand where it is and turn the house right around so as to face N. E. instead of S. W. or place the furnace almost exactly in relation to the western corner of the house that it now occupies, to the eastern corner. There is absolutely nothing else to be done, and any amount of doctoring and experimenting will not change this ultimatum.

Tin and Gravel Roofs.

From W. C. F., St. Louis.—Having seen several articles in *The Metal Worker* intended to show the superiority of gravel roof and others of the same class over tin roofs, and in view of the fact that anything in support of the durability of metal roofs will be likely to win the interest of your readers, I desire to rise in my place and relate a little of my own experience. I was called upon recently to examine some copper gutters that I made and placed in position in 1841, and finding them in good condition I was curious to go a few doors north, to 518 North Main street, to examine a tin roof that I worked on for O. D. Filley in the same year. I found that with the exception of a few nail holes and a few rusty spots (for I am sure the roof had not been painted in ten years) it was in good condition, and I undertake to say that with two days' repairs and a light coat of paint it is good for another ten years. Now, if your contributor who is so loud in his recommendation of gravel roofs should visit our city he can see roofs, not to mention the roof above referred to, that are doing good service at the age of 37 years.

Dripping Pan Corners.

From A. C., Milwaukee.—When one is required to make a dripping pan of certain dimensions one of the problems presented is how to lay off the corners in such a manner that, when folded over, the edges will lie parallel with the wire. This may be a simple operation to many, and perhaps those who have a convenient method will kindly furnish a description of it for publication in *The Metal Worker*.

A Peculiar Furnace Experience.

From S. J. P., Pittsburg, Pa.—Answering "S. C.," Cleveland, Ohio, in *The Metal Worker* of April 13, I would say that my idea of reducing the size of pipe by using a funnel shaped box is not alone to reduce the capacity, but at the same time to give free access for the cooler air to enter through the large register. The valves in the

register have nothing to do with this, as they are intended to be open at all times. I am satisfied if "S. C." will try my plan it will work, especially if the grate in the room is closed. I have drawn cold air down from the third floor of a building in this way and have no register above the first floor.

How to Put Collars in Furnaces.

From W. B., Milwaukee.—In answer to "W. H. H.," Washington, D. C., in *The Metal Worker*, April 6, who wishes to be informed of an easy way to put collars in hot air furnaces when a flaring top (or bonnet) is used and the collars are taken from the side, the usual method is as follows: In the accompanying engraving A B C D represents a section of the galvanized iron collar, which is cut so as to fit the bonnet and give the desired angle. A flange is turned out, as indicated by A D. Strips of tin are then riveted in the collar. If the rivet holes are punched and the rivets pounded down without using the rivet set, a smooth outer surface is presented for the heating pipe to slip over. After the strips of tin are riveted in the collar (no pattern being used), the outer edge is trimmed so as to project about $\frac{1}{4}$ inch. The tin is then notched, as shown. The collar is then placed against the bonnet and marked.

How to Put Collars in Furnaces.

The opening is then made, when the tin is slipped through and the notched edges bent over. This holds the collar firmly in position, as the flange A D is outside of the bonnet and the notched edges inside. By this method it is necessary to make the entire collar in the shop. Sometimes it is convenient to adjust the collar at the job where a machine for turning the flange and a riveting stake are conspicuous by their absence. Under such circumstances the "plain" collar is made in the shop and of any desired length. Arriving at the job the collar is trimmed so as to fit against the bonnet and give the required angle. The next step is to notch the trimmed end, as indicated by E F. Alternate notches are then bent out at right angles to the collar, thus forming a substitute flange. The collar is then attached to the bonnet, as directed above. By holding a hammer (or brick) inside of the bonnet the outer edges can be pounded down so as to lie in an orderly manner.

The New England streams and rivers rose last week to a height greater than has been reached in the last 25 years. Scores of mills in the great manufacturing centers were forced to stop work until the inundation caused by the swollen rivers subsided. Much damage was done to houses and factories, as well as bridges and railroad tracks, by the freshet.

PLUMBING and GAS FITTING.

A Word for the Plumber.

From SAMUEL A. HEINS, *Rondout, N. Y.*—I would like to say a few words through your valuable paper for the benefit of the public and the first class plumber. As a rule, the plumber is a much abused man and his profession one that the public is slow to appreciate, and yet it is one of the most important of all professions. A good plumber ought to rank with the engineer, the architect or other professional man. He is properly a home physician, and when we reflect how much is expected of him it will be seen that no mere artisan could fill the bill. Most ordinary mechanics nowadays require only enough brains to put together machine made work, and they learn to do only one thing fairly well. A good plumber must think, plan and study constantly. He must work with his own hands and also exercise his ingenuity and common sense to overcome difficulties. No two jobs are ever exactly alike. In making repairs, and especially in ferreting out defects and blunders in the workmanship of others, he must use real sagacity. No mere patcher or solder splasher could do this. The consequences of his labor may be of vital importance, and when this fact is fairly recognized it will be seen that the plumber, instead of being the foe, is the guardian of the household. He supplements the architect and builder, and anticipates the physician by removing the cause of diseases which are liable to occur and are occurring every day where bad jobs of plumbing are found. It should be remembered that plumbing, in its present significance, is almost a new trade. It dates from the introduction of the water carriage system a few years back, the Croton Aqueduct having been completed as late as 1842. The art, therefore, is still in its infancy and but just being accredited with its true importance. In Great Britain, especially Scotland, the plumber's position is recognized. He is known there as a sanitary engineer, and, being trusted and encouraged, he accomplishes far more than in this country. Our people, however, are at last becoming alive to the danger which threatens their welfare, and which can only be removed by the aid of the heretofore much despised plumber. He can be relied upon to largely prevent those terrible scourges, diphtheria, cholera, typhoid fever, small-pox, &c. A board of health and sanitary regulations will not suffice if capable plumbers are frowned upon and discouraged. If the public desire good sanitary work, why not get it in this as in any other line of business. There are quacks and frauds in every occupation, but by using due discretion competent practitioners can always be found. Many intelligent plumbers say that they dislike to suggest to their customers what they deem indispensable changes in their water service or drainage systems for fear their motives would be misconstrued and that it would be said they were influenced by self interest. This is unfair and injures both plumber and householder. Besides, why should

wrong motives be suspected in the case of a plumber any more than that of a lawyer, architect or physician? Certainly there are as honorable men in the plumbing business as in any profession.

Few persons appreciate how much mechanical skill is required in plumbing. Really skillful plumbers are not numerous and their hands are usually their best assistants, yet it is surprising what results are accomplished with them. Working in corners, in dark places behind boilers and in cramped positions, a good plumber will do as

disease induced by reason of defective plumbing. You hear of cases every day in large cities that are not working under a proper sanitary system.

I would recommend that no upright, ventilation or sewerage pipes be connected with a quarter bend of terra cotta pipe. I have seen a number of times the terra cotta bend sink into the ground and the refuse from the water closet overflow and the ground become impregnated with the deadly poisonous matter, and also the joints become leaky, and whenever this occurs look

Example of Lead Burning.

well, apparently, as if he had every convenience and ample elbow room. Few workmen in other trades have to overcome like obstacles. The carpenters, plasterers, masons and smiths meet with no such difficulties, and yet many persons, without reflection, denounce the plumber as belonging to an inferior class instead of ranking him where he properly belongs, among the best artisans. The householders are just finding out that the conscientious, competent plumbers—I mean men who have served an apprenticeship at the business and not mere joint wipers—do not deserve the abuse that so often has been heaped upon them by those who are ignorant of the amount of brains as well as brawn necessary to properly construct a plumbing system. The plumber is as important, if not more so, than the physician, for his work if well done prevents the disease which, when once contracted, the physician cannot always cure. I have seen as many as six persons in one family stricken down with

out for zymotic diseases. In the last seven years I have made 172 inspections in the cities of Pittsburgh, Pa.; Fort Wayne, Ind., Chicago, and different cities in the South, and I have seen as high as three deaths in one family on account of bad plumbing work.

Example of Lead Burning.

A piece of the handicraft of T. B. Walmsley, 214 West Thirty-second street, New York, instructor in lead burning at the New York Trades School, is shown in the accompanying illustration. The card receiver has a base beaten up from a piece of 3 pound sheet lead. The stem is made from a piece of 1½-inch waste pipe, and the receiver from pieces of 3-pound sheet lead, mitted as shown. The base was beaten up over a mold. The stem was beaten square, and then heated and twisted. The different parts were joined together by lead burning, using illuminating gas in connection with a com-

pound blow pipe of which Mr. Walsley is the inventor. This method of lead burning was made a feature of the course this year. In addition to instructing the class thoroughly in lead burning, by means of the oxy-hydrogen machine, Mr. Walsley gave the class instruction in the use of illuminating gas for lead burning and its application for daily use in practical plumbing. He has carried a hose and a blow pipe as a part of his kit for a number of years and has found it indispensable in his practice. This method can be used wherever gas can be had for lengthening traps, for joining waste pipes where they are exposed to view, for burning the vent pipe in the top of the trap and the seams in the safes and wastes, and an immense amount of

The Champion Water Heater.

The R. J. Dillon Company, 2 and 4 South Canal street, Chicago, have just brought out a water heater having some specially interesting features. It is intended to heat water for domestic purposes, and is therefore arranged to be connected with kitchen boilers. To meet all requirements it is so constructed that the water can be heated by gas or gasoline, or a connection can be made with a steam or hot water boiler, and the water thus heated by the house heating plant at no additional expense for fuel. Owners of houses heated by steam or hot water will find this apparatus specially adapted to their purposes. Illustrations are herewith given to show the form of the Champion

with heavy asbestos, thus retaining as much heat as possible, and utilizing it where most required for heating the water. The manufacturers state that there is no opportunity for the contamination of the water by gases. It will be observed that the hot water delivery is attached to the top of the tank in Fig. 1, so that hot water can be drawn from the heater, if desired, without heating the contents of the tank or boiler, but of course when water ceases to be drawn the circulation through the tank commences. By this arrangement hot water can be drawn within a very few minutes after turning on steam or lighting the burner. The maximum amount of gas consumed by this burner is placed at 35 feet for manufactured gas and 40 feet for natural gas per hour.

The Champion Water Heater.—Fig. 1.—Heater Connected with Kitchen Boiler.

Fig. 2.—Heater Using Gasoline.

time and solder can be saved. After a good, strong seam has been burned the surplus lead may be filed off, and, when smoothly finished, to any but an experienced eye it would be impossible to locate the connection between the two parts. Mr. Walsley also uses the blow pipe for wiping joints, finding it particularly useful for wiping when the joint is to be made under disadvantageous circumstances. He looks on this method of lead burning as one that will find great favor when the plumber becomes familiar with it. Proficiency in the work was readily acquired by his pupils, and in Mr. Walsley's opinion this character of lead burning is destined to be widely used.

W. B. BACON, New Castle, Pa., has removed his plumbing establishment from Apple Alley to East street, opposite the City Building.

heater and the principle on which it is constructed. In Fig. 1 will be seen the manner in which the heater is placed in a kitchen, connected both with the steam plant in the basement and with the kitchen boiler, being equipped at the same time with gas burners so that gas can be used when the steam heating plant is not running. The connections are plainly indicated on the cut, so that no further explanation is necessary on this point. In Fig. 2 a sectional illustration of the heater is given, showing a gasoline heating attachment combined with steam heating connection. The radiator in which steam or hot water passes for heating the water is shown in the center of the heater. It is a one-piece casting of gray iron, so that there is no danger of leakage, while its character insures it from any possibility of wear. The shell of the heater is surrounded by a sheet steel jacket lined

The heater is also made without the gas burner so that it can be operated exclusively by steam or hot water from the house heating plant.

KIRTLY BROTHERS, Kansas City, Mo., issue a neat circular relating to their water works operated by compressed air. This system, which has been described in *The Metal Worker*, consists in compressing air in a tank under ground, and by that means forcing the water from an adjacent well or cistern to any height desired. It has, we believe, proved very successful in operation, and the numerous testimonials written from various parts of the country express the highest appreciation of the system. The apparatus is illustrated and fully described in the circular, and in addition reference is made to windmills and some other goods.

The Phillips Circulating Gas Water Heater.

We show in the accompanying illustration a sectional view of the Phillips circulating gas water heater put on the market by the Phillips Gas Stove Works, 92 East Eighth street, Cincinnati, Ohio. It is used in connection with a circulating boiler and, as the cut indicates, it can be used alone or in connection with the water back of the coal range, so that either may be used independent of the other or both at the same time, as desired. The heater can be placed directly under the boiler, but should the boiler be set on a stand the heater can be placed at the side of the boiler. The position of the heater in reference to the boiler will not interfere with its work, provided it

The connection is arranged so that instead of a closet being useless after the earthen horn is broken it can be repaired at once by using this connection, and at a very small expense.

Henry McShane Mfg. Company.

The plumbing supply house of the Henry McShane Mfg. Company, 625-627 Sixth avenue, New York, has many attractions for the plumber besides its handsome showroom. The showroom, with its row of lavatories, its variety of water closets, its display of different kinds of tiling both for floors and walls, and its two handsome bathrooms will give pleasure to any one examining it. But the plumber who is intent on business and brimful of orders will be

bath boilers comprises plain and galvanized iron boilers for use upright or horizontal across the top of ranges, and also a line of copper boilers. On the third floor they have a variety of sanitary earthenware—closets, urinals and lavatories—with the wooden seats and tanks in the different kinds of wood and finish that are required in a modern bathroom. The back portion of this floor is used as a brass finishing shop. If a plumber requires a specially bent flush pipe or an unusual style of waste and overflow, or any of the many special goods required in modern plumbing, they can be turned out at short notice in the shop. The fourth floor is used entirely for enameled baths, one portion being used for a paint shop, where an assortment of tubs finished in white enameled paint, some plain, some with gold bands, and others with special decoration, are prepared so that an order can be filled without delay. The amount of stock that is carried in each of the different departments can be told by a special system in the office. Manager Murray has been largely assisted in the arrangement of the establishment and in inaugurating the system followed by Richard H. Maguire, who is well known to the trade throughout New York and New England by his frequent visits among them.

Convention Gossip.

It has been decided to make the Continental Hotel, Ninth and Chestnut streets, Philadelphia, the headquarters of the delegates to the convention of the National Association of Master Plumbers to be held in that city. The greater portion of the second floor front of the hotel has already been reserved. The business proceedings will take place in the Chestnut Street Opera House, which is less than two blocks from the hotel.

* *

The Philadelphia master plumbers have been doing some effective committee work during the past few weeks, and their determination to leave nothing undone which will enhance the comfort of the visiting delegates has already shown itself in the arrangements concluded. The Continental Hotel is one of the most central hotels and the Chestnut Street Opera House one of the largest theaters in the city of Philadelphia.

* *

Convention week will be a busy one in Philadelphia. Besides being the city selected for the conventions of the plumbers and steam fitters it has also been selected for the convention of the International League of Press Clubs, which assembles on June 11, and which will be attended by prominent newspaper men from all over the land.

EXCELSIOR BRASS WORKS, Dubuque, Iowa, have added to their line of brass goods a full line of plumbers' and gas and steam fitters' supplies. They will carry a complete stock in these lines and sell direct to the trade. They announce that they will handle nothing but such goods as they can guarantee to be first class in every respect. The brass goods they manufacture they have been selling to the largest and best jobbers in the country and their products have always given satisfaction.

The Phillips Circulating Gas Water Heater.

be placed properly below the bottom line of the boiler. The heat is furnished by a powerful atmospheric burner placed directly under the bowl of the heater, surrounded by a casing which prevents the flame from being affected by drafts of air and causes the heat to be evenly and quickly distributed to the whole surface of the heater, utilizing the value of fuel consumed. The heater provides for 3/4 inch flush pipe at the bottom so that it can be easily and frequently flushed and kept clean. The heaters are made in two patterns. Heater B is made of cast iron and C of cast brass and are tested to a pressure of 150 pounds. These heaters are largely in use and are, we understand, giving perfect satisfaction. They can be easily attached to any boiler and are economical in operation.

INSPECTOR OF PLUMBING A. M. Mann, Dunkirk, N. Y., has invented a connection for repairing broken closets.

more attracted to the house by a visit to all its departments. In the cellar a complete line of wrought and cast iron pipe of different thicknesses is carried, with all of the soil pipe fittings that have been found useful in drainage. On the first floor are the showrooms on one side and across the back and the shipping office on the other, back of which is a large space systematically fitted up with shelves and bins stored with a variety of handsome brass goods of the very best quality. Strong claims are made by the house for the character of metal and workmanship of their bibbs, faucets and general line of brass goods. In addition to this line sufficient space is found for carrying a complete line of fittings for wrought iron pipe in malleable and cast iron, plain and galvanized. The second floor of the building is used for an assembly of goods preparatory to their shipment, and for the storage of iron sinks, tanks, boiler stands and bath boilers. Their line of

Maine Plumbers.

John B. Smith, Lewiston, Me., State vice-president of the National Association of Master Plumbers for Maine, accompanied by R. J. Donnelly of Portsmouth, N. H., has been making a trip through his State organizing master plumbers' associations. At Portland and vicinity an association was formed with James Miller president and W. E. O'Connell secretary. An association was formed for Augusta and vicinity with W. Willey of Gardner as president and J. H. Cogan as secretary. At Bangor and vicinity the association formed elected Leighton Davenport as president. A meeting will be called early in May for the formation of a State association.

Kelly's Urinal Connection.

An improvement in couplings is here, with illustrated which is intended to

Kelly's Urinal Connection.

overcome the annoying breakages in earthenware projections on water closets and urinals. With its use no projections are necessary. It has just been patented by Thos. Kelly & Bros., 124 Franklin street, Chicago. They are prepared to fill orders for earthenware of any shape with this connection.

Newell-Booth Company, Limited.

The organization of the Newell-Booth Company, Limited, a new plumbing supply house located at the southeast corner of Broad and Buttonwood streets, Philadelphia, was noted in these columns some time ago. We take pleasure, however, in making some other reference to the progress of the new concern and the principal persons composing it, who, as will be noticed, are men of long experience in the trade and particularly well known in plumbing circles. This new plumbers' supply house has taken its place among the older houses in that city so quietly and modestly that it is now, after only three months' preparation, recognized as the full fledged and aggressive competitor of any like establishment in the East. The trade will note in its title two names which represent probably the widest practical experience in the business possessed by any of the younger men of to-day in this line, each contributing to the enterprise a knowledge acquired through more than 20 years' continuous service at the lathe and in the salesroom. William H. Newell's initiation into the mysteries of the business took place in 1873, when he entered the service of Cooper, Jones & Cadbury as an appren-

tice. He worked at the trade in Philadelphia until 1883, when he went to Haydenville, Mass., as foreman of the finishing shop of the Hayden Company. He returned to Philadelphia in 1886 to take charge of Cooper, Jones & Cadbury's shops and remained there until a year ago. He is thoroughly familiar with every detail of the work, and is the originator of many of the appliances brought into requisition through the gradual development of a sanitary system of plumbing.

A. T. Booth entered the service of Cooper, Jones & Cadbury in 1877, and left the first of the year to engage in this new enterprise. He has not only a practical knowledge of every device made or used in a brass shop, but has also to an eminent degree the faculty of placing his wares on the market. His thorough knowledge of the requirements of the trade enables him to almost anticipate the wants of the perplexed plumber, and his suggestions have in countless instances wreathed in smiles the careworn faces of his customers. Starting as they do in the immediate neighborhood where they have so long carried on the business for others, and with a capital sufficient to permit of the untrammelled exercise of their ingenuity, they begin for themselves with a trade already established, and there is about their establishment, embracing as it does foundry, finishing shop, salesroom and showroom, an energy and completeness which assure its success.

Any mention of the Newell-Booth Company, Limited, would be incomplete without reference to at least two of their valued employees, who in their way are as well known as the principals. Everybody in Philadelphia supply circles knows James G. Scott, who has a quiet way of absorbing knowledge and an exceedingly easy manner of doing difficult things, as if to say: "I do this every morning before breakfast just by way of getting awake." Mr. Scott is familiarly and affectionately known as "Jim," and is said to be particularly strong with the German-town trade. He speaks German in several dialects and likewise has a smattering of pure Irish. Mr. Scott's long residence in that aristocratic suburb, Germantown, has given him a tone which is the envy of his less favored associates. However, Jim is democracy personified, and he has often been known to play pool at 1 cent a cue. The trade will recall Jim's early struggles with the ivories, and the writer can bear testimony to the accuracy of his shots, particularly when he has his eye on a level with the table. Next to his all round knowledge and ability Mr. Scott's unfailing amiability stands out prominently. Another of the old guard, though yet young in years, is "Billy Quinn," whose familiarity with iron pipe and fittings is something wonderful. Billy was also connected in the old days with Cooper, Jones & Cadbury, and if memory serves used to carry the bass with that famous quartet consisting of Scott, Dellow, Ensign and Quinn, with "Bucky" Irven as accompanist on the cornet. Mr. Quinn has charge of the stock room of the new concern and a better man for the position could not be found.

THE MAPLE CITY PLUMBING & HEATING COMPANY have been incorporated, at Monmouth, Ill., with a capital stock of \$2000. The incorporators are C. L. Barnes, Martha M. Barnes and A. L. Knott.

TRAPS AND VENTS.

THE MIDGLEY & SONS SUPPLY COMPANY have been incorporated in Salt Lake City, Utah, and will engage in the purchase and sale of plumbing, water works and mining supplies. The capital stock is fixed at \$30,000. Joshua Midgley is president, John G. Midgley vice-president and Henry Greene secretary and treasurer. These, in addition to David Midgley, William G. Bywater and William Green, constitute the Board of Directors.

A. L. HOBBS, secretary and superintendent of the Raton Water Works Company, Raton, N. M., has purchased the plumbing, tin and sheet iron establishment of T. F. Murphy.

FRANK WALTHER, West Bay City, Mich., has sold his plumbing stock to George H. Burge, who has taken possession of the former's old stand on Midland street.

E. WASHBURN, Orange, Mass., has bought of the Washburn estate the store and plumbing business left by his father, and will carry on the same in the south half of the store on Water street.

WILLIS E. HOPE, Woonsocket, R. I., who has been in the employ of Charles W. Talcott for the past twelve years, has opened a plumbing and steam and gas fitting establishment at 65 Main street.

CUNNINGHAM & STOWE, Marion, Ohio, have moved their plumbing establishment from the Centennial building to the Kling room on the opposite side of the street.

E. C. MCKEE has opened a plumbing and gas fitting establishment at 1626 New Fourth street, Harrisburg, Pa.

JOHN HICKMAN, Paterson, N. J., State vice president of the National Association of Master Plumbers for New Jersey, recently met with a serious accident while driving a horse that he had hired. The horse became unruly, kicking Mr. Hickman, injuring his leg and breaking one of his hands. Being at some distance from where proper treatment could be secured, the injury has proven dangerous.

STARK & DERWALD, 1339 North Halsted street, and Peter B. McGary, 461 Grand avenue, have lately started plumbing establishments in Chicago.

THE KELLEY & JONES COMPANY of Greensburg, Pa., manufacturers of plumbers' and steam fitters' supplies, on account of the demand for larger fittings, &c., have been obliged to add power cranes to their large foundry, and have decided to adopt the Ridgway steam hydraulic crane, the order for which has been placed with Cratig Ridgway & Son, Coatesville.

WE ARE INFORMED that the controversy between the plumbers and W. C. Furrey & Co., Los Angeles, Cal., has been amicably adjusted.

JAMES F. TRAYNOR, Wilmington, Del., has again been successful as an organizer, having secured the attendance of the plumbers of Lancaster, Pa., at a meeting last Saturday night, when the preliminary arrangements were made for a permanent organization of the Master Plumbers' Association in that city.

WE LEARN WITH REGRET of the bereavement of Daniel G. Finnerty of Boston, who lost his wife on the 22d inst. after a short illness. The funeral

took place on April 25 and was attended by a large number of sympathizing friends.

THE INSTANTANEOUS WATER HEATING COMPANY, 888 Broadway, New York, have furnished one of their new combination water heaters and shower baths to F. W. Carroll & Co., 1332 Eighth avenue, for placing in a bathroom in the barber shop of one of their customers.

WE HAVE BEEN FAVORED with copies of two very interesting plumbers' directories. One is a directory of the Illinois Master Plumbers' Association, giving a list of the local associations, with the names and addresses of their members, a brief history of the association, portraits of some of the officers, &c. It is of pocket size, bound in stiff paper, and comprises about 100 pages. The other directory is a 72 page book, issued by the J. Shaver Publishing Company of Chicago, giving names and addresses of master plumbers of Chicago, Milwaukee, Minneapolis and St. Paul. It is also of pocket size and is substantially bound in heavy boards.

THE ILLINOIS MASTER PLUMBERS' ASSOCIATION met at Rock Island, on Wednesday and Thursday, 24th and 25th inst. The following Chicago plumbers were present: P. M. Murphy, C. J. Herbert, D. J. Rock, Joseph Embler, T. P. Culliton, John G. Roland, C. T. Byrne, C. J. Boyd, Thomas Conway, Paul Redieske, Jos. B. Breen, T. C. Boyd, W. T. Geary and P. Sanders.

THE L. WOLFF MFG. COMPANY, 93 West Lake street, Chicago, have just issued advance supplement to Catalogue D, illustrating a new line of bathtubs, comprising Wolff's new model Corona, under roll rim Sultana and Neptuna, besides the regular roll rim enameled iron tubs. The Sultana and Neptuna under roll rim tubs are beautiful productions. The rim is 4½ inches wide and very gracefully rounded, the rim having a roll extending far under it, as indicated by the name. These tubs are white enameled, with compression supply fittings, polished and nickel plated all over and arranged for bottom supply, and the Ideal bath waste, also nickel plated all over. The under roll rim is a new invention, never before attempted in the manufacture of cast iron enameled bathtubs by other makers, adding much to the appearance of the tub. All the other tubs shown are of superior grade. The catalogue is handsomely printed, each page having a colored plate showing a full sized section of the rim used on the tub illustrated above it.

THE old and well established plumbing houses in Chicago are suffering severely from the competition of small shops. The manager of a very prominent concern, which has a wide reputation for the class of work done, stated recently as an illustration of the wretched condition of business that he had just been beaten in competing for an important job by a small plumber who had contracted to do the work for several hundred dollars less than the former had figured as the cost of the material. This is rather strong evidence that some rank "skinning" was contemplated. Aside from "skin" jobs, however, very cheap work is now being done by men who until recently were journeymen, but having been laid off were almost forced to rent quarters and go into business themselves. It is asserted that these men are so eager for something to do that they will work all day, all

night, and Sundays, too, without regard to union schedules, whereas if they were working as journeymen they would stick to the eight hour rule and demand every extra for overtime. Thus the master plumber employing journeymen is seriously handicapped in figuring on work which these working master plumbers are able to handle.

"UNSOLICITED ENCUMBRANCES" is the title of a pretty pamphlet sent out by the Toronto Steel Bath & Metal Company, Limited, in the interests of their steel clad bathtubs, which have come into such extensive use. The title of the pamphlet indicates its contents, which consist of signed testimonial letters from all over Canada.

THE WALCOTT-HURLBURT COMPANY, Chicago, favor us with additional installments of their catalogue. The pages now at hand treat of the Maestrom siphon jet closet, the Volga, the Junista, the Kennebec and the Congo washout closets, the Squantum combined hopper and trap, the Bristol washdown, the Neva siphon jet, the Avoca embossed double trap, the Dececo oval embossed, the Dececo square top embossed, the Como, having seat attached to earthenware, &c. These sheets are arranged for insertion in the portfolio to which reference was recently made.

C. A. NEFF, who has been connected with the Dececo Company as a stockholder since their organization, and for the past few years in charge of their Chicago business, has succeeded P. J. Lynch as manager of their Boston branch at 146 High street, Boston, Mass.

HERRERT STANLEY, who has been in the employ of De Grasse Fox for a number of years will build a new plumber shop on Eden street, Bar Harbor, Maine.

T. B. JOHNS, Lima, Ohio, has taken D. L. Bower as a partner in the plumbing business. Mr. Bower is lately of the firm of Dalzell & Cowles, and has worked at the plumbing business for the past twelve years.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

FRANK A. WENDELL, Salem, Mass., has secured the contract for the plumbing and sanitary arrangements at the house of George R. Kelley of Boston, which is being remodeled into modern style at Marchester, Mass. He will also do the plumbing for Mr. Kelley's stable.

THE COMMITTEE of the Union High School district at Woodsville, N. H., have been authorized to install a heating plant and a sanitary system not to exceed \$1500 in cost.

G. M. HAWTREE & Co., 6822 South Halsted street, Chicago, are to do the plumbing and drainage in the flat building of J. Stelver, Sangamon and Sixty-third streets.

THE HALL STEAM POWER COMPANY, 211 Centre street, New York, have the contract for heating the Merritt apartment house on Eighty-eighth street, New York, and have placed the order for the radiators with John Leitch at 266 Centre street, who manages the New York office of the Standard Radiator Company of Buffalo, N. Y.

MURRAY & DONOVAN, plumbers and gas fitters, located at 29 East Third street, Dunkirk, N. Y., have secured

the contract for fitting the house to be constructed by T. W. Sidey on Dove street. The job recently finished for the Erie Hotel is said to be high grade in every respect.

F. A. CARLETON, New Haven, Conn., has the contract for the plumbing in the large Rafael block of eight tenements on Oak street. The building will have eight water closets, sinks and wash trays.

TAYLOR & TAYLOR, Meriden, Conn., have just taken the contract for plumbing Jos. H. Hodgett's new house in Wallingford.

L. H. TOUCHEY, Waterbury, Conn., has the plumbing of F. B. Rice's four new houses on Kellogg street.

E. S. DAVIS, Middlebury, Conn., is to build a house that will be heated by hot water.

M. SPIER, New Haven, Conn., is to build an \$8000 house to have fire places, a hot water heating plant and modern plumbing.

C. E. COE, New Haven, Conn., has the plumbing in a new house for Mrs. Helen Judge.

T. W. CORBETT, New Haven, Conn., has the plumbing contract for the St. Aloysius Hall.

THE BOARD OF PUBLIC WORKS, Louisville, Ky., has awarded the contract for the new plumbing to be done in the City Hall to C. O'Connor's Sons, at \$4100.

THE entire plumbing system of the City Hall, Rochester, N. Y., is to be remodeled.

THE High School Building Commission, Malden, Mass., has awarded the heating and ventilating contract to Albert B. Franklin for \$11,700. Mr. Franklin is president of the Melrose Y. M. C. A. and has the contract for heating the association building recently completed there.

JACQUES H. HERTS, chairman of the School Trustees of the Twenty-second Ward, New York City, will receive sealed proposals until 9:30 a.m., May 1, 1895, for "Improving the sanitary condition of Primary School No. 41, at 464 West Fifty-eighth street." Hiram Merritt, chairman of the School Trustees of the Seventeenth Ward, will receive sealed proposals until 4 p.m., April 29, 1895, for "supplying the heating and ventilating apparatus for the new school building on the northeast corner of First avenue and Ninth street." All proposals will be received at the hall of the Board of Education, and plans and specifications may be seen and blank proposals obtained at the office of the Superintendent of School Buildings, 146 Grand street, third floor.

CHARLES BREYER, 187 West Division street, Chicago, has the contract for the plumbing and drainage in the flat building of Peter Barband, 810 North Western avenue.

SMITH & DORNEY, 1046 North Western avenue, Chicago, are to do the plumbing and drainage in the flat building of W. Mageeki, Diversey street.

ARNOLD BROS., 507 South Western avenue, Chicago, have the contract for the plumbing and drainage in the flat building of E. Miller, 844 South Homan avenue.

PETER SCHMIDT, 4928 State street, Chicago, is to do the plumbing and drainage in the store and flat building of William Miller, Halsted street, near Archer avenue.

(Continued on page 54.)

STEAM AND HOT WATER.

The Napoleon Radiator.

A radiator which departs from the usual construction is being manufactured by the Moore Bros. Company, Elizabeth, N. J., and put on the market by Lockwood & Adams, 69 Centre street, New York. The accompanying illustration shows a general view of the radiator and also a single section, cut away at the bottom, showing a diaphragm which produces a continuous circulation through the radiator. The sections, instead of being connected through the center, as is customary, are connected on the outside or at the center of the column and alternately so that the inside surface of the radiator is well supplied with air directly from the bottom. As steam enters the radiator it passes up one column and down the next, and from this point into the bottom of the next section, the course of the steam being the same in each section throughout the entire radiator so that positive circulation is secured.

The Napoleon Radiator.

The opening shown at the bottom of the diaphragm permits the condensation to flow directly through the radiator to the return pipe. It is said that the radiators are all tapped two inches in size, and the opening can be reduced when necessary by means of bushings. The supply and return end sections are tapped for air valves, a brass plug being furnished to close whichever opening is not used. The opening in the bottom of the return section is said to be enough lower than the supply opening to allow the condensation to pass off freely. The different sections are connected by means of push nipples. The radiator is being made in several different heights.

THE WILKES MFG. COMPANY, 113 to 123 Clinton street, Chicago, are making a large shipment of heaters to San Antonio, Texas, and have just shipped a large heater to Chihuahua, Mexico, several to Philadelphia, Washington,

D. C., New York City and Brooklyn, N. Y., and report a large trade from St. Louis, Cincinnati, Cleveland and Milwaukee. They have a number of inquiries in regard to the letter of O. W. Norton in *The Metal Worker* of April 25. Trade shows a very large increase over last year.

The Cornell Steam Heater.

The Cornell steam heater, a new boiler put on the market by the J. H. McLain Company, Canton, Ohio, is il-

lustrated in the accompanying cuts. Fig. 1 is a general view of the boiler, Fig. 2 is a longitudinal sectional view, Fig. 3 shows one of the intermediate sections of the boiler and Fig. 4 is a view of the back section showing back wall. The boiler is now made with 32-inch grate, 76 inches high over all and with an average length of about 80 inches. This series will supply from 1100 to 3050 feet of steam radiation, and will be made up of 8 to 14 sections. In the sectional view, Fig. 2, it will be seen that the largest portion of the heaters is made up of duplicate sections, Fig. 3, the different sizes of boiler being made by adding these sections or taking them from it. The heater is designed with a view to combine the excellences of the vertical section boil-

ers for vertical circulation of water and with screw joints and return flue. Each section runs down entirely to the floor surrounding ash pit with water, thereby getting the benefit of heat below the grate and saving the grate from burning out. The sections themselves form the ash pit. There are no direct connections between the sections, but instead they are connected to drums, as shown in the illustrations. It is pointed out that this lessens the chances of damage from leakage, as the nipple connections are in full view and accessible at

The Cornell Steam Heater.—Fig. 1.—General View of Heater.

lustrated in the accompanying cuts. Fig. 1 is a general view of the boiler, Fig. 2 is a longitudinal sectional view, Fig. 3 shows one of the intermediate sections of the boiler and Fig. 4 is a view of the back section showing back wall. The boiler is now made with 32-inch grate, 76 inches high over all and with an average length of about 80 inches. This series will supply from 1100 to 3050 feet of steam radiation, and will be made up of 8 to 14 sections. In the sectional view, Fig. 2, it will be seen that the largest portion of the heaters is made up of duplicate sections, Fig. 3, the different sizes of boiler being made by adding these sections or taking them from it. The heater is designed with a view to combine the excellences of the vertical section boil-

all times should they be in need of tightening. The nipples are made of extra heavy pipe to overcome any tendency to buckle when being tightened up. Each section is an independent circulator. The heater is designed to be covered with asbestos cement, and about the edges of each section are cast keys, between which the cement is forced and when it hardens keys itself in. Cleaning doors are placed in front of the heater, giving easy access to every part of the flue surface, and the soot and dust deposited therein does not require to be removed at front of heater, but is swept down into fire pot and thence finds its way into the ash pit. The grates are designed for burning any kind of coal, even to slack, and the feed doors being large, wood, it is

sald, is very successfully used in it. The bars are interchangeable and will fit any section of the same series. Each

another grate bar is added with each section, thus keeping the proportion of the grate surface and the water heating

and removed from the feed door without trouble. In Fig. 4, illustrating the back wall, is shown the extension of every available heating surface by corrugating it, offering as much surface for heating water to the action of the fire as possible. The flues are so proportioned with the view to give the largest amount of heating surface in conjunction with the shape providing the greatest strength. In the sectional view, Fig. 2, is seen the damper, which makes the draft either direct or indirect. This cut also shows the general scheme of the indirect draft.

Fig. 2.—Longitudinal Section through Heater.

"THE New Sun Steam and Hot Water Boiler" is the title of a catalogue issued by Broomell, Schmidt & Co., Limited, York, Pa. This is the well-known Lindemuth patent in its latest form. The boiler is not cast iron and this point is emphasized on the front cover of the catalogue. The general form of the Lindemuth boilers is familiar to the steam and hot water heating trade and they will be interested in reading this complete account of the latest improvements in this well known apparatus. Sectional views are given showing all the different styles, while special cuts are presented of the top view, of the grate, &c. In addition to the engravings full particulars are printed and there is a full table of sizes and other particulars. The Lindemuth Sun semi water tube steam boiler is illustrated with a broken view as well as the similar boiler for hot water heating. At the end of the pamphlet is a picture of the Heatencook range, which is a combined heating and cooking range, adapted to heat a house of from five to seven rooms by hot water from the kitchen fire, and in addition to heating

Fig. 3.—Intermediate Section.

Fig. 4.—Back Section.

section has its own independent grate bar, and when it is desired to add new sections, obtaining more capacity,

surface in the same ratio. The grates are so arranged that any bar may be disengaged from shaking connection

and cooking the range supplies all the hot water desired for bath, laundry and kitchen work.

Exhaust Steam Heating.

The following paper was read before the Steam Fitters' Protective Association of Chicago by F. G. Perkins of the John Davis Company:

It has been truly said that a man in the forest cannot see the horizon, and so a man engaged in the every day practice of his work, starting in early in the morning and closing at night, very seldom has a fair conception of the gradual changes that take place in his own business. I do not know of any business in which this is more true than the one in which we are all engaged.

I would like to have you turn back a few years and consider the methods and results expected then and what they are now and note the great difference. Take the subject of house heating.

Fig. 1.—Sketch of 36-Inch by 8-Foot Expansion Tank.

Twenty years ago I don't think a steam fitter in this city ever did a successful basement one-pipe job. Such a thing wasn't known. Everything was two-pipe, either steam or water.

Modern Methods.

To day there isn't a steam fitter who would think of doing a two-pipe job on steam except at the point of a pistol, nor would the best mechanics use a two-pipe system on water heating.

Take the division which we call combined power and heating plants, wherein we take high pressure steam and use it in the engine, transferring it from the cylinders into the heating apparatus. Ten years ago it was only used in a few plants. To day we look at any plant that throws away its exhaust steam as being a back number, and the owner who does it should think rightly that he is wasting money. The

Fig. 2.—Sketch of 36-Inch Receiving Tank.

most important inventions of to-day have come about in the proper use of exhaust steam, and to these we will devote the time this evening.

The Problem of To-day.

To day the best problems of engineering in our business that I know of arise in what we call a power and heating plant, where the exhaust steam is to be used in heating. These problems are made the more difficult by the limited area in which all the factors are to be placed. It is an ordinary occurrence to be called upon to place a 500 horsepower plant in the excavation under a sidewalk or alley, though happily this evil is lessening as engineers acquire backbone. As you all know, when we get through with our steam in the cylinder of the engine we have used 2 per cent. of its heat. When we throw it out into the atmosphere we lose 98 per cent., and you can call the exhaust pipe a vertical sewer with its lower end in a man's coal pile. We all know that it is

possible to regain that exhaust steam. What is the best way of regaining it, and to begin, what is the best way of getting the oil out of exhaust steam?

Grease Extractors.

In my experience the best way of getting the oil out of exhaust steam is to run it into an "expansion tank." The oil in exhaust steam is suspended to the drops of water in the steam. Every little drop of steam has a drop of water with oil attached. Interrupt the course of the steam and you can precipitate part of that water, but you can precipitate it more if you can slow it right down; that is, lower its velocity. If you can suddenly slow it down and change its direction as well you can get more oil and oily water precipitated than in any other way. For instance, consider that the exhaust steam comes in through a 6 inch pipe, A, Fig. 1, and the diameter of this tank B is 36 inches. You can readily see that if the steam has a velocity of 300 feet per minute passing through this pipe, when it suddenly emerges into a pipe six times as large the velocity is greatly reduced. That results in dropping that water to which the oil is attached. If you put some deflecting plates at C you can change the direction, which aids it very materially, and that arrangement has no superior in the way of getting oil out of exhaust steam.

The Receiving Tank.

Together with this comes another thing. We will assume that through carelessness more or less oil has passed through and gets into the heating system. The steam is condensed therein, and the oil which has not been extracted and the water come back into the receiving tank together. Now, we must have some means whereby the boiler feed pump will not draw that oil. The receiving tank of course is supposed to have a surface blow off as well as a bottom blow off, which will aid if properly attended to. A more certain way is the following, viz:

Let F, Fig. 2, be the receiving tank. The suction pipe for the pump is G. The valves of the pump of course are supposed to be flooded at least 6 inches by the water line of the receiving tank. The suction pipe G is carried nearly to the top of the receiving tank, with an open end at the water line. A T and a horizontal nipple, H, having an elbow are screwed on and another nipple, I, turning down, say, one half the distance between the water line and the bottom of the tank. You will see that now this pump cannot possibly draw from the surface of the water, where the oil will rise; it can only draw from the point K, and that only as long as the water is as high as the bottom line of the nipple H, J. As soon as the water falls below H the pump will no longer draw until the water level rises again, carrying the oil with it.

Laying Out a Plant.

We will pass now from the details to the general arrangement of the plant. We will suppose that the steam has been carried from the various mechanisms delivering exhaust steam into the expansion tank, where the oil has been removed as far as possible.

The various distributing mains are taken from this expansion tank, D, Fig. 1, and it is customary to cross connect the exhaust steam so that in summer time the exhaust steam will not enter the expansion tank but will pass on to the roof. The exhaust steam is generally passed through the heater before entering the expansion tank.

The sizes of the mains are calculated in the best practice from the amount of hydraulic head at our disposal. We will explain the term hydraulic head later, and for the time being will consider that it means practically the available distance between the water line of our receiving tank and our basement piping. In most buildings over six stories the steam is carried to the attic and the distributing main is placed there, the risers branching from this main.

Connecting Risers.

I believe in taking these risers from the bottom of the main so that each riser takes what little condensation has occurred between itself and the previous riser. By so dividing it, the amount is very small to each riser, whereas, if the branches are taken from the side or top of the overhead main in a large building the aggregate is considerable, necessitating the use of special eccentric fittings where the sizes are reduced or of separate "bleeders," which are a nuisance. In all cases there should be a right angle turn between the main and the riser to allow for expansion, and the best practice is to place the main 6 feet away from the riser. The riser should be valved at top and then descend through the various floors, supplying the radiation as demanded.

The Overhead System.

On an overhead system, where two branches are taken on a floor, it is perfectly practicable to use a cross with no dividing plate inside the fitting, which used to be thought necessary. These risers may be reduced, going down of course, since the condensation always

Fig. 3.—Sketch Showing Circulation through Basement Radiator.

precedes the steam and cuts no figure. No special expansion joints should be used on these risers, whatever the height of the building.

In buildings up to 12 stories the simplest way is usually the best—viz., to anchor the riser in the middle and allow the expansion to go both ways, taken care of by the expansion branch at the top and at the bottom of the riser. The lower floor should never be taken from the riser, and this holds good always on overhead systems, as described, or in the basement one-pipe system, which will be described later. After passing the second floor the riser may be sharply reduced at the ceiling of the first floor to 1½ inches if the riser started 3½ inches, or 2 inches if the riser started 4 inches. A 3 inch riser at the start may be reduced to 1½ inches, but the difference in cost between 1½ inches and 1½ inches for this short run is so slight that I do not reduce below 1½ inches.

These various drips are connected in the usual manner and brought back into the receiving tank. The overhead system is, of course, the ideal way of doing steam work, and the gratitude of the trade is due to John H. Mills, the inventor of it. It was the longest step in advance of previous practice that steam fitting ever took, and his later extension of it to hot water was the next great step, and to this man,

easily the foremost heating engineer of the day, our trade must ascribe the largest share of the advance in the last 20 years.

The One-Pipe System.

The one pipe system in the basement must be conducted on somewhat different lines, for the possibility of trouble is more frequent, owing to the fact that in the risers the steam and the water take opposite courses, which, however, is no drawback if the piping is properly run.

In this method the piping must be kept full size to a much greater degree than in the overhead method, and all reductions must be made by the use of eccentric fittings. The risers must come from the top or the side of the main, and none should be taken out within 4 feet of a right angle turn of the main pipe if possible. The branches to the risers should be run one size larger than the riser, and in cases where the riser is distant 10 feet the branch should be increased two sizes. It is bad practice to run a branch of over 14 feet, and, in fact, the speaker would say that 10 feet is the limit which he would advise running a branch. In cases over this it is better to deflect the main so that the main can be run closer.

The first floor radiation should be taken from the branches, and never from the riser, and, of course, every branch should have a valve close to the main with a drop tee behind the valve, so that the riser can be drained of its condensation if repairs are needed.

The main should be kept high until it reaches the boiler, and all underground piping containing a constant amount of water is to be discouraged, and one of the great advantages of the one-pipe method is the fact that the pipes are always dry, except for the slight amount of condensation always passing.

In other words, when the steam pressure is down there is no water in the piping to freeze.

Local Methods.

It is a curious fact that the methods of steam fitting are better west of the Alleghany Mountains than on the east coast, and the whole difference is in the way of piping steam and water.

The one-pipe system in New York, Boston, Philadelphia or Baltimore is looked upon with the greatest suspicion and disfavor on account of the failures made 15 years ago by people who did not know how it was done, whereas all of us who have been through both methods know the one-pipe plan is as far superior to the two-pipe method in quietness, ease of operation, freedom from leaks and repairs as the modern locomotive is ahead of the first one built by Stevenson.

No wonder in Chicago to day would think of having two valves to a radiator, to double the annoyance from leaks, noise and the chance of water backing up in the radiators, when one is closed by mistake, nor would he consent for a moment to have a sealed water line always full of water to freeze when the steam went down through negligence in cold weather. Yet these things are tolerated and, in fact, specified by the best architects of Boston and New York, and there is no way to account for it.

Circulation Under Low Pressure.

In summing up the question of piping, it is not a good workmanlike system, great or small, 1000 feet or 50,000 feet, unless a circulation is possible in every part of the system with a gauge pressure of 2 ounces ($\frac{1}{4}$ pound),

if there is any noise of any description in the pipes (unless from misfiring of valves), or if, on starting the apparatus cold, any flooding of pipes occurs.

In the hasty fashion our time allows we have gone over the skeleton, so to speak, of our apparatus. Let us take up together the question of utilizing the steam to its fullest extent, remembering that the wreath of steam flowing from an exhaust head in winter is a reproach either to a short sighted owner or to poor engineering on somebody's part.

I want to ask you to consider the question. Does a man always use his exhaust steam when his usual pressure is 3 or 4 pounds? Can he do so? Is it not a fact that, whenever you ask a man in a modern building if he uses his exhaust steam, he says, "Yes." And if you ask him his pressure, he says, "Well, we use 2 or 3 pounds pressure. Sometimes, in cold weather, we get up to 6 or 7 pounds, but don't like to do so on account of the back pressure."

Back Pressure.

If a man's usual back pressure is 4 pounds and he sets his back pressure valve to 6 pounds, and if his electric light engine, his boiler feed and elevator pumps all happen to discharge steam into that system at the same time the pressure generally rises 2 or 3 pounds. If he has his back pressure valve set 2 pounds higher the sudden increase, of course, lifts the back pressure valve and the steam gets out. If you will watch the exhaust head of any large plant in winter time you will often find that during the time that the exhaust steam ought to be fully at work, and even during the time that the normal demand for heat in the building is more than the normal exhaust steam will supply, the reducing pressure valve will occasionally open and exhaust steam blow out. The reason for it is that they cannot endure more than a certain amount of back pressure without impairing the efficiency of the various mechanism. The increase occurs occasionally when all the mechanisms discharge exhaust steam simultaneously.

Saving Exhaust Steam.

If this is true, I want to ask you if it would not be possible to save all that exhaust steam in case the normal back pressure was only $\frac{1}{4}$ pound, since, then, all this additional pressure which would be caused by these mechanisms discharging at once would then only amount to 3 pounds, and it could be held there, without blowing off, until some of those machines slowed down, and the heating system could absorb it. This is a very important point, and you must consider it carefully, for on it hangs what we now will consider. We have never had any method, prior to the last few years, by which we could use exhaust steam the winter long without using from 2 to 5 pounds pressure. That 2 to 5 pounds pressure was a great step in advance, but not as great as, I am confident, will be taken before long, and the next step will be so an engineer can say: "I only carry atmospheric pressure." If he only carries this, and is in the circumstances we have treated before, he will not lose any exhaust at all. How can this be done? I have looked into that question for a year and a half, and have seen ways by which it can be done. It can be done by putting some accelerating apparatus on the other end of the system, by which the friction in the pipes and, most of all, the air in radiators will be taken away. There are two ways that I know of at present by which this is attempted.

Vacuum Systems.

Both are systems employing vacuum. One system applies pump and cold water spray to the return end of a double pipe circulation, and I have seen it do excellent work. One drawback with that system, to my mind, is that the pull is constant. As long as the plant is in operation the pull exists on the return pipes, drawing the steam as well as the water. The steam coming through is condensed by a cold water spray, and the excess is passed off through the waste pipe. That is a waste. Whether that waste is enough to overcome the counterbalancing advantages of using vacuum, if we had no other way to obtain it, is another question. Another thing is that the important point of accelerating the discharge of air, which is the great obstacle to circulation, is not touched at all, except in the indirect way of pulling at the returns. To use this method on one-pipe work would necessitate changing the heating plant to two-pipe. But I have seen applied and used myself another method of vacuum, which seems to me to have some very strong points of advantage in its favor. The system essentially consists in attaching the vacuum not to the return end of the circulation, but to the rear end of the radiator, stopping it by means of an automatic air valve as soon as the radiator becomes warm. This, you can see at once, is a very good point in its favor. A man doesn't want his vacuum at work any longer than it is of use. The moment the surface gets warm it should stop. Take a radiator loop—the end loop.

The Use of Air Valves.

If to the end loop of this radiator you can attach an automatic air valve, and at the end of that air valve you can attach a small pipe, bring it down into the basement and attach it to a small ejector, we clearly can aid our circulation, and by more than the amount we can reduce the pressure on the other end, for I have seen cases on old piping where a circulation previously was possible only at 35 pounds, and now the circulation is possible on an ounce, and practicable on $\frac{1}{4}$ pound, the pressure last winter varying from $\frac{1}{4}$ to $\frac{1}{2}$ pound. This shows us that the elimination of air in the radiator has a larger bearing on the questions of the circulation and of getting the heat from the surface than we have ever considered. In this case putting 15 inches vacuum at the air valve circulates steam where 25 pounds would not before, and the surface gives out more heat at atmosphere than it formerly did at 25 pounds. Of this we will speak later. Now you will see the bearing of the question I asked you before: Is it not possible, by means of reducing the customary pressure, on modern work even, to hold all of our exhaust steam by incurring an increased pressure, which then can be allowed until the apparatus can pick up and draw on it, and so we do not have to waste the temporary surplus? I am satisfied that the answer is "yes."

Advantages of a Vacuum System.

There is another advantage in this method, which is called the Paul system, of which I would speak to you. As you know, a very great source of annoyance has been when we have been called upon to heat rooms in the basement or below the water line of our receiving tank. Usually we have to put in ceiling coils, or else trap the return into the catch basin, and waste it. It is possible, by means of this Paul system, to put the heating surface at or be-

low the water line of the receiving tank on atmospheric pressure, carry the waste water along the ceiling and discharge it in any way you please. For instance, it is possible, assuming that K, Fig. 3, is the floor of our basement and L the water line of our receiving tank, to put a radiator at M, connect the steam into it, take the return from it and throw it over into the tank O, and have this radiator perfectly dry. There are some curious conditions, I have seen 1 pound pressure in this pipe P delivering steam. I have seen 1 pound pressure in this pipe Q all the way from the radiator, no vacuum at all, just pressure, yet I have seen the water of condensation lift from the radiator, simply induced by this tiny air pipe A at the top of the loop, which is attached to an exhaustor. This subject is a very interesting one in some ways. If you can circulate a system below atmosphere in a large building, you can certainly circulate it below atmosphere in a dwelling house.

Low Temperature Steam Heating.

If you can circulate it below, how much below can you circulate it? In other words, it is possible that in a few years from now we will be heating houses not by hot water but by steam below atmospheric pressure, of such a low temperature that it gives all the advantages of hot water without any of the disadvantages of the larger radiation, &c. For instance, we know water under 12 pounds pressure, measured from vacuum, evaporates at 213°. At 4 pounds it evaporates at 150°, because the pressure is partly taken off. Suppose it is possible in a heating apparatus to reduce the pressure inside that system. It is then clearly possible to vaporize that steam at 150, 160 or 170, depending entirely on the amount of attenuation to which you carry the pressure. I present this subject for your consideration as being possibly one of the lines on which our trade will advance, precisely as we have gone, step by step, in the last 10 or 15 years until now we have a kind of steam fitting which every man may well be proud of.

Probably half the people before me are working engineers or steam fitters like myself; men who meet every day with some of these questions concerning the application of steam and power, and I would like to give an illustration of one advance in steam fitting coming under my personal observation.

The Auditorium Building.

Every one here knows the Auditorium Building. The old plant was piped on what was called the Osborne system, now little used. If a man put in a receiving tank under that system it was called a hydrothermoston, and such curious things as that long worded way of doing simple work. The Auditorium Hotel cost in 1891 \$46,000 for attendance and fuel. The Auditorium office building cost \$42,000. In round numbers this was \$90,000 for the two buildings. At that time another building was erected called the "Annex." The cost of running that plant on the same basis would have been \$30,000, which would make \$120,000 for heating these buildings. A new plant was erected to do the whole work, the two old plants being abandoned. The cost of running the new plant per year for the last year, including attendance, engineer's expenses, fuel, oil, depreciation, and in fact everything, was \$55,000, which shows a saving of \$65,000 in the plant as designed to-day over that of five

years ago. Is there any stronger evidence that our business is advancing?

Queries.

Question 1: In that connection you illustrate there, Fig. 3, does that air valve B have to be connected on each separate radiator, or to the main return at the extreme end?

Answer: It is necessary to connect each air valve. There has to be a connection from each radiator and a connection from the top of the loop as well. This loop does not exist for each separate radiator. It is formed after the returns from all the radiators are united. Then this pipe is taken and discharged over into the tank.

Question 2: And the air valve pipe?

Answer: The pipe from the air valve is taken from each separate radiator.

Question 3: Can you connect into a main exhaust pipe going out of doors in a manufacturing plant with no back pressure valve?

Answer: Yes. You might call this a "leech" system. Each one of these radiators has this leech on it which sucks the air out of the radiators and closes when the steam strikes the automatic valve, thereby limiting the pull. All the time below this air valve there is a vacuum of 10 to 15 inches. Any time the radiator cools this automatic air valve opens until the air is drawn out and then shuts. The pull across the seat of the air valve keeps it clean. The use of a back pressure valve merely allows a higher pressure than atmosphere to be carried.

Question 4: How does the reduction of temperature in radiator caused by reducing the pressure affect the amount of heat given out by radiator?

Answer: That is an important question. If any of you have a plant under your charge where you are using 35 or 40 pounds pressure, the thought would strike you at once. I find this to be true, of which I was skeptical. By getting all the air out of the heating surface we increase the efficiency of that surface so much as to make up for the difference in pressure.

The building to which I have referred before formerly used 35 pounds pressure, and the engineer, who is before me, has told me that he has less trouble in corner rooms now on 1 pound pressure than he had formerly with the greater pressure. There is no way to account for it, unless that by using this method we get all the air from the radiators so that every inch of that surface is alive. For instance, a communication has been made to me by an engineer, who states that from a large indirect coil, on what is called the Sturtevant system, which formerly used 10 pounds pressure, the temperature of the air was raised 5° by putting on the Paul system, using ½ pound pressure.

Question 5: What causes a circulation in that system after the air valve is closed, when you have only that ½ pound pressure, and the system has been working on 40 pounds pressure before?

Answer: The same thing which was present before—viz., the condensation of the steam present in the radiator, now greatly aided by the withdrawal of the air produced by the condensation of the steam and liberated in that process.

Question 6: What effect would that have on a one-pipe job?

Answer: That is a good question. I hoped that would come. It has no different action on the one-pipe system than it has upon the two-pipe system, because the points of vacuum have

nothing to do with the return system but are on the radiators themselves.

Question 7: Wouldn't it have a tendency to pull the water to the back end of the radiator in getting steam up first?

Answer: No, it works the other way. If in ordinary practice you open the air valve wide the water sometimes rushes out if the piping is a trifle small. That is so because there is always some water present, but by using this system the danger is anticipated. The radiator is shut off and cools, opening the air valve so that a 15 inch vacuum begins to pull on the radiator, re-evaporating the water left in the radiator and drawing it away, leaving the radiator dry, so that on very unsatisfactory radiators, radiators that formerly filled with water all the time, the application of the attachment has cured that. In a hotel building or apartment house the odor from air valves is very much complained of. That is nearly always present in case any strong boiler purge is used, forming a combination with the elements in the water, and by using this method I have observed that the cause of complaint is entirely done away with. The engineer at a large hotel told me some time ago that on one occasion the patrons of the hotel complained of a smell coming from some boiler purge he was using, so he went to the drug store and got some oil of peppermint and put it into his expansion tank, and everybody went around sniffing and accusing the other fellow of having peppermints about his person.

Question 8: Is that tank, Fig. 2, a closed tank?

Answer: Yes. The particular point I want to insist on is that by doing this the water must be as high as J in order to let the receiving tank draw from K. There always has to be that difference between the surface of the water and the point of the pipe, and by doing that it is impossible to draw any oil at all. I have seen tanks rigged up like that with no extractor, and the whole water glass here would be filled with oil, and yet there would be no trouble at all.

Question 9: How do you get the grease out of it?

Answer: You have your blow off here at M coming inside and running up with a long thread nipple, and by shutting the angle valve and opening the gate valve you blow from the surface.

The Universal Heater.

In the accompanying illustration we show a new hot water house heating apparatus called the Universal heater, made by the Illinois Safety Heater Company of St. Charles, Ill. The apparatus is designed for using gas made from any of the fuel oils, preferably gasoline. A tank, or more correctly speaking a gasometer, is buried in the ground a short distance from the house, and is filled with fluid through a filtering device, air being supplied to the tank by means of an automatic air pump. A pipe leads from the tank to the gas generator and to burners located beneath the heating apparatus. Fig. 1 shows the Universal heater suspended from the ceiling of the cellar with the flow and return pipes connected with it. Fig. 2 shows the longitudinal section, and Fig. 3 the cross section. The gas after passing through the generators is carried into the heater as shown in Fig. 2 and is burnt in a series of jets. The products of combustion are forced to pass the entire length of the heater twice by an

arrangement of heating surfaces inside of the heater covering before they escape to the chimney. The heater itself consists of two thin, wide water sections placed one above the other and connected at the center. A return header is connected with the lower air section to receive the return pipes from the heating system. At the center of the top water section is a flow header

HEATING NOTES.

THE CARTON FURNACE COMPANY, Utica, N. Y., have received notification from the Patent Office at Washington that the application for the patent on their steam and hot water boilers has been granted. They are now starting to get up another series of boilers to embody all the general features of their

The Universal Heater.—Fig. 1.—General View.

from which the heating mains are taken. Some idea of the power of the apparatus may be gained from the size of a house which it is claimed has been heated by it. The house contains several rooms, the amount of space heated being 12,000 cubic feet. It is said that with the mercury at 18° below zero there was no difficulty in heating the house comfortably. It is also stated that the heater was run for 15 days on an average of 41 cents a

present series A. These patterns they intend to rush to completion and have them ready for the early fall shipments.

WASHEURN, GARFIELD & Co., Worcester, Mass., are making a specialty of the Andrus water heater, made by Abendroth Bros., N. Y., in all of their hot water heating contracts.

THE RICHMOND STOVE COMPANY, Norwich, Conn., issue a circular giving illustrations of the Richmond sectional

Fig. 2—Longitudinal Section.

day for fuel. The advantages claimed are that the heater may be suspended from any part of the building desired, that it occupies no space on the cellar floor, and that there is no dirt from ashes and coal. It is pointed out furthermore that it may be operated as easily as an ordinary lamp. A supplementary generator is arranged with an automatic cut off and alarm, so that should the gas condense and the fluid run back, it will overflow into a drip pan and then into a bucket suspended on a lever which controls the gas sup-

heaters of the two new series, Nos. 325 and 336. These heaters are for steam or hot water, and those who wish to study their construction can gain a complete idea of their features from the numerous illustrations in the circular. The essential particulars of sizes, etc., are also given in tables at the end.

THE FARQUHAR HEATING COMPANY, Blue Island, Ill., manufacturers of warm air, steam, hot water and combination heaters, have changed the firm's name to the Wireton Heating Company. Foster & Glidden, 53 Dearborn street, Chicago, are the company's local agents.

The steam and hot water heating contractors in and about Chicago are doing much less business than usual. A few of them have been able to pick up enough contracts to keep their force of workmen going, but the majority find their expenses exceeding their income. The consequence is that prices are seriously cut. One concern the past week concluded to test values pretty thoroughly and made a bid on a fine job of steam heating at absolute cost. But he proved to be a little too conservative in getting his figures down, for a competitor beat him just \$300, which is about 10 per cent. of the total amount of the contract

Patentable and Unpatentable Inventions.

The Supreme Court of the United States, in an opinion read on April 22 by Justice Brown, declared a decision in regard to the distinction between patentable and unpatentable inventions which is of considerable interest to inventors, owners of patents and manufacturers. The case in question came from the Circuit Court for the Northern District of California, and involved three patents for the manufacture of belt pulleys and for the product of that process, which Philip Medart *et al* alleged had been infringed by the Risdon Iron & Locomotive Works. The California court's judgment was in favor of the plaintiffs, but this ruling was reversed. Discussing the claims of the patent for the manufacture of the pulleys, Justice Brown said: That certain processes of manufacture are patentable is as clear as that certain others are not, but nowhere is the distinction between them accurately defined. There is somewhat of the same obscurity in the line of demarkation as in that between mechanical skill and invention, or in that between a new article of manufacture which is universally held to be patentable and the function of a machine which it is equally clear is not. It may be said in general that processes of manufacture which involve chemical or other similar elemental action are patentable, though mechanism may be necessary in the application or carrying out of such processes, while those which consist solely in the operation of a machine are not. Most processes which have been held to be patentable require the aid of mechanism in their practical application, but where such mechanism is subsidiary to the chemical action the fact that the patentee may be entitled to a patent upon his mechanism does not impair his right to a patent for the process, since he would lose the benefit of his real discovery, which might be applied in a dozen different ways if he were not entitled to such patent. But if the operation of his device be purely mechanical no such considerations apply, since the function of the machine is entirely independent of any chemical or other similar action. . . . It is equally clear, however, that a valid patent cannot be obtained for a process which involves nothing more than the operation of a piece of mechanism, or, in other words, for the function of a machine.

In a certain London restaurant use is made of plates electrically heated, in order to keep the food warm. So long as the current is turned on the food is kept at an even temperature. There is said to be no danger of receiving a shock on touching the plate.

A dispatch from Tokio, Japan, states that in view of misstatements and misrepresentations in regard to the terms of the China-Japanese treaty of peace, the Japanese Government has issued an official declaration that the commercial concessions obtained by Japan were not exclusive, but extend to all powers now using the treaty ports of China. Japan, it declares, has secured these privileges for the general good of all countries.

The report has been confirmed of rich gold "strikes" in Bonito Creek and in the Cochiti district of New Mexico.

Fig. 3.—Cross Section.

ply, and should this device become full the gas supply will be cut off, and when arranged with an alarm the people of the household will be apprised of it.

ROOFING AND CORNICE.

Pattern for a Diagonal Raking Bracket Under a Hipped Roof.

BY W. N.

We recently did some work on a tower, the section of whose cornice is shown in Fig. 1. As will be noticed, wooden rafters projected over the walls and were sheathed at the top and bot-

tom as shown, then galvanized iron brackets were placed under the hipped roof and represented the wooden rafters below. The method of construction may be briefly described as follows:

After all the wood work was covered, galvanized iron brackets L, Fig. 1, were nailed to the under side of the hipped roof, the brackets being shown in plan view in Fig. 2 by B and C.

tom as shown, then galvanized iron rafters were set on the wooden plate S, and sheathed below, the sheathing would run flush with the flange J on the molding B C.

E E E represents the sheathing on the top, front and bottom of rafters, and is covered by a galvanized iron

molding and planceer, shown at F, which overlaps at J, and is nailed to the flange of the lower molding. A lock is formed on to the molding F, at O, to which the roofing is attached.

Fig. 2.—Plan, Elevation and Diagonal Elevation and Method of Obtaining Patterns.

PATTERN FOR A DIAGONAL RAKING BRACKET UNDER A HIPPED ROOF.

After all the wood work was covered, galvanized iron brackets were placed under the hipped roof and represented the wooden rafters below. The method of construction may be briefly described as follows:

After all the wood work was covered, galvanized iron brackets were placed under the hipped roof and represented the wooden rafters below. The method of construction may be briefly described as follows:

After all the wood work was covered, galvanized iron brackets were placed under the hipped roof and represented the wooden rafters below. The method of construction may be briefly described as follows:

After all the wood work was covered, galvanized iron brackets were placed under the hipped roof and represented the wooden rafters below. The method of construction may be briefly described as follows:

After all the wood work was covered, galvanized iron brackets were placed under the hipped roof and represented the wooden rafters below. The method of construction may be briefly described as follows:

the normal bracket and placed under the angle of the hipped roof, the patterns for which are required. For obtaining the patterns for the face and sides of the bracket proceed as follows: A, in elevation in Fig. 2, represents a duplicate of the molding and bracket shown in Fig. 1. Directly under the elevation, and in line with it, draw a plan view, as shown, with the diagonal or miter line E F. At right angles to E F, on either side, place one-half of the width of the brackets B or C, as shown at D. Parallel to E F draw the lines I G and Z V; connect the points I J and Z V, then will I J V Z F G represent the plan view of a diagonal bracket. Now space the molding in the elevation into an equal number of parts, as shown by the small figures 1, 2, 3, 4, &c., and drop perpendicular lines from these points until they intersect the diagonal or miter line E F.

From these same divisions in the molding draw horizontal lines to the right, indefinitely, as shown by the dotted lines 1 1', 2 2', 3 3', &c. These horizontal lines will be used in developing the pattern for the side of the diagonal bracket. Now space into an equal number of parts the profile of the

on the pattern. The cut K M in the pattern is the one which will be joined together to obtain the angle I J V in plan, while the cut L N is the one to which the pattern for sides shown in diagonal elevation will be soldered. For obtaining the pattern required for the sides of the diagonal bracket proceed as follows: On the diagonal line E F in plan, Fig. 2, are shown the intersections obtained from points in the molding and profile of bracket in elevation, and numbered to correspond with those in the elevation. Take a tracing of the diagonal line C F in plan and place it with the numbered intersections, as shown by E' F', parallel to the dotted lines previously drawn. As the section on the center line is the same as the side of the diagonal bracket, the center line J' F' is made use of in place of the side Y' Y'' from which to obtain the pattern of the raking side.

Now at right angles to the line E' F' and from the points thereon draw lines upward intersecting horizontal lines of similar numbers. Thus, lines drawn upward from the intersections 1, 2, 3, 4, &c., on the line E' F' intersect with horizontal lines 1, 2, 3, 4, &c., while lines drawn upward from the intersec-

H in Fig. 3. Connect the joints E, H and F; then will the profile E H F in Fig. 3 represent the angle of the hip at right angle to its rake and will be the profile required (as shown by E' H' F' in Fig. 4) when bending the flange on the face of the bracket and when soldering the face together. Now, parallel to B L in Fig. 3 and through the point E draw a line, as shown by I K. Then will the angle E I J in Fig. 3 represent the profile required for bending the flanges on the side of the bracket, the profile being shown in position for the outside flange, by E' I' J' in Fig. 4. Fig. 4 is a perspective view of a finished diagonal bracket laid on its side, so as to clearly show the face and the use of the profiles before described. V, V, V, V, represent flanges; those on the face are formed at right angles, while the others are bent according to the profiles obtained in Fig. 3.

The National Sheet Metal Roofing Company,

339-341 Grand street, Jersey City, N. J., are established in a new building and are prepared to furnish roofing supplies of every character and their spe-

Fig. 3.—Method of Obtaining Profile for Bending the Flanges.

Fig. 4.—Perspective View of a Finished Diagonal Bracket Laid on its Side.

PATTERN FOR A DIAGONAL RAKING BRACKET UNDER A HIPPED ROOF.

bracket A in elevation, as shown by the small figures 1, 2, 3, 4, &c., and through these points draw perpendicular lines upward indefinitely, and downward until they intersect the miter line E F in plan.

Through the same points in the profile of the bracket draw horizontal lines to the right indefinitely, as shown by the dotted lines 1 1', 2 2', 3 3', &c. Now parallel to the perpendicular lines drawn through the profile of the bracket draw the stretchout line H G, upon which place the stretchout of the profile of the bracket A in elevation, as shown by the small figures 1, 2, 3, &c., on the stretchout line H G. At right angles to H G, and through the small figures, draw lines intersecting those of similar numbers drawn upward from the profile of the bracket A. By tracing a line through these intersections, as shown by K M, the miter cut is obtained.

Set off the distances K L and M N, equal to I J or J V. Now trace the miter cut K M, as shown from L to N; then will K L M N represent the pattern for one half the face of the diagonal bracket shown in plan by I J or J V. The two dots shown on the pattern indicate the bend. As two of these half faces are required to complete the single I J V in plan in Fig. 2, one will be formed right and the other left, corresponding to the profile shown at A in elevation. Care should be taken when forming to hold the profile at right angles to the lines K L or M N

tions 1, 2, 3, 4, &c., on the line E' F' intersect with horizontal lines 1, 2, 3, 4, &c. A line traced through these points of intersection, as shown by O R B P, will be the pattern for the side of the diagonal bracket. From the point X in elevation draw a solid horizontal line, as shown by X X. From the point E' in plan below diagonal elevation draw a perpendicular line upward until it intersects the solid line X X at Y; extend the line P O to Y, as shown. After having the pattern for the face and side of the bracket, it will be necessary to obtain the profiles for bending the flanges on the face and side of the bracket. At first sight this is overlooked, but is necessary when bending the flanges and finishing the bracket. To obtain these profiles proceed as follows: Upon the solid line X X in diagonal elevation in Fig. 2 establish any point, as T. Through the point T and at right angles to Y P draw a line intersecting the line Y P at U.

As the plan shown in Fig. 2 is a right angle, then construct a right angle, A B C, Fig. 3; bisect the angle A B C and obtain the miter line B L. Now take the distance from Y to T in diagonal elevation, Fig. 2, and place it on the miter line B L in plan, Fig. 3, from B to D. At right angles to B L in Fig. 3 draw a line through the joint D, intersecting the sides of the right angle A B C at E and F. Now, take the distance T U in diagonal elevation, Fig. 2, and place it as shown from D to

cialties at short notice. In front of the building is a statue of a schoolboy, mounted on a pyramid covered with Walter's patent standard metallic shingles. One of the large plate glass show windows which are on each side of the entrance displays a variety of relief ornaments for cornice work and a line of their special finials. The other window is arranged with various styles and widths of building paper, forming a support for a large sheet metal eagle with outspread wings. At one side of the building is a show board on which the Walter, Clover Leaf and Queen Anne tiles are displayed in the various sizes—7 x 10, 10 x 14 and 14 x 20. At the top of the building the cornice itself is a handsome display of architectural sheet metal work. On entering the building the office is found at the right, and the front portion of this floor is used for assembling the goods preparatory to shipment. The back part of the building is used as a press department, over 20 stamping presses being run with power from a gas engine for stamping the various designs and sizes of tin, galvanized iron and copper shingles. The second floor of the building is used for a painting shop and drying room and for the storage of stock after being made ready for shipment. At the back part of the building and extending across one end a third story is built and used for a galvanizing and tinning department, and is provided with a steam boiler for heating the baths and

for furnishing steam for the drying coils. After the shingles have been stamped in the black iron they are washed and transferred to the pickling tank. After receiving a coating of tin or zinc they are given two water baths to remove the flux, and they are then arranged on racks made of piping, through which steam circulates for drying them. The plant can readily turn out 400 squares of roofing material in a day.

Metal vs. Earthen Tiles.

All who have had experience in the roofing business know that owing to the weight of a tiled roof a much more substantial foundation is required for it than is necessary for a metal roof. At the present time there is a disposition to use freely the tiled effect in architecture, and it has been pointed out that it can be supplied more advantageously through the use of metal than with the earthenware red tiles so largely used in the older countries. It has been stated by an authority that a red tiled roof can be furnished at \$30 a square and will place on the building a weight of 600 pounds per square. It is claimed that at the present price of copper the same effect can be gained by the use of copper tiles at a considerably less cost and at a weight of about 150 pounds to the square when 16 ounce copper is used for the tiles. Either tin or galvanized iron tiles can be secured at a less cost, and where they have been used they clearly demonstrate that they make an excellent roof, free from leaks and attractive in appearance. It is stated that even in the cyclone district a roof of metal tiles is seldom blown off, as the wind pressure that can get under any one tile has no effect on those near to it.

Sheet Metal Front.

The accompanying illustration shows a sheet metal front recently executed by J. F. Barber & Co., Hazleton, Pa., for the lodges of the Junior Order of the United American Mechanics of Hazleton. The facade is made of sheets of iron put together in imitation of flat stone, the plies being grooved and locked together. The fluted pilasters are made of No. 24 galvanized iron. The cornice at the top projects 30 inches and is made of sheet metal, as well as the shield and other ornaments shown in the illustration. The eagle is a piece of sheet metal work furnished by W. H. Mullins of Salem, Ohio, while the two other figures were from the J. L. Mott Iron Works.

FLASHINGS.

THE NATIONAL ASSOCIATION OF TIN, SHEET IRON AND CORNICE WORKERS, which held a convention at Indianapolis, Ind., will hold its next convention in Detroit, Mich. The association elected the following officers: General president, T. J. Ritter, Chicago; first vice-president, Joseph Harman, Duluth, Minn.; second vice-president, W. F. Gilmore, Toledo, Ohio; general secretary, James F. Hughes, Pittsburgh; general treasurer, James H. Horan, Louisville; chairman of the Executive Board, Joseph Harman, Duluth; Executive Board, J. F. Griffin, St. Louis; James Somers, Cincinnati; Frank E. Truchet, Fort Wayne, Ind.; H. H. Brough, Peoria, Ill.; delegate to the American Federation of Labor, J. C. Stuhlman, Grand Rapids, Mich.; general organizer, George M. Hockett, Indianapolis.

THE CATALOGUE just at hand from the Kanneberg Roofing Company, Canton, Ohio, is bound in more than ordinarily attractive covers. The decoration is an embossed design embracing the name of the concern, and the color treatment is very pleasing. The trade, however, will be more particularly interested in the contents of the volume, which relate to the sheet metal goods manufactured by the Kanneberg Roofing Company. In a prefatory note they mention that in this edition of their catalogue they have omitted the old time usage of uninteresting descriptions

ventilators and the like. Part three gives instructions for applying beaded, crimped and corrugated steel to its various purposes, as well as steel roofing, gutters, shingles, weather boarding, &c.

FRED. W. NOTTINGHAM New Haven, is to build a store that will have a sheet metal ceiling.

DEALERS IN ROOFING MATERIAL in New York City report a better business during the last week or two, although it is not yet up to the standard for the season. Nevertheless, the trade

Sheet Metal Front.

and wordy and confusing statements, giving instead in as few words as possible accurate and actual information, together with price-lists and illustrations of the goods. They have followed out this plan faithfully and as a result the publication is not overburdened with letterpress description, but instead the goods are presented to the eye by carefully executed engravings and brief technical descriptions. The catalogue is divided into three parts. The first relates to beaded, crimped and corrugated steel trimmings, fire proof doors, gutters, rock and brick siding, steel roofing, metallic shingles, steel weather boarding and similar goods. Part second is devoted to conductor pipe, crestings, eave trough and hangers, finials, gutters, cut offs, coping,

look forward with encouragement to an exceedingly good summer business, as the amount of building commenced and in prospect in this section is unusually large.

THE LITHO CARBON RUBBER COMPANY, 130 Fulton street, New York City, report a large and growing demand for their preservative paints, japans and varnishes. They claim that as a preservative paint for iron, tin or other metal Litho-Carbon is exceedingly effective, preventing rust, leaking or wear. It is also recommended for gas pipe and iron castings, as well as for shingled roofs, &c.

JOHN G. TAIT & Co., 100 Mulden lane, New York, manufacturers of roofing felts, coal tar products, water

proof building paper, &c., with factory at 148-150 N. J. R. R. avenue, Newark, N. J., report a very satisfactory demand for their roofing specialties, in which they are offering the trade some new lines this season.

MERCHANT & CO., INCORPORATED, Philadelphia, issue a card in somewhat violent contrast with their usual advertising publications. It is an engraving showing a building, the front part of it broken away and in the last stages of dilapidation and bearing the firm's name over the front door. The occupants are those strange little people of Palmer Cox's creation and who are becoming identified with Merchant & Co.'s specialties. Incidentally, attention is directed, by means of signboards about the building and its neighborhood, to some of Merchant & Co.'s goods.

HENRY HENNINGSON of Jersey City, N. J., is putting a red tile roof on the new City Hall Building, covering the towers with copper and erecting a handsome sheet metal cornice.

JACOB RINGLE of Jacob Ringle & Son, 83 Newark avenue, Jersey City, N. J., has recently returned from a visit to Germany. One of the contracts which the shop is busy with at the present time is a roof and a handsome sheet metal cornice for a church at Yonkers, N. Y.

THE NEWARK SHEET METAL WARE COMPANY, Newark, N. J., have recently received from the Hay Foundry & Iron Works a large cast iron zinc pot for their galvanizing plant, which is to enable them to galvanize gutters and conductors in 8 foot lengths. This pot is of a peculiar shape. The top portion is rectangular, measuring 2 x 3 feet and about 1 foot deep. From the center of this there is a circular pot about 12 inches in diameter and 8 feet deep. This pot will be set in brick work, arranged with a grate and fire chamber at the bottom, to keep the metal within in a molten state. The company also make a line of galvanized sheet iron stove and furnace pipe and adjustable elbows. They make a specialty of valves and plungers for sheet metal pumps. In their cornice department they are finishing the work for the Passaic Electric Railway Company's power house at Secaucus. They are also doing the cornice work on the new school building at Paterson, N. J.

THE GARRY IRON & STEEL ROOFING COMPANY, Cleveland, Ohio, are just finishing the last iron building for the United Salt Company of Cleveland, Ohio.

THE ILLINOIS ROOFING & SUPPLY COMPANY suffered some damage to their stock from water on the 17th inst., owing to a fire which occurred on the upper floors of the building occupied by them at 203 Lake street, Chicago. While the company necessarily suffer some inconvenience, they are not prevented in any way from continuing in business or from promptly filling orders, being ready as before to make shipments from Chicago. They have just issued some attractive circulars calling attention to their specialties. Gilbertson's Old Method, Illinois Old Method, and E. L. roofing tin, Perfection folded lock seam steel roofing, and general roofing supplies.

THE RECENT INCREASE in the demand for slate has caused several old and abandoned quarries in Slatington, Pa., to be reopened and worked again. One old quarry in Slatington, aban-

doned nearly 40 years ago as profitless, is already being operated by a company who claim that the slate is excellent and the supply ample.

THE DECATUR STEEL ROOFING COMPANY, Decatur, Ill., have issued a new catalogue illustrating and describing their products. They are manufacturers of the Jones & Bonbrake patent folded lock seam steel roofing and Bonbrake's patent single fold steel roofing, separate cap roofing, pressed seam roofing, corrugated roofing, V crimp roofing, corrugated siding, corrugated and beaded ceiling, steel clapboards, pressed steel brick, eave troughs and other roofing supplies. Very full directions are given for laying roofs, and essential points are plainly illustrated. Much attention is paid to sheet metal siding, plain and ornamental. Those who are looking for designs in which to finish metal fronts will find a number of them in this catalogue. Cornices and galvanized window and door caps are shown in great variety, as well as ridgings, finials, &c. The book comprises 64 pages.

Trade School at Springfield, Mass.

In *The Metal Worker* of November 17, 1894, reference was made to the establishment of a trade school department in connection with the Springfield Industrial Institute, Springfield, Mass. The initial course of the school, which embraced five different trades, opened in temporary quarters last fall and closed on March 30 last. Its results gave great satisfaction to the promoters of the undertaking. The course of instruction consisted of evening classes in carpentry, wood carving, bricklaying, plumbing and sign painting.

Programme for Season of 1895-96.

We are glad to learn from circulars, forwarded to us by the institute, that in the forthcoming season of the trade school, opening on October 2, 1895, its operations will be considerably extended. Both day and evening classes are to be held; and their number will be increased, including, in the day classes, instruction in plumbing, bricklaying, plastering, stone cutting, sign and carriage painting, cabinet making, pattern making and machine shop practice. Evening instruction will also be given in all these branches, and, in addition, classes will be opened in electricity, tinsmithing, engraving and blacksmithing. A fine new building is in course of construction on a suitable location on the Boston road, between Winchester Park and the New England Railroad. The building will contain a carpentry shop, machine shop, forge room, iron and brass foundries, plumbing shop, shops for bricklaying, plastering and stone cutting, physical and chemical laboratories, mechanical and free-hand drawing rooms, recitation rooms and a large assembly hall.

The trade school, which is only one of the five departments constituting the work of the institute, is under the direction of L. P. Strong. In each of the trades offered a graded course of instruction has been laid out, beginning with elementary work and progressing to the more difficult and complicated stages. The manual instruction is in the charge of skilled mechanics. Theoretical instruction is also given by means of lectures and diagrams. The day classes, which cover a period of from four to six months (the time varying in

different trades), are open daily, during the working week, from 8 a.m. to 5 p.m. The evening classes are intended more for the benefit of young men who are already engaged in trades, but who are desirous of improving themselves. These classes cover a period of six months, the ground traversed being very similar to that of the day classes. In general principles the curriculum throughout the school is founded on the New York Trade School system. At the termination of the courses of instruction, in both day and evening classes, examinations will be held and certificates awarded to those who pass.

Plumbing Instruction.

In the day plumbing class instruction begins December 2, 1894, and continues until April 1, 1895, the session being from 8 a.m. to 4 p.m. A fee of \$45 is charged, to be paid when the name of the pupil is entered. The course of instruction followed includes manual work, such as practice in lead seams, overcast joints, calking, joint wiping of all kinds, traps, setting basins, boiler work, sand bends, &c. In addition to the manual work, scientific instruction will be given in the proper arrangement of surface and waste pipes, and in drainage and ventilation, as follows: Drain, soil and waste pipes, trapping and ventilation of the same, supply pipes, boilers, tank fixtures, trapping and ventilation of fixtures, pumps, &c. Instruction will also be given in the best method of keeping plumbers' books, and a portion of the time will be set apart to teach mechanical drawing. The last named feature is one which is included in each trade course taught in the school. The plumbers' classroom is fitted up with all the appliances of a first-class modern shop.

Machine Work.

The instruction in machine shop practice covers a longer period than that in any other trade course, beginning in September and ending in August. It is, however, a very exhaustive one, embracing not merely machine shop practice but also mechanical drawing, blacksmithing, instruction in the charge of engines and boilers and other matters which are calculated to give the pupil a thorough education as a machinist, with good knowledge of mechanical engineering. The facilities for carrying out this course are said to be very complete. The machine shop is 100 x 50 feet, and is thoroughly equipped to do all kinds of work.

Accommodation for Pupils.

A commendable feature of the institute, which was first adopted in connection with the New York Trade School, is the announcement that living accommodations are offered for pupils, at very low prices, in the institute itself. Furnished rooms, lighted and heated, can be had at from \$1 to \$1.50 a week. Board is also provided at \$3 a week. By this means pupils from distant parts of the country are given a comfortable home at reasonable rates while working at their trades. The president of the Springfield Industrial Institute is David Allen Reed; the vice-president Milton Bradley.

Efforts are being made, it is said, to form a new cordage combination. Business has for two seasons been so unsatisfactory in this line that those interested are attempting to form an agreement on a fair basis whereby competition may be rendered less keen and an equitable range of prices be secured.

TIN PLATES.

SCRAP.

MORTIMER H. CORT, 9 Burling slip, New York, is mailing to the trade and his customers small samples of "Cort's Old Style" IC roofing tin, together with a card calling attention to the merits of the same. Each sheet of "Cort's Old Style" is stamped and resquared and heavily coated with metal. These plates, which are specially made for Mr. Cort, are strongly recommended by him for high class work.

THE AMERICAN TIN PLATE COMPANY, Elwood, Ind., will, it is said, soon add five new mills and eight new tinning stacks, thus increasing their plant one-third and affording employment for about 1000 hands in all.

A PRESS DISPATCH from Duerkirk, Ind., asserts that a new tin plate plant, furnishing employment to about 800 men, will shortly be erected at that place.

WORK has been begun on a new tin plate factory at Franklin, a suburb of Elwood, Ind. The new works will be a four mill plant, employing about 300 hands. It is expected that it will be ready for operation by September.

THE MANAGEMENT of the Beaver Tin Plate Company's works, Lisbon, Ohio, have decided to run their mill non-union on account of the refusal of certain of their union employees to enter into any agreement in regard to the wage scale and other matters, as desired by their employers.

THE buildings of the new National Tin Plate Works, Anderson, Ind., have all been completed. The machinery is now being installed and the plant will be ready for operation by July 1.

THE ANDERSON FOUNDRY & MACHINE COMPANY, Anderson, Ind., have begun the construction for the Monongahela Tin Plate Company, Pittsburgh, Pa., of what is said to be by far the largest tin plate picking machine ever built.

IN the last quarterly list of American tin plate manufacturers, printed in *The Metal Worker* of April 6, omission was made of the name of the Buhl Stamping Company of Detroit, Mich., who have been for several years manufacturing bright tin plates for their own use in the manufacture of milk can stock, to which their factory is largely devoted. They have from the start used nothing but back steel sheets tinned by the palm oil process in their own works. Their tinning equipment consists of three sets, which have put out a steadily growing tonnage year by year. The company advise us that this year's output has been so far larger than ever before, and the quality of their plates has improved in an even greater ratio.

AT THE OFFICE of Geo. H. Ismon, 277 Broadway, New York, agent for the Falcon Tin Plate & Sheet Company, Niles, Ohio, are displayed some handsome samples of the tin andterne plates manufactured by that concern, consisting of coke and charcoal bright plates and six grades of

terne plates. These plates are specimens of some of the first material produced by the Falcon Company after the starting of their tinning department, and do not at all suffer by comparison with the imported brands to which they are claimed to correspond. The Falcon Tin Plate & Sheet Company's works are reported to be now in full operation in all departments. The quality of their black plates has long been acknowledged as being of the best, and the finished plates promise to keep up the high reputation of the firm in this field.

THE STIRLING COMPANY of Chicago have just filled a third order for a 350-horse power Stirling boiler for the American Tin Plate Company, Elwood, Ind.

THE PENNSYLVANIA TIN PLATE COMPANY of New Kensington, Pa., have their plant in a very forward condition of progress and expect to begin rolling black plates very shortly. The plant consists of two double hot roll mills and two double cold roll mills. The tinning department will include seven sets for bright plates and three forterne.

SEVERAL of the daily papers have been commenting on the employment of women as separators at the mills of the Monongahela Tin Plate Company, Pittsburgh, Pa., and the Blairsville Rolling Mill & Tin Plate Company, Blairsville, Pa., which circumstance they regard as an undesirable innovation. This kind of work has for long been done by women in the Welsh mills. It consists of separating or opening the black plates as they come from the shears, and hitherto has been done in this country by boys.

IN the manufacturers' column of the Brooklyn *Standard Union* of April 20 appeared a very excellent portrait of Jacob Meurer, senior member of the tin plate manufacturing firm of Meurer Brothers & Co., 575 Flushing avenue, Brooklyn, together with a very appreciative notice of this popular member of the tin plate trade. Mr. Meurer is highly esteemed among his fellow members of the Manufacturers' Association of Kings and Queens counties.

AT the beginning of March there were 340 tin plate mills in operation in Wales and Monmouthshire out of a total of over 400. According to the Liverpool correspondent of the London *Iron and Steel Trades Journal*, there were in the second week of the current month only about 100 of these mills at work, owing to the strike over the wages question and the efforts now being made by the men's union to maintain the 36-box rule, which the makers generally have agreed to repudiate. The effort to put the prices up by a combination to restrict the make and cause a scarcity does not meet with the approval of the Welsh tin plate trade in general, as they regard such a proceeding as merely playing into the hands of the American manufacturers. It is looked upon as a significant and important feature of the situation that stocks of tin plates at shipping points are running down, being only about

two thirds of what they were a year ago, while the production is considerably less than it was at that time.

ONLY 39 tons of black plates for tinning were exported from Great Britain to the United States during the month of March, as compared with 451 tons in February, which itself was a very small figure, and 2277 tons in January. The total shipments of black plates to this country for the first quarter of the year were 2767 tons, according to the returns of the British Board of Trade.

THE GREAT WESTERN TIN PLATE COMPANY, Joliet, Ill., are now operating two trains of hot rolls and one train of cold rolls, with an annual capacity of 4500 tons of black plates.

THE ERIE CITY IRON WORKS, Erie City, Pa., have just sold a steam plant of 600 horse-power to the Ohio River Sheet & Tin Plate Company, Rochester, Pa., making the seventh large steam plant for tin plate works lately supplied by this firm.

A DISPATCH from Bellefonte, Pa., to the Philadelphia *Ledger* states that ex-Governor Beaver has been making some experiments, at his nail works plant at that place, with a new process for the production of tin plate. The experiments are now said to be complete and the General declares the process to be a complete success. The invention is the joint work of General Beaver and a Pittsburgh iron manufacturer. Application for a patent is pending, and it is stated that mills will be erected at Pittsburgh and Bellefonte to operate on this system, by which, it is claimed, the cost of making tin plates will be reduced to a minimum.

THE TIN PLATE MILL which is being built by the Laughlin Nail Company of Wheeling, W. Va., will be in operation in July. After that date the company will be in a position to furnish the Laughlin brand of black, bright andterne plates. The Laughlin Nail Company should not be confounded with the Laughlin & Junction Company in the same district.

THE project of erecting a tin plate plant at Beaver Falls, Pa., has been abandoned. The citizens of that place could not guarantee a sufficient supply of water, which is the main reason for the giving up of the enterprise.

The following mixture is said to have been used in England with great success for the cementing of iron railings, iron grates to stoves, &c., so effectively as to resist the blows of a sledge hammer. The mixture is composed of equal parts of sulphur and white lead, with about one sixth proportion of borax, the three being thoroughly incorporated together so as to form one homogeneous mass. When this composition is to be used it is wet with sulphuric acid, and a thin layer of it is placed between the two pieces of iron, these being at once pressed together. In five days it will be perfectly dry, all traces of the cement having vanished and the work having every appearance of welding.

The Field Triumph Filters.

Henry Giesel & Co., 43 and 45 Franklin street, Chicago, are manufacturing

creasing demand for water purifying apparatus capable of heavy service. Illustrations are herewith given showing the character of a few of the filters made by this firm. Fig. 1 represents a

daily. A reservoir or storage tank is attached to the right of the filter. For the purpose of more rapidly introducing such filters the manufacturers will for the present put them up on 30 days' trial for responsible parties. Fig. 2 represents an office filter connected with the city water supply, furnished with

Fig. 1.—The Field Triumph House Filter.

the Field Triumph Germ Proof filters, which have recently been put on the market, but have already found their filter designed for use in private houses and intended to be handled by the plumbing trade. As shown it is placed

Fig. 2.—The Field Triumph Office Filter.

way into quite extensive use. These filters are designed for use under pressure, and therefore meet the rapidly in-

on a kitchen wall above the sink and connected with house water service. This will filter from 20 to 30 gallons

Fig. 3.—Filter Tubes.

a waste pipe to the washstand and further equipped with a water cooler of special design. The cut shows portions of the casing broken away to expose the interior. It will be seen that the water cooler is so made that the filtered water is preserved free from contact with the ice, so that any kind of ice can be used in it. The lettered parts are thus explained: A, filtered water in reservoir; B, filtered water to reservoir; C, overflow; D, handle for wash rod; E, perforated brass pipe (tinned); F, filtering tube; G, overflow; H, ice; I, vent on filter; J, water from filter to reservoir; K, pipe for flushing filter; L, handle for turning tube for cleaning; N, waste pipe to sink; O, wash rod; P, feed pipe to filter. The filter tubes are made in several sizes, as partially illustrated in Fig. 3. These are made of clay, of a very fine quality, and are baked in a kiln. Acid has no effect upon them. Heads for the tubes are made of cast iron, galvanized or enameled as desired, and are put on with pure rubber gaskets, the whole being subjected to water pressure before being put into the case to see that they are perfect. The method of cleaning the filter is very simple. Referring to Fig. 2, the handle L turns the filter tube, bringing it in contact with wash rods furnished with a thick strip of pure rubber. The muddy water is then drawn off at a faucet provided for that purpose. No part of the filter case need be removed to clean it. Special sizes are furnished to meet special requirements.

The lumber manufacturers and dealers on the Mississippi River have organized with the object of working in harmony and securing equitable freight rates to points of consumption both east and west of the river.

Suits have been brought by the Westinghouse Company against the General Electric and Stanley Electric companies for infringement of the Tesla patents, which are claimed to be the property of the Westinghouse Company.

(Continued from page 41)

THE FOLLOWING CONTRACTS for heating apparatus were awarded at a special meeting of the Building Committee of the School Board of St. Louis: Columbia School, Missouri Steam Heating Company, using their own system, \$6180. Charles School, Foss & Noble, using the Sturtevant system, \$9634. Benton School, John Ramming, using the Sturtevant system, \$6182. Riddick School, Branch Steam Heating Company, using the Sturtevant system, \$6421. Dumas School, John Ramming, using the Sturtevant system, \$6700; Froebel School, John Ramming, using the Sturtevant system, \$5840. It was decided to place a furnace temporarily in the Harrison School. The recommendation of the sub-committee to pay Professor Kinealy \$500 for his services as an engineer in investigating the school ventilating question was approved by the Building Committee.

THE STRADLING PLUMBING & HEATING COMPANY, Utica, N. Y., have been awarded the plumbing contract for the new Madison Barracks, at Sacketts Harbor.

THE COMMITTEE ON HEATING of the Board of Education, Newark, N. J., held a meeting last week. A contract for the placing of a new boiler in the Commerce Street School, the removing of a boiler from the Franklin Street School to the Elizabeth Avenue School and the erection of a boiler in the Thomas Street School was given to Lyon & McCabe for \$719. The contract for a boiler in the Chestnut Street School and the building of a chimney was given to J. H. Cornish.

B. H. CARPENTER of Wilkes-Barre was called in for consultation and to make a bid on the entire renovation of water closets and ventilation system of the school building at Mauch Chunk, Pa.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C. until May 22 for a low pressure, return circulation steam heating and ventilating apparatus for the U. S. Post Office building at Rockford, Ill. Drawings and specifications can be obtained from the Supervising Architect, Washington, or from the Superintendent at Rockford.

FREDERICK SCHOLEFIELD, 310 South California avenue, Chicago, has the contract for the plumbing and drainage in the flat building of W. Flynn, 4 Edgemont avenue.

ROBERT R. HEANTSCH, 5631 Wentworth avenue, Chicago, is to do the plumbing and drainage in the residence of T. C. Hageman, 4801 Langley avenue.

WILLIAM READ, 345 Forty-third street, Chicago, has the contract for the plumbing and drainage in the flat building of Aug. Hathan, Justine street, near Forty-fifth.

WALTER J. HOGAN, 1087 North California avenue, Chicago, is to do the plumbing and drainage in the flat building of W. Pierce, 1219 Rokeby street.

MINNESOTA is considering the erection of a new State Capitol Building, at Minneapolis, to cost \$1,500,000, including heating and ventilating plant and plumbing system. Bids for the building will be received up to August 5, 1895.

THE CONTRACT for heating the new county clerk's office with steam was awarded to John C. Sullivan of Oswego, N. Y., for \$1453.

Trade Notes.

THE BATES MFG. COMPANY, Birmingham, Ala., have been organized by George P. Bates and a number of other parties to manufacture utensils in Woodenware.

THE QUAST GAS & GASOLINE ENGINE COMPANY, an industry recently established at Bucyrus, Ohio, have commenced the erection of additional buildings which will accommodate about 50 more men. They expect to start operations next week, and are said to have already booked orders for 100 Engines.

THE AMERICAN UNDERFEED MECHANICAL STOKER, the new smoke preventing apparatus, is now being manufactured by the American Stoker Company, at Dayton, Ohio, and promises to add a flourishing industry to the Gem City.

WE HAVE an encouraging report from the Rutland Fire Clay Company, Rutland, Vt., that their sales are good and collections reasonably prompt, and as their business covers 35 States it is an excellent indication of the general condition of trade throughout the country.

P. H. KEEVAN of Kenosha, Wis., manufacturer of Brass Goods, will locate in Lorain, Ohio, occupying the buildings recently used by the Young Mfg. Company. His plant will employ about 50 men.

E. T. BARNUM, Detroit, Mich., is manufacturing wire signs with open net work of galvanized iron, to which painted metal letters are securely attached. The signs are made to order, from the smallest size to 300 feet in length, for use on stores, banks and factories; the larger sizes to be placed on the top of buildings. The smaller sized signs, to suspend, can be read from both sides. The manufacturer calls attention to the fact that the signs are not affected by fire, wind or weather.

THE NEW HAVEN COPPER COMPANY of 294 Pearl street, New York, where they have been located and doing business since 1850, will remove their office and salesroom to their mills at Seymour, Conn., on May 1, where they will fill all orders for Sheets, Copper Bottoms and Cast Steel Augers and Bits. Charles K. Hayes will still continue to represent them in the capacity of traveling salesman.

AUSTIN & DOTEN, manufacturers and dealers in Tin Plate and Metals, 92-102 North street, Boston, Mass., are offering a new brand of Black Sheet Iron, made especially for tinsmiths' work, under name Austin's Clean Refined, and it is to be sold at the price of ordinary refined. The special features of this brand are that it is particularly clean, soft and smooth, qualities that are generally appreciated by hand workers in Sheet Iron.

IN THEIR advertisement elsewhere in this issue the Beaver Tin Plate Company, Lisbon, Ohio, direct the attention of the trade to their Beaver brands of Charcoal, Coke and Terne Plates. The quality of these Plates is guaranteed by the firm and inquiries of the trade are solicited. In connection with the advertisement the trade-mark of the firm is shown, being a picture of a beaver perched on the top of a number of boxes of Beaver Plates.

P. J. CONROY, Paschall, Philadelphia, advises us that business in his

Refrigerator Fastener, which is well known to the trade, has been twice as large this year as last. He states that he has enlarged his facilities for manufacturing Refrigerator and Ice House Trimmings, which are the only goods he makes, and he is accordingly in position to fill large orders in that line very promptly.

THE CENTRAL STAMPING COMPANY, 23-25 Cliff street, New York, have for some time been making very extensive alterations and improvements in their large Tinware factory at Newark, N.J., some parts of which have been entirely remodeled. Among other features, a complete electric plant is now being introduced, and the tinning department is receiving special attention. When the alterations are completed, which will be in about two months' time, the Newark factory will, it is said, be one of the largest and most complete examples of a modern Tinware plant in this country. The company report that both their factories, at Newark and Brooklyn, are in steady operation with a very considerable volume of orders in hand.

L. M. DEVORE & Co, Freeport, Ill., is putting on the market a non-heating swell handle Lid Lifter, which is an improvement on the Lifter heretofore offered by the company. The principle is the same as employed in the former Lifter, but the handle is now made in a form more suitable to the hand and, where desired, a loop is added by which the Lifter may be hung up.

Bartlett's Thermograph.

The Bartlett Brothers Thermograph Company, 176 Euclid avenue, Cleveland, O., are placing on the market a patented thermograph for indicating temperature or to be used as a fire alarm. It is adapted for use in cold storage houses, public buildings and greenhouses. The device consists of a cabinet containing an electric switch-board, dials and push-buttons, to be connected with specially constructed thermometers placed wherever desired. The object of the device is to enable the janitor to find the temperature of any room of a large building without making a tour of inspection. By moving the switch to the number on the board corresponding to the room of which he desires to know the temperature, the hand will point to the temperature on the dial that is registered by the thermometer in the room. A fire alarm attachment is so arranged that when the temperature in a room reaches 100, it sets in operation a 10-inch vibrating gong located where it will attract attention. Such an apparatus installed in a nursery or greenhouse can be arranged to give the alarm when the temperature of any department has been reduced to a degree which is injurious to plants.

About 5000 New Jersey operative potters have organized a national union, which has been affiliated with the American Federation of Labor.

Bids will be received by T. H. Williamson, Homestead, Pa., until May 4, for the furnishing of 20 tons of 6-inch cast iron pipe.

The Japanese Government will, it is said, place in England orders for several war ships, to be built on lines suggested by the experience gained in the late war

STOVE TRADE NOTES.

The Stove Secretaryship.

We have received several letters recommending various candidates to the favor of the members of the National Association of Stove Manufacturers. After earnest consideration we decided to publish all these letters in this issue, so that the members of the convention, when they meet at Chicago next week, may have this interesting collection of epistles in complete form to ponder over, and it may perhaps assist them in coming to a satisfactory conclusion. On a careful perusal of the letters there would seem to be no difficulty in finding a person thoroughly qualified to fill the position of secretary. So many names are presented, however, that the difficulty would appear to lie in determining which of these ideal candidates to support. And yet perhaps the question may not be so complicated as one would suppose, because we understand that some of the persons named are not really candidates in the sense of personally seeking for the office. They have enthusiastic friends who would like to see them honored in being selected to fill the office, and who think that they would serve if they were called—to adopt a clerical phrase. We disclaim any partnership whatever in this matter, preferring to remain entirely neutral with regard to the individual candidates, and strictly refraining as in the past from any attempts to influence sentiment for or against any person. There may be a number of other candidates than those who are named in the accompanying letters. If so, their omission from mention among those here presented is simply because their friends have not favored us with a communication on the subject. The omission of a presentation of their claims for support is therefore not to be charged to us. The letters are as follows:

William T. Bradberry is Named.

Editor The Metal Worker:

Sir: I would like to call the attention of the members of the National Association of Stove Manufacturers and also of the Stove Founders' National Defense Association to a man who, in my judgment, is eminently qualified to fill the responsible position of secretary. The gentleman whom I have in mind is a practical manufacturer of over 30 years' experience in managing a stove business. He is conversant with every department, from the foundry to the counting house, and in all of them he is the peer of any man to be found to-day in the ranks of the stove manufacturers of America. He has for years been actively identified with the work of both associations, but has particu-

larly distinguished himself in the work of the Defense Association, assisting materially in the settlement of numerous disputed questions between manufacturers and workmen which might have led to grave troubles but for the interference of one so well informed and clear-headed. I write entirely without the knowledge that he would accept the position if it was tendered to him, but in my opinion he is the right man for the position, and his fellow members of the national associations might perhaps be able to prevail upon him to forego his personal interests for a time in looking after the larger interests of the trade in general which he has so long had at heart. I therefore take great pleasure in naming William T. Bradberry of Pittsburgh, president of the Anshutz-Bradberry Company, as my choice for secretary, and hope that my fellow members of the national associations will join with me in desiring him to serve.

Very respectfully,
STOVE MANUFACTURER.

Samuel T. Dickinson.

Editor The Metal Worker:

Sir: Your article on the stove secretaryship hit the nail exactly on the head. We want and must have a practical man as secretary in order to insure the satisfactory administration of the duties of this important position. He must not only be practical, but he must be in possession of other important qualifications, such as a ready pen, a fluent tongue and a natural propensity to keep abreast of the times and in touch with the advancement made in methods of doing business and handling important questions. These qualifications are all possessed in an eminently satisfactory degree by Samuel T. Dickinson, late of the Lehigh Stove & Mfg. Company, Lehigh, Pa. Mr. Dickinson is in the prime of life. He served an apprenticeship under H. M. Norton of Easton, Pa., learning the tinning trade as applied to stoves and hot air furnace setting. Seeking a wider field than that inclosed by the walls of a tin shop, he eventually became a traveling salesman for the stove house of Shantz & Keeley, Royersford, Pa. He was with this house for a number of years until the firm changed to Oliver B. Keeley & Co., and removed their works to Columbia, Pa. During this period he traveled through the Southern States, through the Central States, some through the Eastern States, and through the stove territory in the West which is adjacent to Chicago and east of it; so that he is familiar with the territory, the manufacturers, the people and the local workmen.

When the Keeley Stove Company were formed several general managers were tried, and Mr. Dickinson was finally taken off the road and placed in entire charge of the manufacturing plant, where he looked after the finance, credit and bookkeeping departments as well as the foundry, looking after the mixtures of the irons, the pattern shop and the employment of the men. A number of new goods which proved successful were brought out in his ad-

ministration. Mr. Dickinson next went to the Lehigh Stove & Mfg. Company, Lehigh, Pa., taking charge of this plant when it consisted of a cupola and a series of sheds and shanties, with a line of patterns which had been repudiated by the market and had brought the foundry to a condition closely approaching collapse. Mr. Dickinson took charge of the selling, the books, the mixtures, the foundry management and the production of new patterns, bringing the company to a profit paying basis. In many respects Mr. Dickinson is well qualified for the secretaryship. As a practical man he is certainly well equipped to discharge its duties. His literary qualifications are equal to anything expected from the one who shall hold this office. Further, he is accidentally and perhaps fortunately unattached at present, so that he is available for the place. If Mr. Dickinson will consent to be a candidate I am sure that he will be found to have a host of friends in the stove trade ready to support him for the position. Yours truly,
CONESTOGA.

Ex-Secretary T. J. Hogan.

Editor The Metal Worker:

Sir: It seems to me that this is not a good time to try new men in such an important position as that of secretary. The questions now coming before the trade for settlement require in their decision the ripest experience and the soundest judgment. Several times within the past year we were hovering on the brink of a volcano, not knowing at what minute an eruption would break forth. Thanks to temperate counsels and the coolness of those in charge of national matters all danger was averted, and for a little time we are permitted to see our way clear over a good road. But we are in the midst of unsettled times. Business is not yet in a healthy condition. The fever of unrest is in the blood of many. On the one hand are manufacturers who are anxious to increase their sales and make more profit out of their plant. On the other hand we have workmen whose earnings are very meager because they are not employed on full time, consequently they are not entirely contented and are too often ready to make exacting demands. Inasmuch as we have in our membership a man who has made a very acceptable secretary, I would ask, Why not endeavor to induce him to again take up the work and serve in that position? I allude to J. H. Hogan, now of the Bridge & Beach Mfg. Company, St. Louis. With him the work of the office would not be experimental. He would take up the lines as though he had just laid them down. Manufacturers and workmen all know him and have confidence in him. It would be a happy solution, indeed, if we were able to prevail upon Mr. Hogan to again take the secretary's chair.

Truly yours, VULCAN.

Samuel Smyth.

Editor The Metal Worker.

Sir: I understand that Samuel Smyth of Pittston, Pa., is a candidate for the position of secretary. As Mr. Smyth is

very well known to a large majority of the stove manufacturers it may perhaps be unnecessary for any one to write or plead in his behalf. I merely take this occasion, in view of the invitation recently extended by you, to say to the stove trade that if the convention should decide to elect Mr. Smyth secretary I believe the position will then be ably and very creditably filled. Mr. Smyth is familiar with all the details of the stove business, so that he is ready to take up the work of the secretary without loss of time in learning the ropes; and besides he has such a wide acquaintance among the stove men that he cannot fail to make himself highly useful to them. He is careful, thorough and prudent, not impulsive or easily influenced, and would make the association a very good secretary.

Respectfully yours, OAKWOOD

B. W. Dodson Is Nominated.

Editor The Metal Worker:

SIR: I most emphatically disagree with some of the conclusions reached in your editorial entitled "The Stove Secretaryship." Especially do I disapprove of the assumption that the secretary must be a practical man. I take it that you mean to say the secretary must, at some time, have worked with his own hands in a stove foundry, hustling flasks, screening sand, preparing molds, making cores, &c., or else he is not fitted for the position. Why you might as well say that a man cannot run any sort of a factory unless he had first worked at a bench or a machine in some part of it. This is absurd. There are many successful men to-day in all branches of manufactures who could not take the place of the humblest workman in their factories and turn out the work he is easily doing. They know when it is done right, and they know how much should be done in a given time, and they know what it should cost, but they couldn't do the work themselves if their lives depended on it. I would like to see Mr. Dodson elected to fill this position. He has all the qualifications for a capital secretary. He wields a trenchant pen, knows the stove trade through and through, has positive convictions, stands like a rock when he knows he is right, yet is ready to hear the other side and will deal fairly with all men. Perhaps he never actually put a pattern in sand with his own hands, yet that should be no bar when a man has the full knowledge of the business which Mr. Dodson possesses. I am not aware that he is willing to accept the position, but if he will take it there is no doubt that he will fill it to the entire satisfaction of the members of the stove trade. Yours faithfully,

LID LIFTER.

E. W. Peck Is Brought Forward.

Editor The Metal Worker:

SIR: The election of a secretary will be one of the most important matters to come before the approaching stove convention. It is highly essential that in this matter the convention should make no mistake. I have heard a number of names of possible candidates suggested, but none of them has struck me so favorably as that of E. W. Peck if he could but be induced to accept. Mr. Peck has the esteem and confidence of the entire trade in a remarkable degree. Few men, in fact, are so universally popular as Mr. Peck. He is a man of great ability and has at his fingers' ends all the knowledge needed for the successful discharge of the secretary's functions. If he would

consent to serve I venture to say that the association would look no further, but that everybody would say, "He is just the man we want."

Yours truly,

JOHN SMITH.

Albert Moffat Recommended.

Editor The Metal Worker:

SIR: Permit me to suggest through the columns of your valuable journal that Albert Moffat would in my estimation make an ideal secretary. Mr. Moffat is a veteran manufacturer, but his long years of service have not impaired his usefulness and he is to day one of the most vigorous and progressive men we have in our ranks. He is well known to the trade through his long connection with the Collins & Burgie Company of Chicago, a very successful concern, whose place in the trade would have long ago been much more prominent if Mr. Moffat had been permitted to give his energy full swing. He is a man of eminently sound mind and possesses the judicial faculty in a rare degree. He has practical knowledge, added to a most persuasive manner and a very original method of expressing his ideas, which carries conviction to the minds of his hearers. If Mr. Moffat is available, of which I am in some doubt, and would consent to be a candidate there are few men who could command a larger following.

Yours truly,

WESTERN MANUFACTURER.

Meeting of the Stove Associations.

Official announcement has been made from the secretary's office that the Stove Founders' National Defense Association will meet at the Auditorium Hotel, Chicago, Ill., on Tuesday, April 30, and that the National Association of Stove Manufacturers will hold their annual meeting at the same place on Wednesday, May 1.

Resolutions on the Death of D. M. Thomas.

At a recent meeting of the Stove Manufacturers' Association of Eastern Pennsylvania the following preamble and resolutions were adopted:

Whereas, Death has suddenly and unexpectedly removed D. M. Thomas, secretary of the National Association of Stove Manufacturers, from the field of his earthly labors.

Resolved, That by his death the stove manufacturers of the United States have suffered an irreparable loss, and the members of the Stove Manufacturers' Association of Eastern Pennsylvania are called upon to mourn the departure of one, formerly a member of their organization, for whom they had the highest and most sincere regard, and who for many years evinced a special personal and official interest in the welfare of the stove manufacturers of this district;

Resolved, That no acknowledgment of his labors as secretary of the National Association of Stove Manufacturers can adequately express the value of the service he rendered to the stove manufacturing industry of this country by the keen intelligence, the remarkable energy and the unceasing industry with which he discharged the duties of his important position;

Resolved, That the influence of his arduous labors for the promotion of

friendly relations and unity of policy among stove manufacturers will long be felt as a salutary force whose benefits it is not possible to estimate;

Resolved, That we extend to his stricken family the assurance of our sympathy in the great bereavement and sorrow that have come to them through the sad and untimely death of the husband and father who was so dear to them.

W. S. STEVENSON, President.

CHARLES S. PRIZER, Secretary.

WM. M. STAUFFER, Treasurer.

WM. L. McDOWELL,

FOR STOVE MANUFACTURERS' ASSOCIATION OF EASTERN PENNSYLVANIA.

The Ohio Stove Trade.

Encouraging reports of the present and hopeful views of the future are characteristics of stove founders, as they are of other lines of business at the moment, and the same stimulus which has awakened trade in produce has made an impression in the stove industry. For the past month or six weeks the progressive foundries have been busy changing old patterns or creating new models, either to comply with trade requirements made necessary by competition or horn of a desire to lead in the business by anticipating reforms which would be required by the more general realization of what is useful, comfortable, economical and healthful.

Those who have succeeded in perfecting their new fall lines have already obtained valuable points respecting the selling qualities of their specialties, and many new and handsome cuts and catalogues which are coming to hand indicate that manufacturers are wide awake. At not a few foundries stocks of fall goods are being prepared, in all stages of process from the sand to the mounting room, giving fuller and more satisfactory employment to all hands. The general verdict is that the spring trade has been better than it was in '94, and not a few foundries report favorable comparisons with two years ago. Salesmen who are testing the market and already canvassing some for fall goods send encouraging reports to their principals respecting the outlook.

For once, at least, the active foundryman who has taken time by the forelock—succeeded in being ready—has the satisfaction of knowing that the goods prepared with such care are about to appreciate in value, and the prospect of larger profits as well as increased trade is a pleasant one to contemplate.

Pig iron of all grades has risen, and the tendency is for a further advance. In fact, another rise of 25 cents per ton is momentarily anticipated. The upward movement has already stimulated the buying, sales in this section during April being equal to, if not exceeding, those of March, when the largest sales in the history of the trade were made. In some respects the April buying is more significant, as the contracts were of smaller individual amounts yet equal

in tonnage. In March pipe works bought heavily, while in April it was the general trade and smaller consumers that contracted. The outlook is certainly bright and there is every reason to feel encouraged.

The Wage Question at Dowagiac.

We have the following letter from Fred. E. Lee, general manager of the Estate of P. D. Beckwith, Dowagiac, Mich.

I have read with considerable interest the article in your last issue headed "Dowagiac Restores Wages," and I beg to say that the report as given by you is more or less correct, but the situation is this: As you know, we made a reduction in the price of our stove, believing that with the extreme low price of raw material and the great purchasing power of a dollar stoves should share in the general reduction of manufactured articles. As you know, we run a shop making only Round Oak stoves, and it does not require the skilled molder to do our work that it does to make a full line of goods, and further, our appliances are better than those in any shop that I know of. We made a reduction in our wages of about 10 per cent., and this would allow our molders to make \$2.90 a day, which, for our class of work, I still feel is a fair wage considering the times. Of course you will understand that the stove manufacturers tried to get us to advance our selling price to something near the basis of last season, but in our judgment we did not think it was the proper thing to do, so declined. You will remember that this took place about the middle of January and we had reduced the wages the middle of December, when we started up for this year's run, and as far as I know all the men were well satisfied with the wages we were paying; but within a few days after we had given our final answer to the other manufacturers about our selling price trouble began to be stirred up in our factory by parties from abroad, which finally culminated in so much dissatisfaction that I closed the works for a couple of weeks to give our molders an opportunity to think the situation over. Then I gave them notice that we were going to start the plant on a certain Monday morning and we would like to have them come to work, but all the Union men staid out. I filled the places with new men taken from the inhabitants of our city whom we taught how to do our work. These new men were not molders at that time, but owing to the skill of our foremen and the excellence of our appliances they were soon able to turn out our usual amount of work and to do it just as well as it had been done by the old men, and so far as we were personally concerned the strike situation was very soon settled. But it appears the other stove manufacturers demanded of the Iron Molders' Union a reduction of 15 per cent., to take effect the 6th day of May, and based their request on the fact that we had made a reduction in our wage scale, otherwise they would not ask it. Well, after a number of conferences with the officers of the Iron Molders' Union we determined that we did not desire to be instrumental in reducing the wages in other shops, and it was satisfactorily proven to us that in case we restored the wages of 1894 the molders of the other factories would be paid the same old wages. In view of these facts we restored the wage

scale of 1894, to take effect the first day of May, we to retain all the new men in our employ that were competent to do our work. Of course, in filling vacancies, should any occur, we expect to give the preference to the old molders.

Now, I have gone into this matter to considerable length, but this is the exact status of the affair, and I will further add that the fact that we have restored the wage scale of 1894 will not cause us to advance our selling price, as we have improved our appliances this last year to such an extent that we think we can make a little money at the prices we are now selling, and in the present depressed condition of business in the country we think our position is the just one to take.

ODD PLATES.

A LETTER from J. Elwood Yeager, 56-58 North Second street, Philadelphia, sales agent for the Spring City Stove Works, states that he is rearranging his sample room and giving it a thorough overhauling, adding some new show tables and refreshing its appearance with a coat of paint inside and outside on the front of the building. He is displaying a full line of Jewel gas and gasoline stoves. He is also showing the Splendid oil cooking stoves and the Puritan lamp stoves and gas hot plates. He makes a specialty of lamp and oil stoves for both heating and cooking. Samples of the New Era line of ranges and parlor stoves for coal still occupy a conspicuous position.

J. CHESTER WILSON read a paper on electrical heating before the Engineers' Club, at Philadelphia, last Saturday evening.

THE NORTHFIELD FURNACE COMPANY is the name of a concern which has just been organized in Minneapolis, Minn., for the purpose of manufacturing the Riddell wood and coal furnaces, steam cookers, tank heaters, &c. We understand that the new concern will erect a factory on Mill square, near the Post Office, in the city named. The organizers are W. H. Riddell and W. W. Maguire.

THE STANDARD RANGE & STOVE COMPANY, which recently consolidated with the Terra Haute Stove Works, Terra Haute, Ind., are now in operation and turned out their first range during the week ending April 13. E. J. Kinz, the former owner of the old works, is said to have sold his interest in the new concern, and the superintendency of the foundry has been given to James Boyle, who hails from Salem, Ohio. The new plant is running with a force of 25 men, and the stoves turned out are attractive in appearance, while constructively they embody a number of novel features.

THE ECLIPSE STOVE COMPANY, of Mansfield, Ohio, are distributing folders illustrating and describing some of their leading specialties, prominent among which may be noted the Neptune Eclipse four-hole wood range, with all modern improvements. The ornamentation is neat, yet effective, and the construction first class in all respects. Another novelty is the Veata Eclipse, a four-hole cook stove for coal, made with extra large flues, cut top, interchangeable end linings, draw hearth, shaking and dumping grate, patent oven door opener and nickel trimmings. The Model Eclipse is another attractive cook which the company have brought out for burning wood as a fuel. This is made in six sizes, has ventilated oven, cut top and

center, heavy ring covers, draw hearth, &c.

JOHN G. WATKINS, formerly foreman at the works of the Littlefield Stove Company, Albany, N. Y., has accepted the position of superintendent of the molding department of the Baxter Stove Company, at Mansfield, Ohio.

THE STANDARD LIGHTING COMPANY of Cleveland, Ohio, have found it necessary to open a store at 54 State street, Chicago, in order to supply the increasing demand for New Process gas and gasoline ranges. The company have secured commodious quarters at the address given and they expect to occupy them on and after the first of May.

THE CHAMPION STEEL RANGE COMPANY, formerly known as the Superior Range Company of Cleveland, Ohio, have issued a folder illustrating the steel ranges which they manufacture. These goods are offered under the names "Champion" and "Marquart," and embody the modern improvements. The fire box is lined with 2-inch Savage fire brick and fitted with duplex grate. The oven is so braced that the plates cannot warp, while the oven opens down, forming a convenient shelf. The makers state that the door is so balanced inside that it can be opened and shut with the greatest ease, while the latch is closed with a spring and cannot be opened except at the pleasure of the operator. Various sizes of these goods are manufactured adapted to meet the requirements of family, hotel and restaurant use.

BRIDGE, BEACH & CO. of St. Louis, Mo., Portland, Ore., and San Francisco, Cal., are distributing circulars descriptive of some of the new goods that they are offering to the trade this season. Among the number is a new patent Franklin, designed for using coal as a fuel. It is made in three sizes, has round fire pot, heavy sheet steel back, heavy sectional linings above the fire pot, which support the deflector and protect the back, draw center shaking grate and large ash pan. The Superior wood base heater is another attractive novelty, possessing the modern features of construction, and is ornamented in a rich and artistic style. Nickel is judiciously employed, while the urn which surmounts the stove is a combination of bronze and nickel. The stove is made in two sizes, No. 22 taking wood 23 inches in length, while No. 24 takes 24-inch wood. Another interesting construction is the Superior steel range, which the company are offering in four sizes and numerous modifications. This is made of cold rolled wrought steel, has large, well proportioned oven, the bottom of which is of heavy No. 10 gauge steel which will not warp, drop oven door which forms a convenient shelf when let down, sectional top, large fire box fitted with improved duplex grate which is easily removed, drop feed door, extra large balled ash pan and polished copper reservoir having a capacity of 15 gallons. The company state that when pressure boilers are used they can furnish an L water heater, which is made extra heavy, tested to 160 pounds pressure and tapped for 1-inch pipe.

A CIRCULAR has been received of the Nugent moist warm air furnace, made by Thomas Nugent, 214 East 80th street, New York. The furnace is shown both portable and brick set, and is made with a fire pot lined with soapstone, each stone having its separate chamber, which is said to prevent overheating of the surface and excessive

dryness of the air which passes over it. A dome rests above the fire pot, from which indirect flues are taken, giving additional heating surface and causing the smoke to travel 30 feet before leaving the furnace. The furnace is also provided with a direct and indirect draft damper and special form of governor. One of the features of the furnace is the method of moistening the air. An evaporating pot is placed inside of the furnace in such a manner as to distribute the moisture throughout the furnace. This pot is connected with a tank on the outside of the furnace, which is supplied with water from the regular service of the building and controlled by a ball cock. A special evaporating attachment is also shown, by which each pipe on a furnace can have a separate evaporating pan, all being connected together by means of a 4-inch pipe which runs from them to the supply tank with its ball cock service. A door is placed in each of these moistening attachments by which examinations can be made when desirable.

GRAFF & Co. of 208 Water street, New York, commenced on Monday of this week running their works at Elizabeth, N. J., full time. For the past few months the foundry has been running only three or four days a week. The company consider the outlook encouraging for the furnace trade.

THE B. C. BIBB STOVE COMPANY, Baltimore, Md., after a shut down of about a month for stock taking and repairs, started up a few weeks since with a full force. We understand that on the 14th ult. there was a special meeting of the stockholders called for the purpose of modifying the by-laws of the company and also to elect a successor to the late president, B. C. Bibb. A. W. Stehman was elected president, and H. G. Carey, for many years connected with the concern, was elected a director. The company are this season making a specialty of nested stove pipe, a feature of which is an effective locking contrivance which prevents the pipe when put together from slipping, collapsing or crushing.

THE NOYES & NUTTER MFG. COMPANY, Bangor, Maine, have brought out a new wood furnace which they have named the Kineo. It is constructed in such a way as to secure great strength, heating capacity, a ready passage of a large volume of hot air and economy of fuel. Its arrangement of parts is such that the heated gases are freely admitted from the fire box into the radiator, which, with hot air pipes, is heated to a high temperature, thereby securing a ready passage of a large volume of hot air through the receiver of the furnace into the distributing pipes. The radiator of the Kineo furnace is made of steel, thus rendering it strong and durable.

F. P. GLAZIER & Co., operating the Chelsea Stove Works, at Chelsea, Mich., have practically completed the work of rebuilding the structures destroyed by fire in March, and at the date of latest advices expected to have everything in running order this week.

E. K. CONANT is closing out his gas stove business on West Fourteenth street, New York, preparatory to embarking in the real estate business at 206 Broadway, New York, on May 1.

C. EMERICH of Columbus, Ohio, write that they are adding a new line of four-hole ranges and four-hole cook stoves for wood, and a handsome low priced oak stove in four sizes to their

assortment. They have their full force at work at the foundry, and are turning out the usual number of stoves.

THE GRANDER STOVE COMPANY, Royersford, Pa., are making some additions to their line of ranges for the coming season. Venus is the name of a new six-hole high grade range with end hearth, elevated warming closet and with or without reservoir. Another new range is the Vigilant, a six-hole range in two sizes, similar in construction to their well-known Shiloh range. They will also have a new pipe shelf, designed especially for second-class ranges.

FLOYD, WELLS & Co., Royersford, Pa., will this season introduce, under the name Bright Rosemont, a new single or double surface burning square parlor heater with full nickeled trimmings and urn top. The firm are increasing the capacity of their works by the addition of some new machinery.

THE BUCKWALTER STOVE COMPANY, Royersford, Pa., are augmenting their line of ranges by the addition of the Sun Canopy, a new six-hole range, similar in construction to their Star Canopy. The same range with a solid end hearth will also be known as the Perseus Canopy. Their Apollo range is to have a new base and is to be re-ornamented. Their Art Canopy will also undergo a change in its ornamentation, and will have a cut top instead of a solid top as heretofore. Their line of heating stoves will be unchanged, with the exception of their Happy Greeting heater, which is being remodeled. The company have just completed arrangements with the Chicago Stove Company to handle their goods in the West.

IT WAS ERRONEOUSLY STATED IN *The Metal Worker* of April 20 that Moser, Wehrle & Co., Newark, Ohio, had shut down because of an overstock of stoves. We are advised that the reason for their closing was that they might make some necessary repairs and improvements in their plant that could not have been made while the works were in operation. We understand that the works are about to start again, and that the orders on hand are sufficient to keep them busy for a long time.

THE SAFETY FURNACE PIPE COMPANY, Detroit, Mich., issue a catalogue that is of more than ordinary interest to the furnace trade. It carries on its front cover the wise precept "Don't throw me in the waste paper basket. You may not need me to-day but to-morrow I may be of service to you." Those who keep the catalogue against the day when they find it necessary to use furnace pipe will be interested in looking over its pages. The first part is a general catalogue calling attention to the various furnace fittings which are illustrated and priced. The latter pages, or rather split pages, are arranged to show the combinations between various forms of pipes. By turning over alternately the upper and lower portions a very great variety of combinations can be effected and the relationship of the parts exactly shown.

THE UNION STOVE LINING WORKS, Taunton, Mass., were damaged by fire to the extent of \$2000 on April 24. The loss is covered by insurance.

THE MT. PENN STOVE WORKS, Reading, Pa., are working on some new goods which they expect to have in readiness for the coming season. They will also shortly place on the market a new system for heating small houses by hot water in connection with a kitchen

range. As the apparatus will possess some economical features the trade will no doubt be interested in its appearance.

MEMORANDA.

BUHL STAMPING COMPANY, Detroit, Mich., have issued a revised illustrated price-list of their "Buhl" cheese factory milk cans and milk can stock, including the Buhl patent "H" handle, their latest improvement, to which special attention is drawn in the circular. The milk cans are made in every known pattern and size.

RICHARD LYNEX, proprietor of the Penn Wire Works, 428 Walnut street, Philadelphia, has sold out his business, plant and stock to W. W. Shoe, who will continue the business at the same address. The new proprietor has made some alterations and improvements to the factory building and plant, and is calling attention to his facilities for supplying the hardware trade with dog muzzles, gas protectors, baskets and the usual line of wire goods handled by them.

THE ILLINOIS STAMPING COMPANY, Deering street and Archer avenue, Chicago, are installed in a large four-story and basement building, occupying a ground space of 60 x 100 feet. They will make a general line of stamped ware, including copper and nickeled utensils. The president is C. D. Milne, who was formerly manager of the Rochester Stamping Company, Rochester, N. Y. M. J. Barker is vice-president and C. A. Miller is secretary and treasurer, both men of practical knowledge of the business. The company have a capital stock of \$40,000.

THE CENTRAL STAMPING COMPANY, 23-25 Cliff street, New York, have issued under date of April 15, 1895, a new illustrated catalogue and price-list of Galvanized Sheet Iron Ware, including Wash Bowls, Baths, Fire and Water Buckets and Garbage Buckets, Ash Cans, Oil Cans, Dippers, Measures, Slop Jars, Tea Kettles, Pails, Dish Pans, Coal Hods, Watering Pots, &c. The company are now making one of the most extensive lines of Galvanized Ware of any concern in the United States.

WAVERLY STAMPING COMPANY, Waverly, N. Y., have begun the manufacture of a line of cooking utensils composed of aluminum and steel. The sheets are rolled separately, the combination being effected when the vessels are struck up. As the inner metal is entirely aluminum the manufacturers believe all the sanitary qualities are obtained, at the same time producing a substantial vessel not easily injured, at considerable decrease in cost, as compared with similar articles made entirely of aluminum. The handles are made of steel and tinned. So far the line manufactured includes Kettles, Sauce, Fry, Pudding and Milk Pans, Pie Plates and kindred articles of this character, the intention being to extend the line as is found advisable. The goods are marketed through the Avery Stamping Company, Cleveland, Ohio, as general sales agents, who are represented in New York and adjacent territory by W. W. Ferry, 88 Chambers street. A full line of samples will be found at the latter address.

The Chinese Government have concluded a large loan, at 6 per cent., from a syndicate of Hamburg bankers.

TRADE REPORT.

The Iron Market.

Those outside of the Iron trade seem to know more of an advance in prices than the majority connected with the industry. The feeling is undoubtedly better, but the newly acquired strength is not yet herculean. To some extent the actual advance in prices is masked, because the start has been made from a lower level than sellers have been willing to acknowledge. We have heard very little of record breaking prices during the last month, and that in itself is a proof of some improvement. The reason why higher cost, brought about by dearer raw material, has not been reflected by correspondingly better figures for finished goods is that the majority of producers are still working on cheap materials and are giving their advantage away.

Apparently furnacemen are resisting vigorously the higher prices for Coke, but even if the makers do not at once secure all they ask for they are sure to obtain a good raise above the starvation level of the last year.

Quite a lively business has been done in Southern Pig Iron, our Cincinnati correspondent noting sales of about 50,000 tons, of which 30,000 tons was done by one house. Chicago, too, reports a heavy business, both in local and in Southern Irons. It is probable that the majority of buyers were given a hint that a stand for higher prices would be made and were induced to avail themselves of options out. The leading Southern furnace companies announced a general advance of 25 cents per ton, and according to our Birmingham correspondent have actually made sales at an advance. In other markets the matter has not apparently progressed quite so far.

There is a rumor that a sale of 5000 tons of Southern Foundry Iron has been made for shipment to England. The report is not confirmed, however. We know, however, that a number of sample lots have been shipped to England and to Italy. Reports concerning them have not yet come to hand.

Pig Iron.—There has been a fair amount of business in New York and in New England at old prices. The Southern furnaces have advanced prices, but have not yet made any sales at an advance in this district. Quotations on Northern Irons have not changed. We quote \$12 @ \$12.50 for No. 1; \$10.75 @ \$11.25 for No. 2, and \$10.25 @ \$10.50 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.50 @ \$11 for No. 2; \$10.25 @ \$10.50 for No. 3; \$10.25 @ \$10.50 for No. 2 Soft, and \$10.75 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$9.75 @ \$10.

The feeling in the Philadelphia market is firmer, and it is believed that prices average 25 cents better than during the preceding month. One reason for believing that there is a genuine improvement is found in the fact that sellers are willing to admit things today that were carefully guarded secrets two or three weeks ago. There is more

business doing and prices average better than they did, but there is no buoyancy to the market. Sales have been at prices as follows for Philadelphia, and 30¢ @ 50¢ less for deliveries at points within 100 miles South or West:

Standard No. 1 Foundry X.....	\$12.00 to \$12.50
Standard No. 2 Foundry X.....	11.25 to 11.50
No. 2 Plain.....	10.75 to 11.00
No. 2 Soft.....	11.50 to 11.75
No. 2 Soft.....	10.75 to 11.00

A very heavy business is reported to have been done in local Foundry Iron in the Chicago district. Sales have comprised a number of round lots ranging from 1000 to 2500 tons for delivery through the year, while smaller trades were numerous. More business is in sight, so that the buying movement is by no means ended. Prices are very firm. Lively times have also been experienced in offices of Southern furnace companies. Firmness in prices and intimations of an advance caused buyers to come in freely to cover their requirements at existing rates and a great deal of business was booked for future delivery. Much of it was taken subject to acceptance by furnace companies, so that it is not known yet what the actual volume of sales has been. One instance occurred in which a large house directed its branch here to cease taking orders for the present. Prices on Southern brands have been marked up 25¢ per ton. Taking the week as a whole, it has been the most active period for perhaps two years. Quotations are as follows, for cash:

Lake Superior Charcoal.....	\$12.75 to \$13.00
Local Coke Foundry, No. 1.....	10.50 to 10.75
Local Coke Foundry, No. 2.....	10.25 to 10.50
Local Coke Foundry, No. 3.....	9.75 to 10.25
Local Scotch No. 1.....	10.50 to 11.00
Ohio Strong Softeners, No. 1.....	13.00 to 13.50
Southern Silvery, No. 1.....	12.00 to 12.25
Southern Silvery, No. 2.....	11.75 to 12.00
Southern Coke, No. 2.....	10.25 to 10.50
Southern Coke, No. 3.....	9.75 to 10.00
Southern, No. 1, Soft.....	10.25 to 10.50
Southern, No. 2, Soft.....	10.15 to 10.40
Alabama Car Wheel.....	17.50 to 18.00

In the Pittsburgh market sales of Bessemer Pig were considerably less than during the preceding week and prices are 25¢ a ton lower. Foundry Irons do not improve, either in demand or prices. Quotations are as follows for cash:

No. 1 Foundry.....	\$10.25 to \$10.50
No. 2 Foundry.....	9.75 to 10.00

Activity and strength have been the most conspicuous features of the market for Pig Iron in Cincinnati during the past week. At the close of last week Southern furnaces advanced prices 25¢ per ton along the line. The fact that an advance was contemplated had already stimulated the market, and when the rise came there was a further rush of orders both for long and short deliveries. The past week in some respects has been a most remarkable one, especially for the large tonnage sold in a short space of time, one of the largest local factors having booked orders for 30,000 tons in three days. The total sales for the week for the entire local trade will be not far under 50,000 tons. Foundries and mills, large and small, have been in the market urgently demanding attention, and at the close were orders were coming in rapidly, as a further advance

is anticipated by both buyers and sellers. The smaller buyers are purchasing for quick delivery and other contracts run from three to six months. The market for Scrap Iron too has hardened and higher prices are now asked with an advanced demand.

Quotations are given as follows:

Southern Coke, No. 1.....	\$9.75 to \$10.25
Southern Coke, No. 2.....	9.25 to 9.75
Southern Coke, No. 3.....	8.75 to 9.25
Southern Coke, No. 1 Soft.....	9.25 to 9.75
Southern Coke, No. 2 Soft.....	9.00 to 9.25
Ohio Soft Stone Coal, No. 1.....	14.50 to 15.00
Ohio Soft Stone Coal, No. 2.....	14.00 to 14.50
Lake Superior Coke, No. 1.....	11.75 to 12.25
Lake Superior Coke, No. 2.....	10.75 to 11.50
Hanging Rock Charcoal, No. 1.....	16.00 to 16.50
Hanging Rock Charcoal, No. 2.....	15.50 to 16.00
Tennessee Charcoal, No. 1.....	13.00 to 13.50
Tennessee Charcoal, No. 2.....	12.00 to 12.50

Metal Market.

Pig Tin.—Prices for Straits Tin have receded somewhat for prompt and current month delivery. Futures are still at a slight discount. Speculation has not been at all lively nor broad in character, yet sufficient to keep matters quite interesting at intervals. Deliveries to the out of town trade and to consumers have reached quite liberal proportions, and by all accounts the greater part of the 1900 tons that have arrived this month has been distributed. A good supply remains in first hands, but the holdings are scattered and there is consequently no pressure except in speculative circles. Retail prices for small lots of Straits from stock rule at about 15¢ @ 15½¢ per lb.

Copper.—The market generally remains quiet, but more on the influence of restricted offering than on business or demand. In any event no important dealings have taken place and inquiries have been only moderate, but no considerable amount of Copper is offered for delivery during the next 30 days, nor does there appear to be any pressure to sell further ahead. No change has been made in quotations for small parcels at retail, which remain on a basis of 10½¢ for Lake Ingot.

Sheet Copper.—Inquiry is fairly active, and the volume of small orders shows some improvement. Contracts for Cornice Copper on a large scale have not made much of a showing, however, during the week, although a good deal of this class of business is said to be in course of negotiation in this section. Prices are unchanged, small lots of Sheet Copper from store being quoted at the net list rate of 14¢ per lb.

Pig Lead.—A very fair business has been done in this market, and it is understood that considerable purchases have been made direct by large Western consumers. In some respects the position of the market is strong, but the buying interest seems still to dictate or regulate values to a great extent. Orders placed with jobbing houses in this district do not represent much beyond an ordinary routine demand. Prices for small lots of American Pig rule at 3½¢ @ 3¾¢ per lb.

Lead Pipe and Sheet.—While there is somewhat more life in the demand

for manufactured Lead, the aggregate volume of business still lags materially behind the average for this season of the year. Inquiry from the plumbers' supply trade is fairly brisk, but individual purchases are still comparatively small in their proportions. Prices in this section are maintained on the list basis of 5½¢ for Pipe and 6½¢ for sheet, subject to a discount of 60 %.

Spelter.—Little has been done here aside from ordinary dealings in carload lots. The demand, also, has continued to be of a routine type. Sellers are not forcing stock upon the market and values remain quite steady, small parcels of good Western brands from store ruling at 3½¢ @ 4¢ ½ lb.

Sheet Zinc.—Consumers are buying in a moderate way only, but jobbers' prices for small lots are rather stiffer, 4½¢ ½ lb being quoted for 600 lb casks and 5½¢ for smaller quantities.

Antimony.—Dealings have been only fair. In small lots Hallett's is quoted at about 8¢ and Cookson's at 9½¢ @ 9½¢ ½ lb.

Tin Plate.—Dealers report that wholesale spot business has not improved in any way during the past week, and dealings in futures have only been moderate, the demand all around being still uncommonly tame. On the other hand, the jobbers note that retail business of a small character has increased perceptibly, although the volume of orders still keeps disappointingly below the average for the season. The arrival of milder spring weather has somewhat stimulated the demand for Roofing Plates during the last few days, and this branch of the retail trade is likely to show marked improvement within the coming month. So far the season, as regards Tin Plates, seems to have run about a month behind in comparison with former years, but it is not unlikely that later orders may, to a considerable extent, make up for past deficiencies, as stocks in consumers' hands are far from liberal. Imports of foreign Plates have been rather free recently, yet stocks do not show any very considerable increase, and the assortment is still somewhat poor. American manufacturers are reported to be offering larger lines of Plates, both Brights and Ternes, at prices very slightly, if at all, above those quoted for the better grades of imported material. The prices quoted for both foreign and domestic Plates show very little change, but they are, if anything, rather weaker than those of a week ago.

A special London cable dispatch of April 24 to *The Iron Age* reports on the British Tin Plate market as follows: Tin Plate market has been languid. Prices are nominally unchanged, but stocks are being cleared up by some makers at very low rates. Ordinary Cokes were sold at 9/ in several cases, but where brands are specified makers demand an advance. Makers are using strenuous efforts to reduce cost, but workmen are determined to resist material reduction in wages and adhere to Board of Control limit of production. There are now 290 mills in operation, but few are fully employed. Quotations, l.o.b. Wales, are as follows:

Bessemer Cokes, IC 14 x 20 9/ @ 9/3
Siemens Cokes, IC 14 x 20 9/4 @ 9/6
Ternes, 20 x 24 18/ @ 22 6
Charcoals, IC 14 x 20 11/ @ 13/6

Sheet Iron.—Manufacturers' agents report a continued excellent demand for both Black and Galvanized Sheets. A number of mills are sold up on both

kinds of material as far as they can go; that is, for the next 60 days. At the meeting of Sheet manufacturers at Pittsburgh last week it was agreed not to sell during the next thirty days for delivery beyond July 1. Prices are firmer in both Black and Galvanized Iron, and there is renewed talk of an advance to be made shortly in the last named material. Small lots of No. 27 Common Iron in this section are quoted at 2.70¢ @ 2.75¢ ½ lb. Galvanized, under the same conditions, rules at 75 and 5 % to 75 and 10 % off, according to size of order and condition of delivery.

Chicago Report.

Scrap.—Old material is in much better demand, while the supply appears to be quite light. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap.....	\$6.50	
Machinery Cast.....	5.50	
Castable Cast.....	5.00	
Steel Plate (free of burr).....	4.00	
Burnt Iron and Grate Bars.....	3.00	
Sheet Iron and Hoops.....	2.00	
Flue Steel and Breaking Stock.....	4.00	
No. 2, such as Shovels, Hoes, &c.....	3.00	
Old Boilers—whole (iron).....	3.00	
(Iron)—cut in single Sheets and Rings.....	5.00	
Old Gas-Pipe and Boiler Tubes.....	5.00	
Cast Borings.....	3.00	
Turnings.....	4.00	
Horseshoes.....	7.50	
Copper Bottoms.....	6 ½	
Copper Clips and Heavy.....	7 ½	
Heavy Brass.....	6 ½	
Light Brass.....	3 ½	
Pipe Lead.....	2 ½	
Zinc.....	2 ½	
Rubbers.....	4 ½	

Anthracite.—The volume of business is small. Carload lots of 12 net tons or over are quoted as follows:

	Egg, Sto. Grate, and Ch.
Chicago, Ill.....	\$4.00 @ 4.75
Milwaukee, Wis.....	4.00 @ 4.75
Kansas City, Mo.....	7.80 @ 7.95

Cheyenne, Wyo.....	10.00
All points between Denver and Missouri River.....	8.85

THE OLD DOMINION OIL CAN COMPANY of Richmond, Va., have been incorporated, with Branch R. Allen as president; John Adams, vice-president; W. B. Saunders, secretary and treasurer, and R. W. Spillman, general manager. They will manufacture the New Departure Oil Can. The capital stock is \$10,000.

THE REYNOLDS WIRE COMPANY are now manufacturing Wire Cloth in their new factory at Dixon, Ill. The company's factory is 85 x 135 feet and four stories in height. It is operated by water power, the company owning one-seventh of the power produced by the Rock River. Large orders for Screen Wire Cloth have been received.

CONDITION OF THE

Hardware Trade.

A SLIGHT ADVANCE in the prices of some goods is one of the features of the market for the present week, and although the advances are not in themselves very important they are gratifying as perhaps indications of a reaction from the low and declining prices which have so long prevailed, and with the improvement in some respects in the general business situation and higher wages recently announced in some industries, are, it is hoped, significant of a better business condition. There is apparently a gradual increase in the volume of trade and the jobbing houses generally report a good and fairly satisfactory business. At the same time both they and their customers are still pursuing a policy of careful buying and are refusing to place orders for more goods than will be surely required in due course by their trade. There is, however, a disposition to purchase a little more freely and fractions of dozens are not called for quite so frequently. There is still some unevenness in the demand, one day having many and satisfactory orders, while the next is perhaps somewhat disappointing. Certain sections of the country are also in better condition than others, and not all lines of goods are equally in improved demand. This of course is to be expected, and such symptoms are normal in the process of recovery from the depression which has characterized trade.

Advice from Chicago.—The Shelf Hardware jobbers report no falling off in the volume of business, while the size of orders has increased materially over that of a month since. Salesmen are writing in very encouragingly of the outlook over all sections of the West. The demand for seasonable goods has grown rapidly of late. Manufacturers who were unable last winter to make the usual large advance sales for future shipment find themselves now called upon to fill orders in every direction. Stocks are so light that it is probable that before the season is over a considerable shortage will be felt in cases of this character. When everybody waits until he needs the goods, and then wants them quickly, somebody must certainly be left. Among the advances which have been made the past few days are 10 per cent. on Wood Planes, 10 per cent. on Agricultural Wrenches, and 20 per cent. on Leather Belting. Many other manufacturers are talking about advances and are instructing agents to hold prices firmly and make no concessions. Jobbers look upon these advances with much favor, as they will themselves be able to make a better profit. The low prices on staple goods continue, but they have not seemed to affect the general trade recently. The demand for Tin Plate is excellent and is expected to increase with the growth of business in the building trades.

Notes on Prices.

Wire Nails.—Without any important change in quotations the market is evidently in a somewhat better condition than a week ago. Some of the mills are withdrawing their extreme prices, and it is difficult to place orders at the lowest figures which have been ruling. The market is accordingly more regular than it has been, and is more accurately repre-

sented by the current quotations. Some of the manufacturers refer to the market as decidedly improved in its tone and are unwilling to accept orders for future delivery at the lowest quotations now ruling. The volume of business has been and continues large and some heavy orders have been placed. There is also a good deal of inquiry for relatively small lots. Quotations from store in New York are unchanged at \$1.10 to \$1.15.

Advices from Chicago.—The demand has been decidedly stimulated by the very low prices now ruling. Good sales have been made to jobbers at various Western points, one of these amounting to 10,000 kegs. All the manufacturers, however, are not willing to sell at the rates now ruling, and some are reported to have withdrawn quotations, while one very large concern has actually advanced its price 5 cents. The situation has not materially improved as to prices. Jobbers are doing a large trade at 90 cents, f.o.b. Joliet, for carload lots or less than carloads, but small lots out of store are firmly held at \$1.

Cut Nails.—There is little new in the Cut Nail market, but with the advance of the season there is an improved demand, and while trade is not specially heavy the mills refer to it as giving little cause for complaint. The fact that prices recently established are quite regularly maintained is a matter for congratulation, and it is anticipated that the demand will continue steady, with perhaps an increasing volume for the next month or two. Quotations for small lots on dock or from store in New York are 90 cents.

We are advised by the Laughlin Nail Company of Wheeling, W. Va., that the impression that they have abandoned the manufacture of Bessemer Steel Cut Nails is without foundation. They are ready to furnish their well known brand and have no intention of giving up this line of manufacture.

Advices from Chicago.—Manufacturers report a fair trade in lots of moderate size. Jobbers quote small lots from stock at \$1.

Barb Wire.—Manufacturers are doing a large business, making heavy shipments and receiving many orders. Notwithstanding this the tone of the market in the matter of price is not entirely satisfactory, and the irregularity referred to in our last review continues, with perhaps a slight tendency toward lower prices. The jobbers continue to sell at close prices and are meeting those made by the manufacturers, and in some cases underselling them. The market is fairly represented by the quotation of \$1.80 for carload lots of Four Point Galvanized, at mill, a figure which is sometimes shaded, while on relatively small orders some of the mills are disposed to ask a slightly higher figure.

Advices from Chicago.—Manufacturers are now in receipt of a large number of orders. The volume of business is daily much beyond the capacity of the mills, and if it continues at the present rate they will soon fall far behind on deliveries. Jobbers are having a large trade and are quoting small lots from stock at \$1.60 and \$1.95, respectively.

Bright Wire Goods.—The trade are familiar with the fact that for some time the Bright Wire Goods market has been demoralized and extremely low prices have prevailed. In order to correct this condition of things the manu-

facturers have recently been conferring, and, recognizing the necessity for an advance, announce higher prices. Withdrawing former quotations the goods are now quoted regularly at a discount of 90 and 10 per cent. All the manufacturers in this line of any prominence unite in announcing the new prices, and the market is regarded as in a much more satisfactory condition than for a long time. The fact that at former quotations the goods were selling below cost is referred to by the manufacturers as tending to secure the maintenance of the advanced prices.

Standard Fiber Ware.—The Standard Fiber Ware Company, Mankato, Minn., announce the following reduced prices on their line of Standard Fiber Ware:

	—Per dozen—		
	No. 1.	No. 5.	No. 5x
Water Pails, 12-quart.	\$3.00	\$3.50	\$4.00
Dairy Pails, 14 quart, \$3.30			
Fire Pails, No. 1, \$3.50			
No. 2, 14 quart, \$4.00			
Sugar Pails, with cover, 4.50	5.00		
Bugby Pails, short and light	2.75		
Prison Jars, with cover, 6.50			
Slop Jars, bal. trap, Nos. 5 and 5x	7.00	8.00	9.00
Chamber Pails, Slop Pails, Commode Pails, Nos. 5 and 5x, 14-quart.	6.50	6.50	7.50
Commode Rings, extra	1.50	1.75	2.00
Wash Basins, 10 1/2-inch	1.75	1.90	2.30
" " 13 1/2 "	1.90	2.20	2.80
Wash Howls	3.50	4.00	4.50
Pitchers	5.00	5.50	
Milk Pails, Old Gold, No. 5	2.00	2.50	
Fruit Bowls	1.80	2.10	
Keelers, 11 1/2-inch	2.50	3.00	
Waste Paper Baskets, 16-inch high	4.00	4.50	
Mats, 8 1/2-inch, for table use	1.00	1.50	1.40
Mats, 15-inch, for cuspidors, &c.	3.00	3.25	3.75
Mats, 17-inch, for slop jars, spittoons, &c.	3.50	3.80	4.30
Mats, 20-inch, for slop jars, spittoons, &c.	4.00	4.40	4.90
Cuspidors, 8 1/2 x 7 1/2 inch high	7.00	8.00	
Spittoons, Daisy, 8-inch, pressed	3.50	4.00	4.50
Spittoons, 10 and 11 1/2 inch	4.50	5.00	5.50
Peck Measures	3.00		
Half-Peck Measures	2.50		

The company refer to improvements they have recently made in their goods which render them very much superior to their former products both in durability and finish.

Grindstone Hanger.—O. H. Hanson, Litchfield, Minn., is putting on the market the Giant Grindstone Hanger, which, it is stated, will hang a stone true and fast to its shaft by means of set screws, no blocking, wedging or cementing being necessary. The Hanger is sold to the trade at \$8 per dozen.

Old Metals.—The demand is better, especially for Scrap Iron, but while prices are firmer they are not yet quotably higher. The tendency, however, seems to be toward higher figures in the near future. Dealers' purchasing prices for moderate sized lots, New York delivery, are approximately as follows:

Heavy Copper		\$b 7 c
Light and Tinned Copper		\$b 6 1/2 c
Heavy Brass		\$b 4 1/2 c
Light Brass		\$b 3 1/2 c
Lead		\$b 2 1/2 c
Tea Lead		\$b 2 1/2 c
Zinc		\$b 10 c
No. 1 Pewter		\$b 5 1/2 c
No. 2 Pewter		\$b 5 1/2 c
Wrought Scrap Iron, gross ton		\$7.50 @ \$8.00
Heavy Cast Scrap..... gross ton		7.50 @ 8.50
Stove Plate Scrap..... gross ton		5.00
Burnt Iron..... gross ton		3.00

Old Rubber.—The following quotations represent about the current prices paid by New York dealers:

Car Springs, ton lots, \$b.....	3 @ 3 1/2 c
Rubber Shoes, carloads, delivered at factory, \$b.....	4 1/2 @ 4 1/2 c
Rubber Shoes, less than carloads, \$b.....	@ 4 c
White Wringer Rolls, \$b.....	@ 3 1/2 c
White Syringes, \$b.....	@ 3 1/2 c

City Farming.

It was a happy idea which moved Mayor Pingree of Detroit last year to inaugurate the experiment of potato raising in that city, with the object of affording a measure of relief to the unemployed and worthy poor. Through his exertions a quantity of vacant and unimproved land within the city was loaned by the owners and prepared for cultivation. A committee was appointed, who were overwhelmed with applications for allotments, but were only able to accommodate 945 families. To each of these a plot of one-third to half an acre, according to the character of the ground, was awarded. Seed was provided and a superintendent was appointed to teach the city farmers to grow potatoes. Unfortunately the work of cultivation was begun rather late in the year and was followed by a severe drought, which caused considerable loss of the yield. Nevertheless the product of the plots, over and above that which was eaten as they went along, gave the cultivators some \$14,000; and the ground carried the whole 945 families through the summer and winter, so that they were not obliged to apply for poor relief. This result was rightly regarded as enough of a success for its adoption elsewhere, and we are glad to note that the plan is to be extensively copied in other large centers of population this year. The use of several hundred acres of vacant land within easy reach of New York and Brooklyn, as well as a number of spare lots in the last named city, have been secured by associations formed for the purpose. These are now being apportioned out to worthy poor people, who will undertake to work them, in plots of one-third of an acre. Some extensive figuring has been done in regard to the capabilities of the land, and it has been calculated that, with proper fertilization, each one-third of an acre ought to produce in the season not less

than 50 bushels of potatoes, 50 bushels of turnips and 500 head of cabbage. Moreover, as only about 12 whole days' work will be required, on an average, to produce this crop, the cultivators will have plenty of time to engage in other occupations as well for the support of their families. The scheme would be an excellent one in the eyes of humanitarians if its only effect was to take some of the tenement house dwellers for a while out of their squalid surroundings during the warm days and give them occupation in the fresh air. But it also provides pleasant and profitable employment by which the needy can earn at least a partial livelihood.

American Industrial Union.

Some details have lately appeared in the public press regarding a new departure in the field of labor organization which has been initiated in the West, and which in its principles and objects appears to embrace some commendable features. It is an organization which has just been started in Chicago under the style of the American Industrial Union, the general plan of which is somewhat on the lines of the American Railway Union. Its aims are briefly as follows: The establishment of employment bureaus, general co-operation and the introduction of a uniform eight-hour working day on September 1, 1897. In addition, it seeks to secure the adoption of the principle of arbitration in all differences between employers and employed and the entire elimination of strikes. The co-operative feature appears to be the point most strongly insisted on by the constitution. To this end the association proposes to ask for the establishment of postal savings banks for the benefit of wage earners; the accumulated funds of which should be used to establish industries which will absorb the unemployed and provide them at least sufficient work to enable them to be self-supporting. Instead of setting aside large sums of money for strike funds and the maintenance of highly salaried officers the available funds of the association are to be used for the furtherance of the co-operative idea, particularly in the direction of establishing and aiding co-operative colonies, of which a considerable number are already in existence. The organization is to be all-embracing, for every trade and profession, no discrimination of nationality, color, sex or religion being allowed. This bare outline of the objects of the new organization is sufficient to show that its aims are higher and less self-seeking than those of the average trade union.

Integrity.

The salary value of a man is measured by two virtues or characteristics—his ability and his integrity. While ability may be as varied in its extent and accomplishments as is the work which it seeks to achieve, integrity stands always the same, a virtue that may be possessed by any man, be he rich or poor, educated or without the simplest rudiments that go to make up what we call an education. And yet what do we mean by integrity? The word certainly appeals to us as being more comprehensive than mere honesty. It is at least interesting to note its derivation, which we find to be from the Latin word *integer*, meaning whole, and the signification still holds, for certainly the man of integrity is one who is whole in honesty. That is, his very being is honest; he is upright because it is—as he has made it—his nature to be upright. We can never think of a man possessing integrity merely for what he can get out of it, as we may consider one who is honest merely because it is the best policy and whom we may believe would be dishonest if it served his purpose better. One feels, however, that when integrity is attributed to a man that his interests are made those of his employer, because he is trying his level best to do as he would be done by and his intentions are honest as well as his deeds. Such a man, who can always be trusted, is the last one that an employer wishes to part with, for this virtue may even cover some failings in ability.

Untrustworthiness.

There is, however, a curious phase of what is sometimes called integrity that cannot justly bear the name. It is that wherein a man, sincerely honest in his motives, unintentionally tells untruths. He may be questioned as to whether his work is complete or whether things can be done so and so, and his answer, made without sufficient thought, may prove upon investigation to be incorrect. A continuance of this practice soon results in his being considered untrustworthy. One is never sure that a job left to such a man will be completed according to instructions. Not that the man intends to shirk or deceive, but that he is heedless, although intentionally honest. Appropriating anything that was not his own or losing in his employer's time might be the last thing he would think of doing, and yet he cannot be considered a man of integrity, for in other things his word is not to be taken implicitly. Such a failing is almost worse than mere lack of ability. At all events it prevents a man from ever occupying a position of responsibility, and is a retarding influence which should be overcome at all hazards. For it is not beyond the power of any man to break up such a habit—for such it is in fact—and cause himself to be trusted and honored by his employer.

THE LETTER BOX.

Battery for Electric Door Opener.

From D. C., Port Jefferson, N. Y.—I have an electric door opener which operated satisfactorily on three or four cell Leclanche or dry battery, but will not work on the crow foot or curved battery unless I use from 40 to 50 cells, and even then they must be in good condition. Will magnets of greater or less resistance give better service? The door opener is of the Sell & Starke make.

Answer.—The crow foot battery belongs to that class of batteries possessing great internal resistance, hence giving a weak current, but able to do this continuously for a long time. They are not adapted to the work for which our correspondent is using them. Increasing the external resistance would help matters in a measure, but would not make them work satisfactorily, as this type of battery is at its best only when working continuously. Consequently it can never be satisfactory for open circuit work. To obtain the best results the internal resistance of the battery should be no greater than the resistance of the circuit. We would advise our correspondent to use only batteries of the Leclanche type for his door opener.

Making Fire Pot Coils.

From M. A. Y., Newark, N. J.—To assist "E. G.," who makes an inquiry about how to make a coil for a fire pot in *The Metal Worker*, April 20, I will describe how I would proceed to make a coil. I presume that he has a good strong vise in his shop, and that he can get what assistance he requires to help him bend the pipe, when it is possible that he may be able to bend a 1-inch pipe cold into a 14 inch diameter coil. I would advise him to make wooden jaw pieces for his vise, one piece having a rounded surface and the other a flat surface. These should be made of hard wood. Then by gripping the iron in the vise the pipe can be bent for a short distance at a time until the coil is formed. As 1-inch pipe is rather large, and as considerable muscle is required to bend it, he may find that it is easier to heat the pipe and that a blacksmith's shop is better adapted to the work than his shop. If he goes to a blacksmith's shop he should draw a circle on a heavy piece of sheet iron which has been well chalked. The circle should be of the same diameter as he wants the outside of his coil to be. Then he can try the pipe as he proceeds with the work. He should heat the pipe a little beyond a red heat, and he should be careful to keep the side of the pipe up which has the seam in it, to prevent the seam bursting under the strain of bending. He can make the first bend at a point which will leave enough of the pipe for

cutting a long thread and to pass through the hole which he intends to drill in the fire pot of the stove. As he proceeds with his work he will learn the color at which the pipe bends most readily when heated. He will also find that it must be heated most where he desires to bend. In order to prevent the pipe bending too much in one place he will find an old tin can and a tub of water indispensable. After the proper bend has been given to one part of the pipe, by pouring cold water on this portion he will stop the bending and permit the pipe to be bent at another portion where it is hotter. After he has

carver or stone cutter who takes good care of his health is of good habits and has no lung trouble, and takes special care when working, be apt to live as long as the majority of men who work at other trades?

A Balky Furnace.

From T. D. G., Le Roy, N. Y.—In answer to the query of "J. H. W." in *The Metal Worker* of April 20, in reference to heating a house when west or northwest winds prevail, I would suggest that he change the location of his cold air duct, as shown in the plan

A Balky Furnace.

turned one circle he will find a large monkey wrench of considerable assistance in holding that part of the pipe which has already been bent, while bending the straight part. To make such a coil the assistance of a helper will be almost indispensable, and it is hardly probable that the first coil will be as true as he will desire. As he acquires some practice and experience, however, better workmanship will result. It is more than probable that he can buy a coil of the character he desires from some neighboring city cheaper than he can make one; but if he desires the experience and has the time to spare, the blacksmith's forge, the monkey wrench, the old tin can and the tub of water, he can, with a little assistance, complete the job.

Healthfulness of Stone Cutting.

From R. M. L.—I would like to learn through the columns of *The Metal Worker* whether stone cutting is a healthy occupation. Would a stone

herewith, so that it may run more direct from the northwest wall. By so doing he would not require an elbow. I would also suggest another cold air pipe from the hall, to be used when the wind blew from the west and northwest, when the regular cold air pipe should be closed or partly closed.

From G. H., Salem, Ohio.—I notice in *The Metal Worker* of April 20 that "J. H. W." is having trouble with his furnace. If he will place a 27 x 27 inch cold air register face in the floor of the hall close to the 10 x 15 heating register and run a cold air box of the full dimensions of the register face to the furnace he will relieve his trouble. The cold duct would have a capacity of 480 square inches and will enable cold air to circulate through the rooms. When taking the cold air from the hall the outside cold air duct should be temporarily closed. It will be noticed that the outside cold air duct has a capacity of about 240 square inches, which is entirely inadequate to supply the registers under any circumstances.

Is It Sanitary?

From B. C. H., Haywood, Cal.—I submit a sketch of a piece of work done in this town which is the occasion of some dispute. A claims that the job is not sanitary and that the trap will siphon itself, while B contends that the job is vented and sanitary. Our regulations require fixtures 5 feet or over from a vent stack to be back vented. I should like to have an opinion as to which is correct.

Note.—We trust our plumbing readers will express their views on this subject. If there was no fixture on the soil pipe but the fixture shown there would be little danger of siphonage. If there are other fixtures it is more than likely that the trap would be siphoned by a discharge of water through the main stack. This probability would be practically removed by

Is It Sanitary?

back venting the trap according to the regulations given. It would seem that the trap should be back vented to comply with them.

Will It Pay to Cover Furnace Pipe?

From A. Y. C., New Jersey—As the season has not yet opened for the furnace readers of *The Metal Worker* to be overwhelmed with work, I would like to hear opinions from different parts of the country as to the advisability of covering furnace pipe. We all know that when the tin pipes are left without any non conducting covering a very perceptible heat is noticed on opening the cellar door. The air which thus welcomes us has been heated by contact with the large surface of furnace pipe which is left exposed in the cellar. Some claim that this heat is not wasted, but keeps the floor warm, in accordance with the old proverb for health of keeping the feet warm and the head cool. Now, the question is, Will it pay to cover the pipes? The average furnace is liable to have at least six pipes, and their average length will not be far from 12½ feet, making 75 linear feet of pipe to be covered. The cost of covering this pipe will vary with the quality of the material which is used for the purpose, but in my section when furnace pipes are covered the price is not far from 50 cents per foot. This would make an expense of \$37.50 for covering the furnace pipes. There is no doubt but what some heat will be saved if the pipes are covered, but will enough heat be saved to permit a one-size smaller furnace to be used and a saving effected in the first cost of the furnace toward

paying for the pipe covering? If not, will it enable a furnace to be run easier and effect some saving in fuel, enough to save the interest on the cost of covering the pipe and a little to go into the sinking fund to pay for the original outlay for the pipe covering? If not, I would say that it would not pay to cover furnace pipe. I have covered pipes for some of my customers, but have not covered the pipes on the furnace in my own house. I shall be glad to hear from those who have had some experience in the matter.

Two Pumps on One Pipe.

From J. C., Boston, Mass.—In the answer to "W. K." in *The Metal Worker* of April 20 the remarks on the connection of two pumps on one suction pipe are pertinent and should be sufficient. Perhaps it would be well to observe that it is injudicious, to say the least, for plumbers to countenance or use doubtful devices. They ought not to introduce such work except under protest. I have never seen any automatic contrivance that would overcome the difficulties arising from connecting a second pump on one suction pipe, and more especially when the pumps are not level. It would be well for men repairing or fixing pumps to thoroughly understand all that a suction pipe must perform to secure perfect work with one pump. If they did, they would always see that the inconvenience and trouble of keeping two pumps on one pipe in working order would be greater than the cost of two suction pipes. When they do this they will secure the confidence of their patrons.

Placing Registers.

From YOUNG JAY.—I would like to see described in *The Metal Worker* the method used by its readers for determining the proper location for registers in a church to be heated by a furnace. Also, should the hot and cold air registers be placed side by side, or should the hot air be in the center and the cold air at the door? What is the latest approved plan? Make a diagram.

The Best Way to Calk Joints.

From J. C., Boston, Mass.—Seeing the inquiry of "Junior Plumber" in *The Metal Worker* of April 13, I give a few hints from my experience. The few suggestions I have to offer on making lead joints in soil pipes and other joints which will have to bear the water test are brief. First, never make two attempts at a joint if it can be avoided, and always have a ladle large enough to fill any joint that may have to be made at one pouring. Let the lead be hot enough to run the joint well, but do not let it get red hot. For all kinds of joints have well twisted coils of oakum and calk it properly into the joint, leaving no stray strands to make faults in the lead. Leave no less depth in the hub than 1½ inches for the lead. For a horizontal joint have an asbestos rope, or use putty or clay to keep the lead in the joint. When calking the horizontal joint do not cut off the pouring fin, but let the calking iron pass into and through it so as to fill any opening that may be caused by the shrinkage of the lead in cooling. When this is done the remainder may be cut off and the joints will be sound. In calking upright joints always begin tamping

furthest from the pouring place in order to fill any opening that may be there, and you may be reasonably sure to have joints that will stand the water test.

Joints in Greenhouse Piping.

From W. F. C., St. Louis, Mo.—In *The Metal Worker* of April 20 I notice the communication on making joints in cast iron pipe from "T. C." of Baton, and as I am convinced that all good things do not emanate from the Hub I venture to give my personal experience, even if it be from the Western wilds. "T. C." seems to advocate the use of iron borings and sal ammoniac. There is no question as to the firmness of this material, even after only a few hours' drying; but I find that the action of the sal ammoniac upon the pipe is very detrimental, as it continues the process of oxidizing for a sufficient length of time to gradually weaken the adjacent parts of the pipe. If "T. C." will try my mixture I think he will agree with me that time will be saved, as the consistency of the material, which resembles paste, enables it to be much more rapidly handled and the iron will be better preserved. He will find that it will require very little tamping, and in two or three days will become as solid as the sal ammoniac joint. Take rye flour and mix with the iron borings. Then add a little common vinegar and the paste is made.

Heating Country Schoolhouse.

In a recent issue of *Modern Progress* J. E. Patterson, writing on the subject of "Sanitary Heating and Ventilation," describes as follows a method of heating a country schoolhouse:

I am of the conviction that every country schoolhouse, no matter of what the superstructure may consist, should rest upon full foundation walls above a thoroughly drained cellar, and the chimney should extend down into this cellar, being provided with either a thoroughly protected fire place at the base or suitable opening for stove pipe. About on a level with the schoolroom floor, and opening into the chimney, a ventilating register should be placed. The heating stove may now be placed in any suitable or convenient place in the schoolroom and the pipe run to the chimney in the ordinary manner. Entering the floor, immediately below the stove, should be an opening connecting by suitable pipe with the outer air. Ignite now and keep alive, in either fire place or stove in the basement, a light, slow burning fire. This will induce chimney draft, tending to produce a vacuum in the chimney, and the cold air from the schoolroom will be drawn into the chimney through the ventilating register, the rapidity of its passage being increased when fire shall have been started and maintained in the schoolroom stove. The result of this will be a constantly changing atmosphere in the schoolroom, a circulation which will cause the intermixture of cold and heated air, producing an equable temperature.

In the article on the Trade School of the Springfield Industrial Institute, on page 51 of *The Metal Worker* of last week, it was stated in error that the day plumbing class would begin operations on December 2, 1894, and continue until April 1, 1895. The dates, of course, should have been 1895 and 1896, respectively.

TIN PLATES.

Women in Rolling Mills.

We have received the following letter from P. H. Laufman of Pittsburgh, Pa.:

Let me call your attention to the following article, clipped from a Pittsburgh paper, which the writer has been informed is correct in its details: "The employment of women as operatives in tin plate mills in America has proved a success in the large new plant of the Monongahela Tin Plate Company at South Fifteenth street. Two weeks ago Mrs. Hattie Williams of South Fourteenth street came to the manager of the Monongahela mill and asked for work because her husband was ill and could not support the family. Mrs. Williams was put to work separating plates as they came from the rolls, and so proficient was she that five young girls were given her as assistants and she was made forewoman of that department. It is said that the company now propose to put 100 girls and women at work in the mill within the next few weeks in several departments now run by men. Mrs. Williams said that she had worked in the tin plate mills of Wales for ten years before coming to this country. In the Swansea mills women form a great part of the operating force. A manager of the South Side mill said that women had proved very effective for the work. Mrs. Williams is being paid \$1.65 per day, while her husband, a laborer, is earning \$1 a day. To earn \$1.50 a day the women in the separating department must handle 6 tons of iron daily."

Among the things that are cursing our country at the present day is the adoption of foreign fashions and the customs of old, effete countries beyond the seas. It is seen in all grades of society and all branches of business. I will only allude to one, which is a disgrace to our republican idea, and particularly to the high esteem in which we hold woman. We in this country claim to have reached a higher plane of civilization in the elevation and culture of women. The point in this: The employment of women in our rolling mills, where the black sheets are made for tinning; women as openers of the packs after being sheared to size, with leather aprons and hand leathers on, working side by side with men and boys who are rollers, doublers, matchers and shearers, and who are generally of coarse feeling and vulgar in conversation. Shame! Shame!! And yet this is being done by some of our tin plate mills. There is one department of the manufacture of tin plates in which women might be employed, and yet I do not approve of that. In the finishing department of bright plate, women and girls could be employed and be kept separate from the men. I trust that our manufacturers will not contribute to bring our women down to the level of the poor oppressed women of Wales.

THE MACHINERY for the tin plate plant of the La Belle Iron Works, Wheeling, W. Va., has been received

and is now almost all placed in position. The works will be ready to start up within a short time. The rolling mill equipment includes four hot and four cold mills.

Champion Tin Scrap Baling Press.

The accompanying cut illustrates a baling press for tin scrap, now being manufactured by the Famous Mfg. Company, Randolph and Canal streets, Chicago, and which is recommended for use in stamping works and tinware factories. The machine is an adaptation of a hay baling press made by the concern. It is claimed to require but little power to run and only one person to operate it. The saving of time, labor and space that would be secured

even the union will have in the end to succumb to the inevitable and agree to a substantial cut in the wage scale, that appearing to be the only way out of the present difficulties under which the Welsh tin plate manufacturers are laboring. It has come to be a question between the institution of radical economies in manufacture or the entire closing down of their works. The only possible way in which production can be cheapened without lowering the standard of the product is by securing adequate reductions in the cost of labor. As it is the Welsh tin plate workers are being paid at a higher rate than almost any other workmen of their class in England. The tin plate wage scale was last fixed about 20 years ago, when the prices of plates were very considerably higher than they are at the present time.

Champion Tin Scrap Baling Press.

by the use of a machine of this kind in large tin working establishments, where scrap tin accumulates so fast and reaches such unwieldy proportions if left loose, will be appreciated by all who have experienced this inconvenience.

The Welsh Tin Plate Trade.

The situation in the Welsh tin plate trade continues to cause grave anxiety on the other side. Considerably more than one half of the workers are idle, and but very few of the mills still in operation are fully employed. The officials of the Tin Platers' Union continue to struggle against any further reduction in the wage scale. An important meeting of the men was to have been held at Swansea last week, when steps were, if possible, to be taken to bring about a uniform action among the work men employed at the various mills. At present the larger number of men who are employed are working at the reduction of 12½ per cent. in the wage scale, made at the opening of the year, and in several cases the men have agreed to a still greater reduction in preference to being thrown out of employment altogether. This action has, however, given great offense to the members of their union. Nevertheless, it is believed that

it therefore seems reasonable that the men should agree to bear their share of the present burden in this way. The English trade papers of every shade of opinion are strongly urging this upon the men as the most sensible course to pursue if they wish to keep their employment and enable their employers to hold any portion of the trade which is now drifting away from them. The manufacturers appear to have resigned themselves to the conviction that the American trade has substantially slipped out of their fingers and can never be regained in its entirety. They have, however, other fields to cultivate, and already they have succeeded to some extent in stimulating their trade with the Continent of Europe, as well as with Australia, South Africa and other portions of the British Empire, and they are now looking forward to a large demand from the Orient, following on the completion of peace between China and Japan.

FITZ, DANA & Co., 110 North street, Boston, Mass., issue convenient blotters backed with an advertising card carrying a calendar for the month of May and an announcement of metals, tin plates, roofing plates and other supplies handled by the firm.

SCRAP.

THE DUQUESNE TIN PLATE WORKS of Pittsburgh, Pa., are now in full operation at their new location on the South Side, adjoining the plant of the Monongahela Tin Plate Company. The black sheets rolled by the last named concern will be tinned in the works of the Duquesne Tin Plate Company, according to a mutual arrangement. The Monongahela Company will not dip at present.

THE TIN PLATE MILLS of the St. Louis Stamping Company, St. Louis, Mo., are running to full capacity with an average daily output of 800 boxes.

THE STICKNEY IRON COMPANY, Baltimore, Md., have begun the erection of a two-mill tin plate plant at Canton, a suburb of the city.

BRITISH EXPORTS of tin plate during the first quarter of the present year were of the value of \$5,268,744, as compared with \$4,834,777 in the corresponding quarter of 1894.

FURTHER ADDITIONS are to be made to the plant of the Ford & Dnnelly Foundry & Machine Company, Kokomo, Ind., in order to meet the increasing demand for tin plate machinery.

THE CONTRACT has been awarded for erecting the buildings for the Norton Tin Plate and Can Company's new plant, at Baltimore, Md.

THE SOMERTON TIN PLATE WORKS, Third avenue and Third street, Brooklyn, have been running continuously since last summer in order to meet an excellent demand for their bright charcoal and coke plates, which have acquired quite a reputation among consumers in this part of the country. A large part of their product is used at the adjoining tin box factory of Somers Brothers, the owners of the tin plate works. Just at the present moment the proprietors are considering the advisability of making some changes in their works in order to adapt them to the use of coal. Hitherto oil has been used for fuel, but the recent heavy advance in the price of that product has so materially increased the cost of its use that, as things now stand, a return to coal would seem to be the most economical course.

SIR JOHN JONES JENKINS, who is interested in some of the large Welsh tin plate works, speaking recently at a meeting of the Swansea Harbor Trust, declared his conviction that within a very short time the American works will be making nearly all the tin plate used in this country. The Welsh tin plate makers, however, he said, were gradually opening up other markets; and he thought that possibly the termination of the war between China and Japan would be followed by a very large outlet of Welsh tin plates in that direction.

TRADE REPORTS from England indicate that the demand for tin plates from Russia and South Australia is showing a steady increase. It is also anticipated that the settlement of peace between China and Japan will be followed by a considerable demand for tin plates from those countries, and the Welsh manufacturers are said to be making preparations to sedulously cultivate that market.

THE STATEMENT that the Foxhole Tin Plate Works, Llansamlet South Wales, was to be restarted after an idleness of two years, seems somewhat un-

accountable in face of the great depression in the Welsh tin plate trade and the fact that so many strong concerns have been obliged to close down their works. It seems to be a singularly unfavorable time for works that have not been operated for so long a period to be starting in again.

FURTHER DEPARTURES of Welsh tin plate workmen for the United States are reported by the English papers.

THE MACHINERY for the Laughlin Nail Company's new tin plate plant at Martin's Ferry, Ohio, has been shipped by the Totten & Hogg Iron & Steel Foundry Company of Pittsburgh. The same concern have recently shipped two mills to the Baltimore Iron, Steel & Tin Plate Company, Baltimore, Md.

JNO DRAEGE, secretary and treasurer of the Licking Rolling Mill Company, made Louisville the first place of offer to sell their new product of tin andterne plate. He exhibited fine samples ofterne plate and says his mill is now fully equipped for turning out any quantities for the market. This is the first mill south of the Ohio River to make tin plate. They roll their own black sheets.

THERE is some talk of building a tin plate plant at Scranton, Pa.

FOR A BALTIMORE tin plate concern an engine was built, complete, by the Maryland Steel Company of Sparrow's Point, Md., in 11 weeks, the designs, patterns, &c., being all made in that time.

GUMMEY, SPERING & Co., Philadelphia, are putting on the market a new high grade bright plate under the name of G. S. & Co. Tissue Brights. The firm report an excellent demand for their Alderleyterne plates and for their anti-pinhole bright plates.

MCLLVAIN, CRATER & HIGH, proprietors of the Reading Tin Plate Works, Reading, Pa., have completed the erection of their works and commenced making plates. They are conveniently located along the line of the Pennsylvania Railroad and will shortly have a siding run into their works. Their building is 30 x 100 feet, and they have installed therein two Phillips-Newbold stacks and will install another later in the season. They have room for six stacks altogether and their present installation will be added to as occasion requires until their equipment is complete. They have already placed seven brands ofterne plates on the market, as follows: America, an extra heavy redipped plate; Victor, a bright spangle plate with a trifle less coating than the America; Horton, a bright spangle plate, somewhat cheaper than Victor; L. C., a full weight plate, dark palm oil finish, of superior grade; Penn., a full weight plate, dark finish, cheaper than L. C.; C. H., a dark oil finish plate, 210 pounds to the box, and H. M., a plate weighing 204 pounds to the box. In a circular they are sending out to the trade the firm call attention to their different brands and state that all their plates are assorted, and that by the term "full weight" they mean 216 pounds. They also state that they make extra heavy coated ternes in either dark or bright finish and heavy spangled ternes, and that they can make a plate to carry anywhere from 10 to 40 pounds' coating and will make any plate called for according to specification provided.

THE VULCAN IRON COMPANY of New Castle, Pa., have recently closed a contract with the New Castle Steel & Tin

Plate Compny for ten sheet and ten pair furnaces, also 12 annealing furnaces for their new plant at New Castle, which will be the largest plant of its kind in the world when completed.

THE OFFICE of Charles S. Trench & Co., tin plate brokers, has been transferred from 20 Cliff street to 54 Cliff street, New York.

THE ALIQUIPPA TIN PLATE COMPANY of Pittsburgh, Pa., have been reorganized. The plant of the concern, located at Aliquippa, Pa., and which has been idle for a considerable time, is being overhauled and put in thorough repair, and is expected to resume operations about the 15th inst.

UNITED STATES CONSUL HOWELL, at Cardiff, Wales, has recently forwarded a report on the tin plate trade of his district to the State Department. According to this report the value of the total exports of tin plate from Great Britain to the United States during the calendar year 1894 amounted to \$13,348,930, which was \$2,742,997 less than the total for 1893 and \$1,431,992 less than the total for 1892. The consul remarks that the year 1894 was a wretched one on the whole for the Welsh tin plate trade. It also comments on the disappointment felt by the Welsh manufacturers on the absence of ill effect on the American tin plate works from the reduction of duty under the Wilson bill. Speaking of the effect of American competition on the demand for Welsh tin plates, the consul reports that, excepting plates for packing oil, practically the whole American demand is for lighter gauges, down to as low as 85 pounds per box of 112 sheets, 14 x 20, instead of the former standard of 108 pounds. This change, he says, is regarded as likely to be permanent. Probably the most serious feature of the year's trading, he adds, has been the seriously diminishing call forterne plates from the United States, the American works being equal to supplying almost the whole of that important trade. He also reports a marked falling off in all kinds of charcoal tins, but especially in the highly finished kinds.

Edward Foster, who carried on a large business as a tin and sheet metal worker at Ridge avenue and Spencer street, Philadelphia, and who was a well-known member of the sheet metal trade in that section, died suddenly, on April 29, from neuralgia of the heart. Mr. Foster was born in Lancashire, England, in 1842, and came to this country when he was four years old. He was apprenticed to Thomas Wilkinson of Philadelphia in early life, and learned the tinmith and sheet iron working business. In 1866 he began business for himself at the Falls of Schuylkill, and a few years built up a large trade and became an extensive owner of real estate. Mr. Foster was prominent in church and masonic circles. He was a manager of the Manayunk Trust Company of Philadelphia.

The combination of pottery manufacturers known under the name of the Akron-Canton Stone Ware Agency, which has sold more than two-thirds of the stone ware of the United States for the last ten years, has been broken up, owing to dissatisfaction among the 13 companies which formed the pool. The effect of this disruption, it is thought, will be to paralyze prices in the stone ware industry.

PLUMBING and GAS FITTING.

Call for the National Convention.

The following letter is being sent to the Master Plumbers' Associations over the signature of John Mitchell, president, and H. J. Pattison, secretary, of the National Association of Master Plumbers, from the president's headquarters in New York:

The thirteenth annual convention of the National Association of Master Plumbers will convene in the Walnut Street Theater, in the city of Philadelphia, Pa., at 10.30 a. m., Tuesday, June 11, 1895, continuing in session for three days. The Continental Hotel, Ninth and Chestnut streets, has been designated as national headquarters.

From the important events bearing upon our trade which have happened during the year and the very important questions to come before the members of the National Association this convention will undoubtedly be the most important one in our history. In order that the questions may be thoroughly discussed and wisely acted upon by the representative master plumbers, it is hoped that all local associations will send delegations of their best members.

Anticipating that the convention will be a large one, and in order to facilitate business in an orderly manner, tickets will be prepared bearing the delegate's name and signed by the national secretary, which will allow only delegates on the convention floor. Those attending the convention who are not delegates will have seats in another part of the convention hall. These tickets will be prepared, as far as possible, from the credentials returned to this office, so as to be ready for distribution immediately after the report of the Credential Committee. To avoid delay in the preparation and distribution of these tickets, please send to this office the names of your delegates who will attend the convention on the inclosed credential blank at the earliest opportunity.

It may not be out of place to call attention to Article XV of the constitution and Article XVI of the by-laws, which prescribe that all amendments to the constitution and by laws must be in the hands of the secretary, Henry J. Pattison, 258 West Eighteenth street, New York, at least 30 days before the annual meeting.

The following passenger associations have granted a reduction in railroad fare as described in next paragraph: The Trunk Line Association, the Southern States Passenger Association, N. Y. & Boston Lines Passenger Company, Boston Passenger Company and Central Traffic Association. It is expected that the Western Lines Passenger Association will make reductions, but in case it does not delegates west of Chicago, Peoria, Quincy, St. Louis and Cairo will have to buy regular tickets to these points and from there buy through tickets to Philadelphia and get certificate.

In order to secure a reduction in railroad fare carefully observe the following:

The reduction in railroad rates is

based on a fare and a third on the certificate plan. Any person availing himself of this reduction will have to buy a first class ticket from starting point to Philadelphia and secure a certificate from ticket agent from whom ticket is purchased. In buying ticket be sure and state that you are going to attend the master plumbers' convention so that the certificate will be made out to that effect. The certificate is a written statement that you have purchased ticket at regular rate and over a certain route. The certificate is indorsed at the convention by the national secretary and a special agent and is necessary to secure a return ticket at one-third regular rate. Ticket agents at all important stations in the territory of the associations granting rates will furnish certificates; but if your local agent cannot he will tell you the nearest station where one can be secured. In this event purchase ticket to such station and from there buy through ticket to Philadelphia and get certificate. Tickets and certificates can only be secured within three days, Sunday excepted, prior to and during the continuance of the convention, unless you are at a distant point and then provision is made for you. To accommodate all who desire to attend the steam fitters' convention the certificates will hold good for return ticket until the evening of June 18. Certificates and return tickets secured upon certificates are not transferable. The return ticket at one-third fare is for continuous passage over same route taken in going. Delegates should present themselves at the ticket office at least 30 minutes before the departure of trains, to give agent time to fill out certificates. No refund of fare will be made on account of failure to secure certificates and have them properly filled out.

Accommodations can be secured at the following hotels, none of which are more than five squares from the convention hall:

Continental, \$3 to \$4 per day; Girard, \$3 per day; Bingham, \$2.50 per day; Hanover, \$2.50 to \$3.50 per day; Windsor, \$3 per day; Vindig (for gentlemen only), \$2.50 per day; Brunswick, \$2 per day; Colonnade, \$3.50 per day; Lafayette, \$3 to \$5 per day; Bellevue, \$2 per day and upward; Metropole, \$3 per day; Stratford, \$4 to \$6 per day. The above are all on the American plan. The following are on the European plan: Lafayette, \$3 per day for room; Metropole, \$1.50 per day and upward for room; Dooner's, \$1, \$1.50 and \$2 per day for room.

Seamans' Water Heaters.

Two different apparatus for heating water, suitable for use in connection with the city water pressure, have been patented by Irving N. Seamans, 377 Maryland street, Buffalo, N. Y., who is now enlarging his facilities for manufacturing them. In Fig. 1 is shown his automatic heater, in which gas is used for the fuel. This apparatus can be adapted to the kitchen boiler already in use. It consists of a sheet metal jacket, lined with asbestos, which surrounds

the boiler, with a space between the jacket and the boiler. Under the boiler a specially constructed gas burner is set. The flow of gas to the burner is controlled by a thermostat, which is operated by the temperature of the water in the boiler. When water is drawn from the boiler and cold water takes its place the effect on the thermostat is to open the gas valve and start the burner in full operation. A by-pass is arranged in the burner so that a sufficient quantity of gas is supplied to keep a small flame burning continually. It is pointed out that the entire surface of the boiler is subjected to the effect of the burning flame and hot gases arising from it, so that the water is heated very quickly and with an economical consumption of gas. It is stated that the burner will consume as a maximum 40 feet of gas per hour, and that 1 gallon of water can be heated

Seamans' Water Heaters.—Fig. 1.—The Automatic Heater.

from a temperature of 45° to 180° by the combustion of 1 foot of gas.

Fig. 2 shows the instantaneous and automatic water heater, which will supply hot water immediately, or when connected with the boiler will perform the services of a water back. In construction it is a series of hollow copper disks with pins on the under surface, which are connected at the center by means of a brass nipple, so that 6½ feet of surface of high efficiency is exposed, or a total heating surface of 12 square feet. Beneath the heater a gas burner of four, five or six sections is placed, each section consuming as a maximum about 10 feet of gas per hour. The burners and the heater are enclosed in a sheet metal casing covered with a non-conducting magnesia jacket. The thermostat consists of a brass tube containing a composite rod of glass, which, through the inequalities of the expansion and contraction, opens and closes the gas supply valve. The valve is of the lever character of frictionless

construction to secure quick operation. The thermostat is placed in the center of the heater, where the different temperature of the water affects it most promptly; and it is said that it will operate the valve and turn on the gas when but $\frac{1}{2}$ pint of hot water has been drawn. It is stated that its construction is such that heat or cold will not injure its efficiency, and that it may be set to operate and hold the temperature of the water at any degree from lukewarm to the boiling point or even higher. It is claimed that this heater is adapted not only for connection with

Sanitas Pantry Sink.

The accompanying cut shows one of the many new fixtures to appear soon in the new catalogue of the Sanitas Mfg. Company, Boston, Mass. The idea is in accord with the prevailing sentiment in favor of open sanitary fittings, which is and always has been a feature of the fixtures of this company. Among the structural advantages of this pantry or kitchen sink it is pointed out that the trap is placed near the sink and the connection is made with a slip joint, rendering breakage practically impossible. The porcelain is roll rim and of such body that it is impervious to liquids and unaffected by chemical action or absorption. The drip boards at either end are made to any size and afford protection against breakage of ware by the user. The cocks are of extra heavy material, with a construction that, it is said, prevents spattering when the pressure is let on, and are

condemning penitentiary made cast iron and marble fixtures and pledging the members to discontinue their use.

The following officers were elected for the ensuing year:

President, T. B. Davis, Rock Island.

Vice-president, L. P. Hopkins, Springfield.

Secretary, J. P. O'Neill, Jr., Peoria.

Treasurer, John G. Roland, Chicago.

Delegates to Master Plumbers' convention in Philadelphia in June: T. B. Davis, Rock Island; J. M. Simpson and John O'Neill, Jr., Peoria.

The convention adjourned to meet next year at Rockford. A visit to Rock Island Arsenal was made in the afternoon.

In the evening the local association gave the delegates a banquet amid flowers and music.

After cigars had been lighted President T. B. Davis arose and called on Thomas Culliton of Chicago, who presented a watch charm, set with dia-

Fig. 2.—The Instantaneous and Automatic Heater.

the kitchen boiler for the storage of a supply of hot water, but it is also adapted for heating water in large tanks, for heating hot water stacks for indirect heating and for radiators and coils for direct heating. The heater is rated to furnish 600 gallons of hot water in ten hours when six burners are in use. When the heater is used for instantaneous work it will furnish a constant supply of hot water in quantity depending upon the temperature—the lower the temperature the greater the quantity. With a gas consumption of 40 feet per hour, and the water supply at a temperature of 48°, it is claimed that the device will heat 3 pints of water per minute to a temperature of 190°, 5 pints to 170°, and 7 pints to 150°. It is pointed out that this feature of the apparatus is adapted to the demand which grows with the use of gas or gasoline for cooking in the kitchen when there is no coal fire and water back to furnish a supply of hot water to the kitchen boiler. It is pointed out that the storage of a large quantity of hot water in a boiler in the kitchen adds appreciably to the temperature of the kitchen and to the discomfort of cooking in the summer.

A NOTICE is being sent out by P. Stanton, Broadway near McComb street, King's Bridge, New York, announcing that the firm of Stanton & Clark has been dissolved by mutual consent and that he will continue to carry on the plumbing, steam and gas fitting, tinning, furnace and range business in the building adjoining that formerly occupied by the firm.

Sanitas Pantry Sink.

supported at the wall with special posts. The legs and frame are so made that they are readily adjusted.

Illinois Plumbers.

The second annual convention of the Illinois Master Plumbers' Association was held at Rock Island last week, President John Simpson of Peoria in the chair. At the first session Mayor Medill cordially welcomed the visitors and President Simpson responded. About 100 members were in attendance. One of the matters under consideration was an amendment to the constitution increasing membership fees. The report of Secretary J. O'Neill of Peoria showed that about 95 per cent. of the master plumbers of the State are members of the association. Mr. Culliton of Chicago, who has been laboring with the Legislature for the passage of a bill for the regulation of the plumbing business in Illinois, made an encouraging report. In the afternoon the delegates visited points of interest. The most important resolution adopted was one

monds, to the retiring president, John M. Simpson. Mr. Boyd of Chicago presented a similar souvenir to John O'Neill, the secretary. Both these gentlemen responded briefly. W. E. Goddman, national treasurer, spoke, as did also the Iowa State president, Henry Ewinger of Burlington; B. M. Murphy, president of the Chicago local association; "Pap" Harris, ex-president of the Iowa State Association, who proposed the union of contiguous States into a district association; Paul Raditzky, Chicago, of the National Executive Committee, who emphasized the importance of legislation in order to secure a better class of work by responsible plumbers. Messrs. Burns and Bream of Chicago, John E. Allen, secretary of the Iowa State Association; J. W. Mills, State President of the Steam Fitters' Association; State President Loudon and a number of others were called upon.

THE SAN ANTONIO SEWER PIPE MFG. COMPANY, San Antonio, Texas, have been chartered, with a capital of

\$100,000. The incorporators are Geo. W. Russ and N. Mackey of San Antonio, L. A. Marshall of Indianapolis, and Aaron French and Carl Rutter of Philadelphia.

Plumbing Graduates of Pratt Institute Trade School.

The result of the examination, held by a committee of the Journeymen Plumbers' Association of Brooklyn, of graduates from the plumbing class of the trade school connected with the Pratt Institute, Brooklyn, on April 10 has just been announced. The following are the names of the successful graduates, who, after completing a 12 months' course of instruction, have been awarded certificates which, in case of the holder afterward applying for admission to the association, will be accepted in place of the examination otherwise required before membership is allowed:

S. M. Cavin,	J. P. Stuart,
J. W. Hurrall,	A. Daisley,
L. J. Noller,	L. W. Lvach,
R. Quanz,	W. W. Hull,
C. Swan,	S. Weinstock,
Jas. Stewart, Jr.	

Convention Gossip.

The National Association of Master Steam Fitters' Convention headquarters will be at the Continental Hotel in Philadelphia.

Visiting delegates to both the Plumbers' and Steam Fitters' conventions desiring accommodation at the headquarters of their respective associations would do well to remember that both conventions will be held in the one week and that the Continental Hotel is to be headquarters for each, and also for the Press Convention, in session at the same time; consequently early application for rooms should be made.

At a meeting of the Philadelphia Master Plumbers' Association recently held it transpired that no official notification of the fact that the convention would this year be held in Philadelphia had been received. The Philadelphia plumbers, however, are not wound up in "red tape" and are spreading themselves on arrangements for the entertainment of the guests to an extent which will assure a good time to all fortunate enough to be able to attend.

Some manufacturers of plumbing and heating goods have already secured parlors at headquarters and will be on hand at the right time to welcome their numerous acquaintances in the trade. Proprietor Kingley has made arrangements to place the writing room at the disposal of guests for exhibition purposes. This, with the privilege of exhibiting light articles in the rooms of guests, is about all the accommodation to be obtained for the exhibition of manufacturers' goods.

PLUMBER INSPECTOR KALBFELL of St. Louis has made his annual report, which is quite satisfactory, and it is probable that the office will be self supporting in future. The receipts were \$12,022 and the expenses of the office for the year have been reduced \$142.

Cast or Vitrified Pipe.

The plumbing ordinance of New Haven, Conn., is a bone of contention between the Board of Health and those who lay pipes into dwellings, and the board has selected W. J. Atwater as the man with whom they will fight out the question as to whether the ordinance concerning the laying of sewer pipes within 10 feet of and in the cellars of buildings calls for iron or vitrified pipe. This has been a moot question for a long time and a number of the plumbers have undertaken to have the Ordinance Committee make the ordinance so that vitrified pipe can be used as well as iron, but the committee has failed to agree and thus the ordinance remains a disputed point. It is claimed that the section which pertains to the point at issue is not clear and leaves the kind of pipe to be used optional with the plumber. It reads as follows:

"SECTION 6. Where it is necessary to lay soil pipe under the ground it shall be of a quality known as extra heavy pipe. The pipe passing through the walls of the building, and to a distance outwardly of at least ten (10) feet from the inside face of foundation walls shall also be extra heavy. All cast iron pipe must be sound and free from holes and other defects, of a uniform thickness, and of not less than the weights specified below for the corresponding diameters, and before use shall be thoroughly coated inside and out with coal tar or an equivalent substance."

TRAPS AND VENTS.

IN THE OFFICIAL CALL for the thirteenth annual convention of the National Association of Master Plumbers, sent out from New York City under date of April 27, it was erroneously stated that the convention would be held in the Chestnut Street Opera House. By a later arrangement the convention will meet at the Walnut Street Theater, which is within 200 feet of the Continental Hotel.

WATSON & TOSSELL, Finn & Fischer, Sullivan Plumbing & Heating Company and John Young, Bay City, Mich., have written a joint letter to the local papers in answer to some allegations made by a member of the school board in reference to the bids for plumbing in a new school. They point out that the specifications were very faulty and called for some equally faulty sanitary apparatus and that in their bids they ignored these defects and bid on a properly arranged system with proper fixtures.

THE EXAMINING BOARD of Plumbers of New York City is composed of Col. George D. Scott, formerly of the Eighth Regiment; Horace Loomis, Engineer of Sewers; James O'Brien, Jr., E. McGovern and Michael Ryan. The last three members are plumbers.

THE GORRY FOUNDRY of Willimantic, Conn., has been purchased by the Vanderman Plumbing & Heating Company for \$7000. The plant will be used by the company in their business of manufacturing plumbers' specialties and heating apparatus.

SCHOELKOFF & EISENBISE, plumbers, are erecting a business place on Schuykill avenue, beyond Hockley's, Reading, Pa.

THE PROCTOR HEATING COMPANY have been incorporated at Chicago, with a capital stock of \$10,000, to do a general plumbing business; the incorpor-

ators are Thomas Y. Fitzgerald, Alfred D. Proctor and Hart J. Fitzgerald.

AN IMPORTANT EXHIBITION of plumbing and sanitary goods is to be held this month in Paris, France, under the auspices of all the departments of the state concerned in sanitation. Leading sanitarians and plumbers of France are said to be taking a lively interest in securing the success of the exposition. English manufacturers in this line will, it is believed, make a good showing, but it is feared that American houses will not be very numerously represented.

BARLOW BROS., Waterbury, Conn., have bought a lot 75 x 70 feet for the extension of their plumbing, heating and tinning business.

THE APPLICATION of the Master Plumbers' Association of Toronto, Canada, to the City Council for certain specified amendments to the plumbing by-laws of the city is attracting a great deal of attention, not only from the local trade, but also from plumbers at other points all over the Dominion. Among the amendments are one for a reduction in the plumber's license fee from \$10 to \$1; for a specified weight for soil pipe at 12 to 13 pounds, and the abolishment of the front wall trap and fresh air inlet, letting the house drainage system ventilate the sewer.

SOIL PIPE from the United States has invaded Canada to an extent that has interfered with the production in that country.

AFTER AN IDLENESS of more than a year the factories of the Akron Sewer Pipe Company, Akron, Ohio, are again in full operation.

CHARLES J. & F. E. TAYLOR have moved their plumbing establishment from its former location on South Allegheny street to the basement of the Orider Building, Bellefonte, Pa.

WILLIAM THUMBRE, plumber, gas and steam fitter, Easton, Pa., has opened a shop in the basement, 245 Northampton street.

A GENTLEMAN who has recently returned from England regales a Boston reporter with these bits of gossip: "There was an Englishman who prided himself upon his ability as an amateur plumber. He decided to put gas connections into his house and do it himself. He went to work with a great flourish; hammered and soldered and fitted away, and at last came the hour of final triumph. He called the family into the parlor beneath the great chandelier. He turned the taps, with taper in hand—and vigorous showers of water gushed forth over them all. He had made the mistake of connecting with the water pipe instead of the gas pipe."

COLWELL LEAD COMPANY, New York, are showing in their Centre street windows a mammoth Barry drum trap, made by the Barry Mfg. Company, Muscatine, Ia. This trap is for use in connection with kitchen sinks, to prevent grease getting into the drainage system and stopping the piping.

THE FOLLOWING plumbing establishments have recently been started in Chicago: William S. Kneisly, 18 Twenty sixth street; Henderson & Thoiné, 23 North Ashland avenue; J. J. Curlin, 4939 South Ashland avenue; William Ingram, 1242 East Ravenswood Park; Powers & Schirmer, 1909 West Madison street; Charles J. Freehauf, 316 West Chicago avenue.

THOMAS KELLY & BROS. have removed from 124 Franklin street to 201 East Madison street, Chicago. They have secured much larger space than before, now having a room on the ground floor 30 x 180 feet, with a basement of equal size. They will use the ground floor as an office and show-room, and the basement for machinery and brass foundry. They will have vastly improved facilities for making and handling their specialties in closets, &c.

The five master plumbers of Sterling, Ill., have commenced the formation of a Master Plumbers' Association, to be a branch of the National Association. The details are not yet fully completed, but Louis G. Spica is president and Wm. F. Lawrie secretary.

JOHNSTON & MEYER, St. Louis, Mo., have been awarded the contract for plumbing, gas fitting and sewerage of six stores and flats erected in that city at Broadway and Allen street. This concern report an excellent demand for their National combination sink and trap which they recently placed on the market.

THE PLUMBING FIRM of Haslet & Weber, Mechanicsburg, Pa., has been dissolved and Mr. Haslet will continue the business at the old stand.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

PARK BROS., 79 Dearborn street, Chicago, have the contract for the plumbing and drainage in the residence of D. M. Hayes, 2223 Jackson boulevard.

D. F. DEWAR & Co. 335 Sixty third street, Chicago, are to do the plumbing and drainage in the apartment building of E. P. Shandberg, Dickey and Sixty-fifth streets.

KENNEDY & O'CONNOR, 243 Ninety-second street, Chicago, have the contract for the plumbing and drainage in the flat building of A. F. Hagman, 8700 Buffalo avenue.

THOMAS E. ROBINSON, 2715 South Halsted street, Chicago, is to do the plumbing and drainage in the flat building of Frederick Schick, 46 Twenty-fourth street.

J. REILLY JR., Bridgeport, Conn., has just received the contract for the plumbing of the new schoolhouse of the church of the Sacred Heart, on Park avenue.

ROCHE & MCGUIRE, New London, Conn., are plumbing Mrs. Scowbee's handsome new residence at Fisher's Island.

A NEW GYMNASIUM is to be built for the Bangor (Me.) Theological Seminary. The building will be of brick, 42 x 80 feet, and will cost \$10,000.

J. F. BRADY, Bridgeport, Conn., has the contract for the plumbing in a new house for K. Klein.

THE MCCORMACK HEATING COMPANY of Wallingford have just completed the setting and piping of two of their boilers in the Hotel Majestic, on Chapel street, New Haven. The building is provided with 123 direct radiators, while the 46 bathrooms are heated by 2-inch stand pipes.

THE PLUMBING CONTRACT for the new Lynnfield hotel has been awarded to Frank A. Wendell, Salem, Mass.

THE FOSKETT & BISHOP COMPANY, New Haven, Conn., have the heating and plumbing contract for the new residence of Geo. B. Woolson.

S. E. DIBBLE, New Haven, Conn., has the contract for the heating and plumbing of the new St. John's Church on George street, and also for the St. Elmo Club House on Grove street.

SEALED PROPOSALS will be received at the Bureau of Medicine and Surgery, at Washington, D. C., until 1 o'clock p.m. on Saturday the 25th day of May, 1895, for repairing and renovating, plumbing, heating, &c., the Naval Hospital at Brooklyn, N. Y., in accordance with plans and specifications which can be seen upon application to the Bureau of Medicine and Surgery, Navy Department, or the Superintendent of Repairs at the U. S. Naval Hospital, Brooklyn, N. Y.

THE "BLINGTON ARCADE," to be built at Stamford, Conn., in the two upper stories will have two apartments on each floor, consisting of parlor, library, dining room, kitchen, two chambers and bathroom, with fire places, gas logs, tiled hearth, and bath room floors, open plumbing, &c. The heating is to be done by Richardson & Boynton's hot air furnaces, gas logs and open fire places.

THE BUILDING COMMITTEE of the Board of Supervisors of Oswego, N. Y., awarded a contract for supplying a heating apparatus for the new County Clerk's office to the Fitzgibbons Boiler Company for \$1453. John C. Sullivan placed the bid for the Fitzgibbons Company and will do the plumbing work and steam fitting in connection with the contract.

THE COUNTY COMMISSIONERS at Fitchburg, Mass., ordered that the Court House be entirely replumbed. Brownell & Mason will do the work under the supervision of H. M. Francis.

THE CONTRACT for heating and ventilating the Nonstuck school building, at Holyoke, Mass., was awarded to the Fuller & Warren Company, whose bid was \$4900, with an allowance of \$250 for old machinery. The contract for the Hamilton street school building went to Kennedy & Sullivan for \$2425.

BABB, WITHAM & KELLEY, Bangor, Maine, are putting a hot water heating system into the residence of Charles Woodman, Broadway.

THE PUBLIC PROPERTY COMMITTEE of Gloucester, Mass., held a meeting last week and voted to accept plans for the heating and ventilation of the Magnolia schoolhouse.

JASON KIDDER, Franklin, N. H., has the contract to remodel the heating arrangements at Hon. Charles E. Tilton's residence.

THE COURT HOUSE of Nodaway County, Mo., is to have a new heating plant, but as yet the system has not been selected.

BIDS will be received at the office of the City Clerk of Racine, Wis., until May 18, for a heating and ventilating system for the addition to the Seventh Ward School Building.

THE CONTRACT for heating the new jail at Blue Earth City, Minn., has been awarded to the Windsor Heating Company.

THE HOPSON & CHAPIN MFG. COMPANY of New London, Conn., have the contract for supplying the heating ap-

paratus for the new Christ Church at Ansonia. James Keating of New London is in charge of the work. The system will be hot water.

BROWNELL & MASON, Fitchburg, Mass., are remodeling the plumbing in the Court House.

J. C. HICKEY & Co., 551 Ashland avenue, Chicago, have the contract for the plumbing and drainage in the flat building of J. M. Gallagher, 12 Hastings street.

H. BREYER, JR., 1725 Milwaukee avenue, Chicago, is to do the plumbing and drainage in the flat buildings of M. M. Kimbell, 1421 to 1423 Kimbell avenue.

WILLIAM BOWDEN, 238 Twenty-fifth street, Chicago, is to do the plumbing and drainage in the flat building of D. A. Roche, 2639 Armour avenue.

JOHN MCCOURT & Co., 3450 Indiana avenue, Chicago, have the contract for the plumbing and drainage in the flat building of H. Hagman, 3759 Thirty-seventh street.

THE J. F. ALLES PLUMBING COMPANY, 233 Lincoln avenue, Chicago, are to do the plumbing and drainage in the flat building of E. Gehrke, 61 Bissell street.

STEINER & REID, 918 West Twenty-first street, Chicago, have the contract for the plumbing and drainage in the flat building of Herman Janske, 829 same street.

J. STEWART, 6506 Wertworth avenue, Chicago, has the contract for plumbing and drainage in the residence of E. S. Paillips, 6611 Carpenter street.

RICHARD TAIT, 605 Sixty-ninth street, Chicago, is to do the plumbing and drainage in the residence of H. Brake, 7028 Farnell avenue.

F. A. FISHER, 5329 Lake avenue, Chicago, has the contract for the plumbing and drainage in the flat building of J. Schen, 17 Bingham street.

FRANK MEEK, 455 West Eighteenth street, Chicago, is to do the plumbing and drainage in the residence of James Connell, 92 Mohawk street.

CHARLES C. BREYER, 187 West Division street, Chicago, has the contract for the plumbing and drainage in the flat building of Julius Casper, 350 N. 19th Robey street.

P. EICHENBAUM, 815 Armitage avenue, Chicago, has the contract for the plumbing and drainage in the flat building of R. F. Coles, 1039 Braist avenue.

The United Asbestos Company of Dock House, Billiter street, London, England, have recently introduced a new and specially efficient form of covering for steam pipes, consisting of blocks of asbestos secured by strips to a backing of asbestos cloth. Owing to the method of construction this covering can, it is said, be wrapped around the pipe about as easily as if it were a single layer of cloth. The blocks of asbestos, however, bring the thickness of the insulating material up to about 1 inch. The material is made in long strips and is intended to be wrapped around the pipe spirally.

The Board of City Affairs of Dayton, Ohio, have decided to make considerable extensions in the sanitary sewer system of the city.

STEAM AND HOT WATER.

A Hot Water Heating and Ventilating System.

The St. George's Episcopal Church, Flushing, N. Y., is one of the landmarks of Long Island. The original church, now used as a chapel, was built on the site of the present church about 100 years ago. It is a frame building shingled on the outside. About 40 years ago it was found necessary to increase the size of the church. The old building was moved to a new foundation on the side street and a stone church erected in its place; since which time the old building has been used as

1, the church being 60 x 120 feet, with a varying height of ceiling averaging about 22 feet, and contains 160,635 cubic feet of air space, and the chapel, which is about 20 feet distant, is 40 x 30 feet, with 20 feet height of ceiling in the main schoolroom, and contains 55,830 cubic feet of air space. The church has a seating capacity of 850 to 900, and, as it is only occupied for one and a half hours twice a week, it was decided to provide for natural ventilation, with indirect radiation to furnish sufficient warm air to change the air in the auditorium once per hour. The hot water heating system, with direct and indirect radiation, was decided on, and 1000 square feet of extra wide Perfection pin indirect radiation was placed in four stacks in a brick casing, as shown in Fig. 2. A cold air supply, 20 x 36 inches, was taken from outside the building on the north side. Cold air was also taken from two points inside the church, and dampers arranged

The chapel building and each section of the mains in the church building were controlled by valves. The expansion tank was placed on the second floor of the chapel and circulated from the nearest flow main, and a separate expansion pipe was carried back to the heaters inside of valves. The mains run about 150 feet each way from the heaters, running side by side and rising 1 inch in 10 feet. The mains underground to the chapel are placed in a box of 2 inch hemlock, tarred on the outside and with a drain below it to carry off the surface water; the ends of the box being carried from inside of wall to inside of wall and the pipe covered with asbestos paper, hair felt and canvas, with an air space. The 3-inch main supplying the indirect stacks drops from the point where it leaves the main, so that no air valves were required on the stacks. Each direct radiator was fitted with a Mackay quick opening valve, a union elbow and a keyed lock

A Hot Water Heating and Ventilating System.—Fig. 1.—Showing Plan of the Church and Chapel.

a chapel and Sunday school. The chapel has always been heated by stoves or room heaters, while the church was heated by three large brick set hot air furnaces, with no means of ventilation, except such as could be obtained by opening the windows.

In the spring of 1894 it was decided to enlarge the building, renovate it throughout, add modern improvements and a system of heating and ventilation. The work was placed in charge of J. King James, architect, 126 Liberty street, New York. The heating and ventilating system was designed by W. M. Mackay, heating engineer, 211 Water street, New York, who has planned the heating and ventilating of several hundred church buildings during the past 25 years; the system was installed by J. D. & C. C. Lincoln, heating contractors, 236 Water street, New York. The plant was completed in October, 1894, and has been in constant operation since that time, and has proved efficient during the past winter. A plan of the buildings is shown in Fig.

so that all the air could be taken from either point or part from both, as desired or found necessary, as shown in section in Fig. 2. Warm air was delivered at three points in the church auditorium through 22 inch round galvanized warm air pipes, with 20 x 24 inch registers.

The intention was to heat the auditorium to 65° F. and all other parts of both buildings to 70° F. in the coldest weather. Fourteen hundred and ten square feet of New Standard direct radiation was placed in the church building, arranged in 16 radiators, as shown on plans, and 1097½ square feet of New Standard direct radiation was placed in the chapel building in 15 radiators. Two No. 25 Royal water heaters, manufactured by Hart & Crouse, Utica, N. Y., each having a rated capacity of 2300 square feet of direct radiation, were placed as shown. It was found necessary to carry the mains as shown on plans, as the basement of the church was not excavated, except at the points where the old furnaces were located.

shield air valve. The mains in the basement were covered with Manville lamb's wool covering.

For ventilation a flue 3 x 3 feet with a 12 inch round tile smoke flue in center was carried up at the rear of the new part of the building. The smoke pipe from the heaters was connected to the flue, and also an arrangement made at the base of flue so that a fire could be maintained during the summer months when necessary. Ventilating registers were placed at two points in the church and connected to the vent flue by galvanized ventilating pipes.

The apparatus, we understand, has done all that was claimed for it in an economical manner, consuming less coal than was formerly used in the furnaces for heating the church alone, while furnishing ample heat at all times for all parts of the building. The ventilating system has worked perfectly and proved ample for the requirements. The cost of the heating and ventilating apparatus, not including the vent flue or smoke stack, was \$3500.

HEATING NOTES.

J. H. COLEMAN, Jr., manager of the Boston office of the J. H. McLain Company, Canton, Ohio, visited *The Metal Worker* office this week. Mr. Coleman has his headquarters at 51 Oliver street and is prepared to give full particulars in reference to the line of Humber, Cambridge and Yale steam and hot water heaters, and is showing the new Cornell for steam and Princeton hot water apparatus of the vertical section type.

FIVE BROS., Reading, Mass., have recently bought the heating business formerly carried on by H. K. Austin.

HAYES & FALLS, 290 State street, Rochester, N. Y., are sending to the trade catalogues descriptive of the Torrent steel water tubs boiler which they manufacture. The catalogue is of oblong shape and contains a general view of the boiler with the brick work broken away, showing the tubular ar-

others with lantern roof. Cuts are shown of rafters, purlins, ridge and side brackets, fittings for bench frames, crestings, and all of the various material required for the construction of a greenhouse. These are followed by 40 pages of half tone engravings, showing palm and rose houses and commercial greenhouses, some of which are very handsome in appearance. One of the illustrations shows the curvilinear palm house which they had on exhibition at the World's Fair, and which is now erected on the grounds of James Weir, Jr., & Son, at the eastern entrance of Greenwood Cemetery, Brooklyn. A number of handsome conservatories are shown erected in connection with residences. All of the houses are heated with the Hitchings hot water boilers.

THE AMERICAN RADIATOR COMPANY, 111-113 Lake street, Chicago, and 92 Centre street, New York, have just issued a superb volume enti-

constructed with extended surface and supporting a radiator section in which the feed chute is placed and which supports the smoke radiator, which is of novel construction, presenting a large heating surface and effecting indirect draft. From the top of the "clinker punch" are two arms running into the combustion chamber carrying fresh air into the furnace at a point where it is said to mingle with the gases and improve the combustion. An Oxford regulator is furnished with each furnace for controlling the fire. The last pages in the book are devoted to tables giving dimensions and ratings of the capacity of the furnace.

LOCKWOOD & ADAMS have moved to 143 Centre street, New York, where they are arranging their sample room to make a display of steam and hot water radiation.

WALTER PENDLETON, manager of the New York office of the Niagara

Fig. 2.—Showing Location of Boilers, Mains and Radiation.

range and the position of the fire. A sectional view is also presented, illustrating the course of the products of combustion and of the circulation of the water. With these illustrations are full descriptive particulars, and there are likewise presented some particulars of an evaporating test made with the Torrent boiler, which showed a result of 1½ pounds of water evaporated to a pound of coal. A table gives full particulars of sizes, capacities and prices, and at the close are testimonial letters from a number of people who have used the boiler with the most satisfactory results. Reference is likewise made to horizontal steel tubular boilers which they manufacture. All those interested in the heating question are asked to send for a copy of the publication.

THE NEW CATALOGUE issued by Hitchings & Co., 233 Mercer street, New York, devoted to modern greenhouse construction, is a handsome piece of trade literature. The first few pages call attention to several of their trade specialties for the erection of even span and three quarter span greenhouses, with non-freezable gutters and patent sash opening apparatus. Some are shown with curvilinear rafters and

titled "American Architecture." It contains a large number of fine engravings illustrating buildings in the territory covered by their New York office which are heated with American radiators. The engravings are photographic reproductions, printed on heavy plate paper, and in themselves are valuable as showing the modern type of architecture displayed in office buildings, hotels and other large structures. The names of architects and heating contractors are given in connection with each building. A list is also given of other buildings of note in the same territory which are heated by American radiators. The book is well worthy of preservation, being so handsomely gotten up that it is really a souvenir.

THE J. H. McLAIN COMPANY, Canton, Ohio, are issuing a 16 page pamphlet in a deep orange cover with an embossed gilded title devoted to their Oxford perfect blast furnace. The text is printed on fine paper in two colors of ink, a dark green and a rich brown. The half-tone engravings show the furnace finished complete and in various stages of completion. The furnace has a large ash pit, in which is suspended a center slide grate. Above this is the fire pot,

Radiator Company of Buffalo, N. Y., has just received another carload of Niagara radiators at the New York warehouse, at 56 Franklin street.

THOS. P. CUBRINO, well known to the customers of the John Simmons Company, New York, is now in the city for a few days preparing for another trip among the steam fitters and plumbers.

E. P. FOSTER of the Electric Heat Regulator Company of Minneapolis, Minn., has opened an office at 89 Centre street, New York, where he has their heat regulating governor placed so that its operation can readily be seen by steam and hot water fitters, who are invited to call and inspect it.

JOSEPH BOND, president of the American Radiator Company, was a guest at the New York office this week, having just returned from his trip to Europe. During his absence he established an agency for the line of American radiators in London, England.

THOMAS W. WEATHERED'S SONS are displaying three of their hot water apparatus in front of their headquarters at 141 Centre street, New York. The display is rather striking, as one of their

smallest boilers is placed alongside of one of their largest boilers, showing a vast difference in size.

TREASURER W. H. Pfahler of the **Abram Cox Stove Company**, Philadelphia, was a visitor among the heating trade in New York this week.

F. H. PATRICK, one of the traveling salesmen of **Smith & Winchester**, Boston, dealers in everything for gas, water and oil, was a visitor among the heating trade of New York, stopping at the New York office, this week.

JOHN A. SCOLLAY, 74-76 Myrtle avenue, Brooklyn, and 89 Centre street, New York, is issuing a pamphlet in the interest of the invincible vertical section drop tube hot water boiler. One of its statements is, "The invincible is the natural development of two generations of experience of our house in the hot water business." The pamphlet describes the construction and points out the features claimed for it in detail, 12 claims being made. The last two pages are devoted to giving the price-list and ratings of the boilers for residences and for greenhouse heating.

THE NEW YORK HEADQUARTERS of **Smith & Winchester** of Boston have been transferred to more commodious and handsomely fitted quarters at 141 Centre street, New York. Secretary **N. E. Frost** presides over the steam and hot water department in the interests of the Winchester boiler. Preparations for a line of samples consist of a platform extending around the room, covered with a red velvet carpet. Mr. Frost's desk is inclosed behind a polished brass railing. A handsome chenille curtain, suspended from an ornamental pole, drapes the doorway to the pump and windmill show room, which is presided over by Mr. Carter. A conspicuous feature of this room is an 8 foot galvanized iron S. & W. windmill. Arranged beside it are several kinds of pumps and samples of a variety of their goods for artesian and driven wells. At the entrance to their office, by the door, is a Winchester boiler, and above it is a handsome sign in gilt and black giving the address of the firm and the specialties dealt in by the house. **J. W. Fryer** will travel for the house in the interest of the Winchester steam and hot water goods.

J. J. WILSON has resigned his position as salesman and heating engineer with the **Fuller & Warren Company**, Troy, N. Y., and is now at his home 1613 E. Chase street, Baltimore, Md.

AS A RESULT of the work of State Vice-President of Illinois **John W. Mills** of Chicago, a State association of Master Steam Fitters, with a membership of 60, was formed during the plumbers' convention at Rock Island, Ill., last week. The officers are: President, **T. B. Davis** of Rock Island; vice-president, **L. P. Hopkins**, Springfield; secretary, **John O'Neill, Jr.**, Peoria; treasurer, **John G. Roland**, Chicago. These officers and Mr. Mills are the Executive Committee of the association.

ALEXANDER DON, manager of the New York office of the **W. H. Page Boiler Company** of Norwich, Conn., has his show window at 61 Gold street occupied by a No. 15 All Right and No. 1 Volunteer hot water boiler and a No. 2 Volunteer steam boiler. Outside of his showroom is used for displaying the All Right and Volunteer boilers, steam and hot water heating apparatus being placed alternately from the smallest size to the largest size, which is the

Volunteer steam boiler, rated to carry 1500 feet of radiation. A space is reserved at the center of the same room for displaying a Page safety sectional boiler, and the interests of the line of boilers will be looked after in Pennsylvania by **J. A. Donnelly**, formerly with the **Smith and Anthony Company** of Boston, and in New York State by **Chas. V. Haynes**, formerly with the **King Manufacturing Company**, Troy, N. Y.

FLASHINGS.

J. REILLY, JR., Bridgeport, Conn., has about finished the metal work on the St. Augustine's church. Besides the handsome copper cross which he has just placed on the top of the spire, he has taken the slate from the sides of the clerestory and substituted galvanized iron in imitation of stone. Mr. Reilly has lately taken up the cornice business and is doing considerable in this line.

W. H. MEERER & Co., South Norwalk, Conn., have the contract for the tinning and plumbing of the new building of the **Norwalk Iron Works**.

THE METALLIC ROOFING COMPANY of Canada, Limited, Toronto, Canada, issued their handsome illustrated catalogue for 1895. It is a volume of square shape, contains 100 pages and bound in brown paper covers, the front cover having the design and title printed in bronze. The early part of the volume relates to metal roofs, comparing them with other forms and showing their advantages. The first illustrations show the Eastlake shingles and similarly illustrate the Eureka Diamond tiles; Spanish tiles and Thor's steel roofing come next, and various sorts of crimped roofing, roll cap roofing, &c., are noted. Steel pressed brick, rock siding, steel clapboards are illustrated; special valleys are shown and likewise ridge caps. Conductor pipes, eave troughs and iron shutters follow. Corrugated iron is noted at some length and its various applications illustrated and described. A long chapter is given up to paneled and embossed sheet metal ceilings, of which many handsome designs are presented. At the end of the volume illustrations show a number of different prominent buildings upon which the products of the **Metallic Roofing Company** are used.

THE TUCKER MFG COMPANY, successors to the **Sims Mfg. Company**, Newark, Ohio, publish their catalogue for 1895, which will be of particular interest to the roofing and cornice trade. It is a volume of convenient size, bound in paper, with gilt title, and contains over 50 pages. The line of goods referred to embraces a very extensive assortment of roofing specialties. A place of prominence in the beginning of the publication is given to **Sims' eave trough**, which is well-known to the trade. The trough is fully described and illustrated in many different views, and a price list is presented. Conductor pipes of various sorts are similarly referred to, and attention will be attracted by the malleable conductor heads for square corrugated pipe, which are of handsome design. A number of different malleable conductor bands from 2 to 5 inches, for square and round pipe, are illustrated. Next follow adjustable elbows, corrugated elbows and shoes, pipe fasteners, hooks, strainers, &c. Two pages are given to the **Tucker hanger** for eave troughs; then other styles of hangers are illustrated

and described. Ridge rolls, roof gutters, ridgings and creatings follow in the order named, after which attention is given to galvanized iron cornices. Finials are shown in many different designs, and toward the end of the pamphlet attention is given to metal ceilings, siding, chimney tops, &c. At the close is an alphabetical index.

A. H. BUCKINGHAM, New Haven, Conn., has the contract for the metal work on the new St. Elmo club house on Grove street; **F. L. Leighton & Co.'s** new store building in Wallingford, and the new Rafael flats on Oak street.

Much sympathy will be felt with **John K. Allen**, publisher of *Domestic Engineering*, whose mother, **Mrs. N. B. Allen**, died last week. Mrs. Allen, who was of New England parentage, was born in Union N. Y., in 1836. She married **John M. Allen** in 1846, and resided at Gaea Lake, Mich., for twenty one years, later removing to Lansing, where she lived until 1888, when her husband died. She then went to Denver, where she resided with her daughter. The funeral was held at the latter's house last Sunday afternoon.

Last week the **Pittsburgh Reduction Company** of Pittsburgh, Pa., manufacturers of pure aluminum, shipped a carload of aluminum plates to the **Herreshoff shipyard** at Bristol, R. I., for use in the construction of the racing yacht "Defender." The plates are about 12 feet long, vary in width from 23 to 30 inches and are $\frac{3}{8}$ inch thick. They are for the top sides of the yacht and are lighter than the plates of manganese bronze that will be below the water line. To give them added strength and ductility it is stated that the new plates contain about 10 per cent. of copper.

Experiments which were recently undertaken by the Army Department to ascertain the suitability and durability of aluminum for army canteen purposes in connection with such articles as knives, forks, spoons, plates and dip-pers, are reported as not having turned out so entirely favorable to the metal as its friends would desire on account of the alloys used for hardening it not being found suitable. The knives, forks and spoons used for the experiment contained a considerable alloy of copper, and the medical members of the board were of the opinion that the presence of this metal would probably prove detrimental to the health of the men using the utensils. Nevertheless, the military authorities have not given up the idea that aluminum will some day enter largely into the composition of many articles used in the military service. In addition to table and kitchen ware it will very likely be utilized to a considerable extent in the manufacture of portions of harness, insignia and military trappings generally.

The conning tower of the battle ship "Massachusetts," now building at Cramps' shipyard, which has been recently completed by the **Bethlehem Iron Company**, is one of the largest steel castings ever made. It is a hollow cylinder 7 feet 3 inches in diameter and a little over 7 feet high, and is cast in one piece, like a locomotive tire. When placed on board the "Massachusetts" it will be topped by the wooden pilot house, from which the ship is steered when not in action.

Mammoth Tubular Furnace.

MaGill & Diedrich, Bloomington, Ill., are manufacturing a tubular furnace adapted to the use of hard or soft coal or wood. It is made in 15 sizes, suitable for use in buildings of any character. The accompanying illustration shows their new Mammoth furnace, especially designed for the warming and ventilating of schools, churches, court houses, large residences, &c. Part of the furnace is shown broken away to expose the interior construction. It is built entirely of cast iron. The sides of the fire pot are corrugated, to prevent damage from expansion and contraction as well as to furnish greater heating surface. The fire pot is protected by perforated linings, which can be easily removed and replaced by new ones at but

ing gas or smoke. The size shown weighs 5400 pounds. A common complaint against furnaces burning bituminous coal is that the flues become clogged and inoperative from soot forming in them. This difficulty is overcome by making the flues easily accessible for cleaning from the front of the furnace through the fuel and feed doors, as shown in the illustration.

Manual Instruction in Australia.

We have received from Melbourne, Australia, a copy of the 1895 prospectus of the Workingmen's College in that city, an institution founded in the year 1883 "to improve the education of workmen and to facilitate the attainment of a more thorough knowledge of handicrafts, arts, sciences and lan-

course, to those students who pass these examinations successfully. "Experts' certificates" are given to students who, after having gained the ordinary certificate, complete another year's course and pass an additional examination in the higher branches of the subjects studied. Unfortunately, no details are given in the prospectus with regard to the curriculum or general plan of instruction followed. In the plumbing and gas fitting classes one evening each week is devoted to theoretical instruction by means of lectures.

The college is evidently in a very flourishing condition, as mention is made of the fact that as many as 2600 students were enrolled during one quarter. The total cost of the buildings and equipment of the institution is said to have exceeded \$250,000. Its operations cover quite a wide field of educa-

Mammoth Tubular Furnace.

slight expense. The rocking grates are operated from the front of the furnace by a lever arrangement, so contrived that when the lever is taken out of the socket the grates are locked, making it impossible for them to dump when firing or when a poker is run over the grates. An ash dump directly under the fuel door facilitates the removal of ashes and clinkers, by removing them from the fire chamber to the ash pan without taking them through the fuel door, thus obviating complaint on account of dust. A specially noticeable feature of this furnace is the distance from the combustion chamber to the flue. In the No. 8 furnace, for instance, which is the one illustrated, the smoke and other products of combustion travel a distance of 40 feet before entering the flue, thus pretty thoroughly extracting all the heat to be derived from the fuel and necessarily effecting great economy. The passage of the smoke is clearly indicated in the illustration. The tubes are cupped and the sides flanged and put together with asbestos cement, then tightly bolted with $\frac{1}{4}$ inch machine bolts, so that no danger exists of escap-

guages." From this prospectus are gathered the following facts in regard to this institution: The work of the college is divided into a number of separate departments, one of which is termed the Department of Mechanic Arts, where instruction is given, by means of evening classes, in carpentry, plumbing and gas fitting, metal turning and fitting and coach building and carriage drafting. The minimum age for admission to these classes is 14 years.

In the plumbing and gas fitting department the instruction is progressive, there being three separate classes or grades in which are taught, at different times, both the theory and practice of the trade. Fees of \$2, \$2.50 and \$3 per quarter are charged respectively for each term in the three grades. Juniors under 18 years of age and indentured apprentices under 21 are admitted at half these fees. The class work of each year is divided into four terms of ten weeks each. Examinations are held in July and December of each year. The ordinary certificate of the college is granted, at the end of a two years'

tion, the departments being as follows: Literary and Commercial; Mathematics, including arithmetic, algebra, geometry, mensuration and trigonometry; Science, including geology, mineralogy, theoretical and practical chemistry, dynamics and heat, and magnetism and electricity; Art and Applied Art, including free hand drawing and painting, modeling, gilding and marbling, sign painting, &c.; Engineering, including instruction in practical plane and solid geometry, steam and steam engine, surveying, applied mechanics, mechanical drawing, &c.; Architecture, including building construction, architectural drawing and sanitation; Agriculture and Rural Industries; Household Economy; Music; and separate subjects, such as Photography, Telegraphy, &c. The fees for all these courses appear to be low enough to place them within reach of everybody.

Some Australian capitalists have lately visited Gloversville, N. Y., with a view to the establishment of a silk mill at that place.

THE RETAIL STORE.

Myers' Spray Pumps.

F. E. Myers & Bro., Ashland, Ohio, are putting on the market the three spray pumps here shown, in addition to those already offered by them to the

Fig. 1.—Imperial Brass Spray Pump.

trade. The Imperial pump, shown in Fig. 1, is described as being compact, unusually strong and of large capacity; as having an adjustable fastener for any height or shape of pail; as being provided with a removable cap, so that the

Fig. 2.—Knapsack Spray Pump.

buckets can be taken out without disarranging the pump; as having double leather plunger buckets, ground brass valve seats and superior valve, and as

being fitted with an agitator and improved combination nozzle, fitted for sprayer and pipe extensions. The knap sack pump, Fig. 2, is made of first quality galvanized iron, with round corners, a removable strainer and tight lid. The pump is fitted with adjustable straps, so as to be carried on the back, or it may be carried by the bail, as shown by the dotted lines. It is tapped

Fig. 3.—Barrel Spray Pump.

at both right and left hand lower corners and fitted with brass female ends, to which the hose is attached, both of which may be used at the same time. It is explained that when one hose only is used the other opening is closed with a metal plug furnished for the purpose. It is stated that the hose and bulb are made of the best white rubber, and are protected at each end by coiled wire to prevent breaking; that the valves are of brass, so as not to corrode, having large openings to permit the free flow of water and to shut off immediately when under pressure. The nozzle is of brass, nickel plated, with 50 small openings, throwing, it is claimed, a spray 6 feet wide at a distance of 12 feet. The pump holds 5 gallons and weighs 52 pounds when full. The barrel spray pump, Fig. 3, is constructed with a base adapted to be fastened on sinks and platforms, so it may be used for a house force pump in cisterns, shallow wells, or at any place where a neat, powerful force pump is required. When used for house purposes it is furnished, it is remarked, with a discharge spout, elevated to the proper height. The cut shows the pump fitted with an extra large air chamber. The cylinders, brackets, valves and valve seats, it is explained, are of brass. The manufacturers state that the pumps have proved themselves a decided success when used for whitewashing, the high pressure put on the fluid causing it to penetrate the crevices in the surface.

Truss Bottom for Fiber Ware Pails.

The cuts shown herewith represent a new bottom for their fiber ware pails, recently invented and introduced by the Standard Fiber Ware Company, Man-

Truss Bottom for Fiber Ware Pails.—
Fig. 1.—Section through Unfinished Pail.

kato, Miss., which they style a truss bottom, and which is claimed to be much superior to anything of the kind hitherto introduced. Fig. 1 shows the initial position of the side, bottom and steel band. In Fig. 2 is shown the finished pail after powerful steam rollers have compressed the bottom and side into one compact body and banded them together immovably by means of a steel band. At top and bottom the pail is strengthened and protected by means of cold rolled steel bands. By this system the company find that they have overcome the objections hitherto discovered in connection with the molded or seamless fiber ware pails—namely, that the bottoms were weak and had a tendency to soak up heavy or break from brittleness. They inform

Fig. 2.—Section through Finished Pail.

us that they have also succeeded in producing a new finish for their fiber ware which imparts to it a handsome appearance and at the same time renders it absolutely water proof.

MANNINO, BOWMAN & Co., 57 Beekman street, New York City, advise the trade that they expected by this time to have announced their new location, which they gave notice of February 15. The result of looking for a suitable second floor salesroom was, however, discouraging, so they have accepted an offer of their present store without the stock rooms where they have heretofore carried their line of Perfection Granite and Decorated Pearl Agate Ware for the local trade. After closing out what they have left in these lines they will have only their New York salesroom

and office at the old stand and will ship all goods from their factory at Meriden, Conn.

The Griswold Coffee Mill.

Griswold Mfg. Company, Erie, Pa., are putting on the market the coffee mill here shown. The mill is cast all in one piece, including the base, and is fastened on a wooden block. The top hopper box is covered with a neat revolving cover. The mill is provided with a stamped tin cup for receiving the ground coffee, the point being made

The Griswold Coffee Mill.

that this results in a neat, clean affair with no rough wooden drawer or corners to collect dirt. The mills, it is stated, are of the best cast double burr pattern, grinding very fine. They are furnished in black japan finish, neatly striped with gold bronzes.

Golden Crown Butchers' Meat Tray.

The Stuart & Peterson Company, Burlington, N. J., are introducing trays, one of which is here shown. The trays are made of iron, porcelain lined, with the outside finished in blue enamel, having an edge to protect the

Golden Crown Butchers' Meat Tray.

porcelain. The trays are referred to as being as necessary to a well appointed meat market as a marble counter, and doing away with wood trays, which become meat soaked and offensive in odor. The trays are designed for the use of butchers, dealers in fish, groceries, vegetables and also for confectioners. The trays are made in three sizes—from 29 to 36 inches long, 20 to 27 inches wide, and 2½ to 4 inches deep, each one being packed in a separate box ready for shipping. The company loan small models to customers for canvassing purposes, and furnish circulars on which their name does not appear.

Christy Model No. 16 Bread Knife.

The Christy Knife Company, 88 Chambers street, New York, are offering the bread knife here shown. The distinctive feature of the knife is the beechwood handle and German silver ferrule. The blade is described as made

of tool steel, nickel plated. It is made in one size only with blade 9½ inches long, and the handle 5 inches long.

with a ratchet lever fastened to the handle. By slight pressure on the end of the lever the yoke is readily pushed

Christy Model No. 16 Bread Knife.

The knife is designed for cutting hot or cold bread, cake, &c.

The King Grip Burner.

The lamp burner here shown with the King Grip is being introduced by C. A. Taplin & Co., Forestville, Conn. The burner is described as being made of heavy metal, rendering it strong and durable. The points of excellence claimed for the grip by the manufacturers are as follows: That it holds the chimney securely, preventing it shaking off; that it holds the chimney down

Fig. 1.—King Grip Burner.

Fig. 2.—Chimney Ready to Apply.

firmly on the burner, giving uniform draft, clear light and perfect combustion; that the prongs being on the inside do not counteract the expansion of the chimney; that the prongs are always in position to receive the chimney; that the chimney is easily applied and removed; that the burner has an improved spring hinge for holding the cone down securely and that it is devoid of snaps.

open, so that the cloth or mop may be easily placed in position. Then by placing the mop on the floor and pressing down on the handle the cloth is fastened in securely. The adjustment is thus very simple, but positive. The mop is fitted with stained wood handles.

MEMORANDA.

H. C. LARSEN, 23 East Fourteenth street, New York, is making a specialty of the Advance mangle for smoothing table linen and all unstarched cloths and linens. It is adapted for use in private residences as well as in hotels and restaurants. Another of his specialties is the Christensen clothes line fastener.

C. SEYBOLD & SONS have begun business again at their old stand, 510 Clay avenue, Jeannette, Pa., where they are prepared to do tin, slate and gravel roofing, hot air furnace work, &c., and carry on a hardware business.

W. W. PRYOR & Co., factory selling agents, 81 Chambers street, are successfully marketing the Wire Cushion Glass Oil Can, manufactured by the Ohio Lantern Company, Tiffin, Ohio. It holds 1 gallon of oil, and has a tin top and bottom, with tin wire supports connecting the extremes. The cushion around the body of the Can, extending outward about ½ inch, is woven on and made of tinned spring wire. Besides being able always to see the contents of the Can, the small loss from breakage in shipping is referred to especially.

The New York Gas Tubing Company occupy the fourth floor of the large business building at 334 and 336 East Twenty-third street, New York City, where they operate a very complete plant for the manufacture of flexible tubing for use with gas stoves, portable gas lamps, speaking tubes, &c. The increasing demand for this class of goods has taxed the firm's resources to such an extent in the last few months that they have been compelled, in addition, to lease the floor above them in order to extend their plant. Their output of finished tubing last month amounted to 138,000 feet. Their increased facilities will, however, give them a further monthly capacity of from 50,000 to 60,000 feet. The company are proprietors of a patent for an improved end for their tubing formed of rubber, with a nickel collar, which they claim to be the most satisfactory thing of its kind on the market.

The selection of women for executive offices in cities is rapidly becoming common. The Mayor of Chicago has just appointed a woman, Miss Jane Addams, as garbage inspector in the Nineteenth Ward, one of the most unsavory sections of that city. The local papers speak of Miss Addams as a capable woman who is likely to carry out a difficult task satisfactorily.

The burner is designed to accommodate the ordinary sun bulb chimney.

STOVE TRADE NOTES.

Meeting of the National Association.

WEDNESDAY MORNING.

The twenty-fourth annual convention of the National Association of Stove Manufacturers was called to order in the beautiful banquet room of the Auditorium Hotel, Chicago, at 11 a.m. on Wednesday, May 1, by President George D. Dana, with the following members present:

Anthony, E. W., Smith & Anthony Company, Boston, Mass.
 Buttorff, H. W., Phillips & Buttorff Mfg. Company, Nashville, Tenn.
 Barbour, Geo. H., the Michigan Stove Company, Detroit, Mich.
 Brislend, James, Home Stove Works, Chicago.
 Brentano, August, Southern Stove Works, Evansville, Ind.
 Bell, Joseph, Joseph Bell Stove & Range Company, Muncie, Ind.
 Brand, Sebastian, Brand Stove Company, Milwaukee, Wis.
 Burt, N. H., Great Western Stove Company, Leavenworth, Kan.
 Bennett, H. W., Indianapolis Stove Company, Indianapolis, Ind.
 Bowditch, Edward, Rathbone, Sard & Co., Albany, N. Y.
 Boal, Stanhope, the Favorite Stove & Range Company, Piqua, Ohio.
 Brooke, L., Floyd, Wells & Co., Royersford, Pa.
 Cribben, Henry, Cribben, Sexton & Co., Chicago.
 Culter, R. A., Culter & Proctor Stove Company, Peoria, Ill.
 Castle, C. H., Comstock-Castle Stove Company, Quincy, Ill.
 Dana, Geo. D., Excelsior Mfg. Company, St. Louis.
 Du Charmé, C. A., the Michigan Stove Company, Detroit, Mich.
 Dugdale, Joseph T., Western Stove Mfg. Company, St. Louis.
 Dwyer, J., Peninsular Stove Company, Detroit, Mich.
 Duffy, James, Duffy-Trowbridge Stove Mfg. Company, Hannibal, Mo.
 Emery, J. W., Channon Emery Stove Company, Quincy, Ill.
 Filley, Charles H., Excelsior Mfg. Company, St. Louis.
 Goldschmidt, Julius, Brand Stove Company, Milwaukee, Wis.
 Gardner, Fred. W., the Michigan Stove Company.
 Holland, Geo. H., Bridge & Beach Mfg. Company, St. Louis.
 Hawkins, Frederick, the Fuller-Warren Company, Milwaukee, Wis.
 Hunter, John E., Culter & Proctor Stove Company, Peoria, Ill.
 Huntington, C. C., H. Wetter Mfg. Company, Memphis, Tenn.
 Joseph, W. E., Patton Mfg. Company, Columbus, Ohio.
 Kernan, Francis, Syracuse Stove Works, Syracuse, N. Y.
 Kahn, Lezard, F. & L. Kahn & Bros., Hamilton, Ohio.

Lansing, J. A., Scranton Stove Works, Scranton, Pa.
 Leonard, J. J., the Toledo Stove Company, Toledo, Ohio.
 Lee, Fred. E., Estate of P. D. Beckwith, Dowagiac, Mich.
 Magee, Frank A., Magee Furnace Company, Boston.
 Moore, W. N., Joliet Stove Works, Joliet, Ill.
 Moore, Lewis, Joliet Stove Works, Joliet, Ill.
 McClure, J. H., Phillips & Buttorff Mfg. Company, Nashville, Tenn.
 Mixer, Frank, Rock Island Stove Company, Rock Island, Ill.
 McKnight, M. B., Mount Penn Stove Works, Reading, Pa.
 Moffatt, Albert, Collins & Burgie Company, Marengo, Ill.
 McAfee, D., Thomas White Stove Company, Quincy, Ill.
 Mitchell, George, Pittston Stove Company, Pittston, Pa.
 Moran, F. T., Peninsular Stove Company, Detroit, Mich.
 Overacker, Joseph P., O. K. Stove & Range Company, Louisville, Ky.
 Patton, A. G., Patton Mfg. Company, Columbus, Ohio.
 Prizer, Charles S., Orr, Painter & Co., Reading, Pa.
 Peck, E. W., Co-operative Foundry Company, Rochester, N. Y.
 Perry, Nathan B., Perry Stove Company, Albany, N. Y.
 Resor, I. B. Wm., Resor & Co., Cincinnati, Ohio.
 Raftery, Edmond, Rathbone, Sard & Co., Chicago.
 Renaolds, R. G., Richmond Stove Company, Richmond, Va.
 Sard, Grange, Rathbone, Sard & Co., Albany, N. Y.
 Sard, W. H., Rathbone, Sard & Co., Chicago.
 Seelye, W. G., S. S. Jewett & Co., Buffalo, N. Y.
 Stevenson, W. S., Thomas, Roberts, Stevenson Company, Philadelphia.
 Streeter, L. D., Corning Stove Company, Corning, N. Y.
 Shick, Robert P., Orr, Painter & Co., Reading, Pa.
 Shaw, Bartlett M., Walker & Pratt Mfg. Company, Boston.
 Sattler, Fred., Belleville Stove Works, Belleville, Ill.
 Thompson, George, Enterprise Stove Company, Vincennes, Ind.
 Trowbridge, C. H., Duffy Trowbridge Stove Mfg. Company, Hannibal, Mo.
 Terstegge, H., Terstegge, Gohmann & Co., Louisville, Ky.
 Van Cleave, J. W., Buck's Stove & Range Company, St. Louis.
 Veite, H. A., Fuller & Warren Company, Troy, N. Y., and The Fuller-Warren Company, Milwaukee, Wis.
 Venn, James A., Rathbone, Sard & Co., Aurora, Ill.
 Van Wormer, J. J., Van Wormer & Co., Albany, N. Y.
 Van Evers, De Witt, Brand Stove Company, Chicago.
 Wells, I. H., Collins & Burgie Company, Marengo, Ill.
 Whitehead, W. H., Chicago & Erie Stove Company, Erie, Pa.

Walker, Arthur W., Walker & Pratt Mfg. Company, Boston.
 Wilton, H. Leonard, Art Stove Company, Detroit, Mich.
 Wewers, Wm., Gem City Stove Mfg. Company, Quincy, Ill.
 Will, Fredk., Sill Stove Works, Rochester, N. Y.
 Rodgers, Spencer C., of Rodgers, Ruso & Kelly, stenographers, Albany, N. Y.

J. W. Van Cleave was elected secretary *pro tem*. The opening session was devoted to reports of officers. President Dana, in his report, touched upon a number of practical questions of much interest to the members, his opinions being received with many expressions of strong approval. The reports of the secretary and treasurer dealt with matters of routine. The following firms presented applications for memberships:

Corning Stove Company, Corning, N. Y.
 Sherrmaa S. Jewett & Co., Buffalo, N. Y.
 The Anshutz Bradberry Company, Pittsburgh, Pa.
 Walker & Pratt Mfg. Company, Boston, Mass.
 S. B. Sexton & Son, Baltimore, Md.
 A. Bradley & Co., Pittsburgh, Pa.
 Pittston Stove Company, Pittston, Pa.
 Collins & Burgie Company, Marengo, Ill.

WEDNESDAY AFTERNOON.

The members of the association were addressed on Wednesday afternoon by John B. Kirk of Chicago, vice-president for Illinois of the National Association of Manufacturers of the United States of America, who laid before them the claims of that association for the active support of all American manufacturers. Mr. Kirk's remarks were well received.

M. D. Talcott of Chicago made an application to the association for their indorsement of his credit bureau. The subject was referred to a committee.

An interesting discussion took place on the equalization of prices for molding in competing centers. This was followed by another discussion on the best methods of producing smooth surfaces on castings. The convention then adjourned to permit the room to be placed in order for the banquet in the evening. In former years the banquet was a feature of each annual gathering of the stove manufacturers, but for some time it has been discontinued. The enthusiasm with which the project has been received this year and the large attendance assured make it extremely probable that the annual banquet will again become a part of the proceedings of these conventions.

The Banquet.

The banquet on Wednesday evening was a grand success, and great credit is due to Fred. W. Gardner, who arranged the details and overlooked nothing that was likely to add to the enjoyment of those present. The tables were arranged in horseshoe form and decorated with flowers. A mandolin orchestra furnished delightful music during the dinner. At the head of the table sat President Dana of the National Association, President Cribben of the Defense Association, Past Presidents Sard and Barbour and other men of national prominence in stove councils. The total number present was 86, considerably surpassing expectations. The list included, in addition to the members previously named :

Rev. D. Carson.
M. J. Powers.
O. G. Thomas.
Charles A. Gilpin.
Joseph Leon Gobeille.
H. F. Frohman.
John A. Penton.
John Hill.
E. W. Abrams.
C. W. Sisson.
T. F. Hull.
George W. Cope.
J. K. Hanes.
J. Y. Whiting.
H. K. Spencer.
E. A. Ireland.
D. M. Ireland.
C. H. Matthews.
L. M. Dyer.
J. C. Fry.
K. Henry Gleason.
B. W. Dodson.
C. M. Helmar.
Daniel Stern.
C. T. Finn.
W. H. Dwyer.
T. J. Hogan.
E. C. Hanrhan.
T. S. Bowman.
F. C. McDonald.

The menu was tastefully printed on heavy beveled cardboard. After the cigars had been lit, President Dana rapped attention and paved the way for the *post prandial* exercises in a very neat speech, remarking incidentally that if any evidence was needed of an improvement in the stove trade it could certainly be found here. Grange Sard was called upon to respond to the toast "The National Association." He gave a brief history of the organization, which was founded in 1871, dwelt on the influence it had extended on the stove trade and recapitulated with pride the record of the past few years. Stove manufacturers can truly say that they have not ground the faces of the poor and cut down the wages of their men. The stove trade is unique in not having reduced the wages of employees. Manufacturers have paid 100 cents on the dollar and kept business in solvent condition, almost absolutely free from fail-

ures. All this has been done largely through the influence of the National Association.

Henry Cribben spoke to "The Defense Association." He outlined the policy of that organization and stated that its crowning glory is that through it means had been devised to avoid strikes and lockouts.

W. S. Stevenson responded to "The Best Girl of the National Association—the Pennsylvania Association."

W. H. Sard to "The Northwestern and Southwestern Associations."

Rev. Dr. Carson to "The Ethics of Business Life," in which he advised his hearers to make good goods, then get a good price worthy of the goods, and so always be able to give a good price to employees.

Fred. W. Gardner responded to "New Dress in Stoves."

Fred. E. Lee of Dowagiac to the toast, "Keeping Everlastingly At It."

Geo. H. Barbour to "The Mayor Detroit Might Have Had."

W. G. Seeley to "The Return of the Lost Sheep."

M. B. McKnight to "The Gospel of Pessimism."

Lizard Kahn to "A Good Thing—Push It Along."

C. S. Prizer to "Sunshine in the Stove Trade."

Henry Gleason to "Profit Sharing."

Geo. W. Cope to "Power of the Press."

Francis Kernan to "Tammany Hall."

A. C. Mott to "Bimetallism."

J. W. Van Cleave to "Whisky, Women and Hores."

August Brentano to "Literature of the Stove Trade."

Before parting a toast was drunk in silence to the memory of D. M. Thomas.

THURSDAY.

Thursday morning session was wholly given up to a discussion of cost sheets. It was opened by J. W. Van Cleave, who read an able paper on the subject, which was supplemented with illustrations on a blackboard. The members took very great interest in the matter, keeping up a running fire of questions, which were readily answered by Mr. Van Cleave.

The session on Thursday afternoon was devoted to miscellaneous business, largely of a routine character. The business prospects for '95 were thoroughly discussed from the standpoint of representatives of the several sections, and the general agreement was that they were quite promising.

The following officers were elected :

President, Lizard Kahn.

First vice-president, J. W. Van Cleave.

Second vice-president, Julius Goldschmidt.

Treasurer, W. S. Stevenson.

Secretary, T. J. Hogan.

Executive Committee—C. S. Prizer, George D. Dana, Francis Kernan, F. D. Magee, Fred. W. Gardner and C. C. Huntington.

The convention adjourned to meet in New York on the first Monday in May, 1896.

Meeting of the Defense Association.

The Stove Founders' National Defense Association held their annual convention in the Auditorium Hotel, Chicago, on Tuesday, April 30. It was well attended. Two sessions were held, one in the morning and the other in the afternoon, adjourning shortly after 5 o'clock.

Henry Cribben presided and E. W. Peck acted as secretary. Reports were presented from the several officers reviewing the occurrences of the past year. President Cribben's report was lengthy, covering the actual work done by the association. The relations between the manufacturers and their employees were shown to be harmonious, presaging another year free from labor troubles. Allusion was made to the less sustained by the association in the death of D. M. Thomas, the late secretary, and a committee consisting of Henry Cribben, Grange Sard, George H. Barbour, Lizard Kahn and E. W. Peck was appointed to co-operate with a like committee from the National Association of Stove Manufacturers in taking suitable action thereon. The affairs of the association are prosperous. Three more firms were admitted to membership at this meeting.

The election of officers resulted as follows:

Henry Cribben, president.
W. T. Bradberry, vice-president.
T. J. Hogan, secretary.
A. C. Mott, treasurer.

Committee for Second District:

Grange Sard,
C. S. Prizer,
D. G. Rennolds,
N. B. Perry,
E. W. Peck.

Committee for Third District:

Jeremiah Dwyer,
W. W. Baldwin,
James Dwyer,
I. B. Resor,
W. T. Bradberry.

Committee for Fourth District:

C. H. Castle,
N. H. Burt,
G. D. Dana,
J. W. Van Cleave,
J. Goldschmidt.

The first district, which comprises New England, has never been organized.

The preceding list shows that all the old officers have been re-elected, except in the case of the secretary. The association expressed their preference for T. J. Hogan to fill the vacancy caused by the death of Mr. Thomas. Mr. Hogan was the choice of practically the entire body, making him a formidable candidate for the secretaryship of the National Association of Stove Manufacturers. He will not be a new man in this position, having been secretary of both

organizations in 1890-91, when he discharged the duties devolving upon him very creditably. He will therefore enter upon the work well equipped to handle the important business connected with the office of secretary. Mr. Hogan was connected with the Bridge & Beach Mfg. Company of St. Louis after his retirement from the secretaryship and until the beginning of the present year, when he transferred his connection to the Perry Stove Company of Albany, N. Y. He will in all probability make his headquarters in Chicago. The association has made an excellent choice in recalling him to fill the position of secretary.

Trade Representation.

—THE IRELAND & MATTHEWS MFG. COMPANY of Detroit, Mich., were represented by both Messrs. Ireland and Matthews. They made an exceedingly fine display of urns and nickel plated steel rims. Prominent among the urns were ornate finished pieces with a great variety of trimmings. A stove manufacturer could here take his choice of a body in almost any color, finished in a dead plain or fluted surface and graced with arms of cast or wrought brass. The urns now being presented for the favor of the trade are finer than anything ever before manufactured, and yet they are sold at prices marvelously cheap. The nickel plated steel rims were shown in a number of patterns, from rims for ranges to circles for the tops of oak and other cylindrical stoves. They also showed beautiful statuettes, among them being reproductions in miniature of the famous Montana silver statue, shown at the World's Fair.

—THE MATTHEWS & WILLARD MFG. COMPANY of Waterbury, Conn., were represented by E. A. Ireland, who made a beautiful display of strikingly handsome urns. The finest were ornate urns with satin finish, made to endure heat without injury. The firm have engaged in the ornamental brass business, so that they are prepared to make the finest kind of goods in his line with the highest finish. Their urns are tastefully decorated with cast and wrought brass and copper arms in graceful designs.

—HENRY GLEASON, 106 Beckman street, New York, exhibited a small but exceedingly choice line of samples. In the matter of urns he has made a new departure, eschewing the filigree work of his competitors and adopting a style of decoration designed to harmonize with the usual decorations of a room. His urns are finished in oxidized silver, with various designs on the sides in *bas relief*. He also displayed a line of samples of gas stove cocks, air mixers, &c. Mr. Gleason is agent for the Simpson-Fry Mfg. Company of Brooklyn, N. Y., gas cocks and gas stove appliances; New Jersey Lamp & Bronze Works, New Brunswick, N. J., urns; Trent Tile Company, Trenton, N. J., tiles; Matthews Mfg. Company, Worcester, Mass., stove knobs, and New York Nickel Plating Company, New York. C. J. Fry of the Simpson-Fry Mfg. Company was also in attendance.

—W. E. FINN of the Troy Nickel Works, Troy, N. Y., was on the ground with a line of samples of the famous Alaska cold handle stove trimmings, which do not make as artistic a display as high art urns, but are nevertheless fully as attractive to manufacturers of stoves.

—THE S. OBERMAYER COMPANY of Cincinnati, Ohio, and Chicago, Ill., manufacturers of foundry facings and supplies, were represented by H. F. Frohman, Wm. N. Wilson and John Hill.

—SAMUEL SMYTH of Pittston, Pa., well known to the stove trade, was present and greeted his old friends.

—THE TRADE PRESS was of course well represented. *The Metal Worker* occupied its old headquarters on the sixth floor, near the entrance to the banquet hall, and was favored with a constant stream of visitors.

The Local Stove Trade.

The promise of better times in the stove business which the demand of January, February and March held out was not materially strengthened by the results for April, though there is no ground to lose hope. Sales during April were a trifle more than those of April last year, and probably would have been more in excess if the weather had not been so cool as to delay house cleaning and removals, which are responsible for the greater portion of the traffic at this season in the stove and housefurnishing goods business.

The tendency is certainly toward improvement in this and other lines, and though unfavorable conditions of weather serve to retard present business, still the increased number of callers and talk of prospective orders and possible contracts indicate future business improvement. There are numerous contracts and orders booked for the installation of ranges, furnaces and fire place heaters for individual house owners—a branch of the business that practically came to a standstill within a short time after the commencement of the panic of '93, and in which there has been but little done ever since till now, orders for such goods being confined almost entirely to the wants of builders. There is a noticeable increase in the demand for small ranges and small laundry stoves, such as the people in poor and medium circumstances purchase, indicating that there are fewer idle men.

A very gratifying sign which holds out much promise for the future of the stove business and augurs well for the return of prosperous times is the increased number of orders, through export commission men, for stoves for foreign countries, showing a healthier condition of business not only in this country but in many foreign countries in which the depression of trade was nearly as great as it was here. Collections continue slow, though this is probably to be expected where dealers require increased stocks and are obliged to wait on their customers for money to pay for larger quantities of goods than they have been recently in the habit of carrying.

Wm. McCullough.

Wm. McCullough, secretary of the Anshutz-Bradberry Company, at Pittsburgh, Pa., manufacturers of Tremont stoves and ranges, died at his residence in Allegheny on Saturday, the 27th ult. Mr. McCullough was born in Washington County, Pa., but went to Pittsburgh when a young man. For a number of years he was with the R. & W. Jenkinson Company, tobacco manufacturers, of Pittsburgh. Fifteen years ago he left that concern and entered the employ of the Anshutz-Bradberry Company. When the firm was incorporated four

years ago he was elected secretary, and he occupied that position at the time of his death.

George W. Swett.

George W. Swett, one of the most prominent of the stove manufacturers of Troy, N. Y., died at Albany on the night of April 21. He was ill more than two weeks, having been taken sick while in the capital city. The report of his death was received in Troy with the greatest surprise, as none except his nearest relatives had known that he was ill.

Mr. Swett was about 76 years of age and had been for 43 years actively engaged in the iron foundry and stove business at Troy. He was born in Essex, N. Y., and removed to Troy when a young man. In 1852, with J. F. Quimby and Harlow Bennett, he embarked in the manufacture of stoves under the firm name of Swett, Quimby & Co., in the plant now known as the Empire Stove Works. The firm prospered and were succeeded in 1867 by Swett, Quimby & Perry. Mr. Bennett retiring and his place in the partnership being taken by Samuel Perry. The death of the latter occurred in the year 1883 and Mr. Quimby died in the year 1886, when the name of the firm was changed to George W. Swett & Co. Mr. Swett at that time associated with him Frederick A. Swett.

Mr. Swett was twice married. His second wife, by whom he had two sons, Alfred and Charles, died in 1893. By his first wife he had one son, George B. Swett of Chelsea, Mass., who is manager of the Swett Car Wheel & Foundry Company of that place. Mr. Swett was active in Masonic circles, at the time of his death being identified with King Solomon's Primitive Lodge. He was also a member of the Troy Yacht Club and several other organizations.

Plating Stove Ornaments.

BY THE HANSON & VAN WINKLE COMPANY.

For several years the ornamentation on stoves has been steadily increasing, not necessarily in quantity, but rather in quality or artistic effects, and manufacturers are forced to constantly change or improve designs on trimmings to be plated. To bring out all the minute lines or figures requires more skill and care on the part of the molders than on patterns for other parts of stoves, as they have learned from past experience that castings must be clean and free from hard burnt spots and all sand removed, otherwise the plating will be of irregular color and without nickel where traces of sand remain.

Only the best quality of facing sand should be used for this purpose, but no amount of care will entirely remove all the causes of defects; consequently other means must be employed. As far as possible pickling should be avoided, as it is often detrimental to good plating, but it is sometimes necessary. In the writer's experience the Acme chemical solution is the least injurious, and if instructions are carefully followed will remove all silica matter, leaving the iron perfectly clean. The work should then be thoroughly rinsed in cold water and then dried off in hot water. As an extra precaution against bad effects of acids it would be well to neutralize the acid with some alkali solution. All castings should be well scratch brushed before going to the polishers, as this gives the background

a better luster and at the same time removes any loose sand that may cling to the casting after being tumbled.

Polishing.

The first process in polishing is termed "roughing out." Various wheels are used for this operation—wood wheels covered with leather, canvas wheels, or bull neck wheels. The wheels to be used will depend on the surface of the work to be polished. The wheels are "set up" with emery Nos. 60 to 90, depending on the condition of the castings. The wheel is first coated with glue and rolled in emery until a heavy coat adheres to it; it is then laid aside in a warm place to dry, after which it should be perfectly balanced before putting it on the spindle of the lathe.

The next operation is called "second roughing" or "finishing down," and is similar to the first operation except that a separate set of wheels are required, which are usually "set up" with emery running from No. 90 to 120. The grade of emery used in this operation will depend on the grade used in "roughing out." The next operation is termed "greasing" and is nearly always done on bull neck or felt wheels, although the leather covered wood wheels can be used for this operation when the surface is large and flat. Felt or bull neck wheels are soft and will readily adjust themselves to the curves of the castings. The wheels should be "set up" with emery from No. 120 to 180 and, after drying and balancing as before, they should be used for a few minutes to take off the sharp cutting points of the emery. Then take a piece of tallow, beeswax or other greasy substance and run it over the face of the wheel until you get an oily surface. Should the wheel become too smooth and not cut fast enough lump pumice or emery cake should be applied to liven it up and clean out gummed grease.

The last operation in polishing is called "coloring" and is done on wheels similar to those used in "greasing," except that the wheel receives very little grease and is then polished or glazed by running a hard flint stone over its face. The wheel should be worked down until its use on the castings produces a very high polish; this is the most careful operation of all if good work is desired, as the higher the glaze on the wheel the better will be the color on the work after plating. In each of these operations the polisher should be careful to remove all traces of scratches left by the preceding wheel, otherwise valuable time is lost in correcting the work of an incompetent polisher.

Plating.

The plating room should always adjoin the polishing department, but they should invariably be separated by partitions, as the dirt or emery dust from the polishing process is detrimental to good plating. It is perhaps unnecessary to say that the plating room should be well lighted and so arranged that everything can be kept as clean as possible. Nickel plating is not in itself difficult, but the solution is extremely sensitive and a very small quantity of foreign matter embodied in the solution (usually through uncleanness) will often cause endless trouble.

The hot and cold water tanks, also the lye kettle and scrubbing sinks, should be placed so that the plater can work the various operations in succession without retracing any steps. The tanks for solution should be made from

white pine or cypress and carefully lined with Trinidad refined asphaltum. Before this asphaltum "sets" go over it with a hot smooth iron to take out any air bubbles, then sprinkle liberally with clean dry sand.

The nickel solution can be made from carbonate or chlorides, but the double sulphate of nickel and ammonia (commonly called nickel salts) solution is the simplest and most convenient. The salts should be dissolved in a clean earthenware jar with a steam pipe, or else in some wooden vessel that has never been used for any other purpose. In dissolving this use nothing but nickel salts and clean water. If water is not clean your solution will not plate white. If steam jet is used for this it would be well to let steam blow through the pipe for a few minutes so that all grease, rust or other foreign matter is expelled before using on salts. Nickel solution when ready for use should stand from 6½ to 7° Baume hydrometer. This will require from 12 to 14 ounces of salts for each gallon of water. Should the solution be too strong and crystallize add a little warm water occasionally until it stops. Keep an even temperature of 60° to 65° in the plating room if possible, especially in winter.

Stove work and all iron castings of large surface require an excess of anode surface, and it is economical to hang in as many anodes as possible on each side, and they should be from 18 to 24 inches deep. The dynamo current is also of great importance; you want plenty of it, and in selecting a dynamo this point should be considered above all others. There are several good machines to select from, others that are a source of constant trouble.

After work leaves the polisher's hands it is taken to the plating room and wired up with fine copper wire, then suspended in the lye kettle; this is a strong hot solution of lye. The work should remain in this solution for five or ten minutes in order to cut all the grease or dirt left by the polishing wheels and in handling; the work is then immersed a few seconds in a dilute muriatic acid dip (about 1 part of acid to 6 of water). It should then be dipped in clean cold water, next scrubbed well with powdered pumice stone, then rinsed again in clear cold water, when it is ready for the plating tank. Until a plater becomes accustomed to the work, he should examine each piece carefully before hanging it in the nickel solution to see that all grease or dirt has been removed. This can be determined by observing the action of the water on the work. If the water adheres all over after dipping, it is clean, but should spots appear where water does not run, then the scrubbing operation must be repeated. After this operation the work should be taken immediately to the nickel tank and suspended from the rods on the tank. As a plating current is not intense, all rods and connections must be kept bright and clean in order to get a perfect contact. A strong current can be used on work when first placed in the tank, and if too intense can be reduced through the rheostat after the work is well "struck up." If the work burns on the edges there is too much current, and it must be reduced until there is no further tendency to burn. If two or more tanks are used a separate rheostat should be attached to each tank. Work being plated is left hanging in the solution from 20 to 25 minutes, depending on the current, strength of solution, anode, surface, and quantity of work in the tank. A little experience will soon determine

the length of time required to give the best results.

After the work is plated it is rinsed off in clean cold water, then hung in boiling hot water until thoroughly heated. It is then removed and swung in the air by the operator until all moisture has disappeared. It is very important that this hot water be clean, as otherwise the work will be stained.

The next and last operation is "buffing" in order to give the article a luster, as all nickel work on iron comes from the tanks a dull white. For plain surfaces the buffing is done with a loose cotton or muslin wheel, on which is applied crocus composition or nickel rouge. For name plates or other parts having backgrounds which must be left a dead white, and on which only the raised parts are to be buffed, a felt wheel should always be used, on which should be applied a Vienna lime composition. If in this operation the buffs or wheel leave any dirt or grease, the work should be again washed in a lye solution, rinsed in cold water and dried with the hot water, the same as described above.

A Furnace Text-Book.

Under the title of "Heating and Ventilation," the Craig-Reynolds Foundry Company of Dayton, Ohio, are issuing what they term an "Everyday Treatise on the Principles of Ventilation, with Facts and Figures." The book is written by George T. Hoffman, a member of the American Society of Heating and Ventilating Engineers and manager of the Western branch of the house, at 82 Lake street, Chicago. The preface states that when the writer first entered the heating business one of the great drawbacks was the almost entire absence of any accurate data on which to base the calculations necessary for an intelligent adjustment of the sizes of pipes, registers, radiators, &c., to equally warm and ventilate different rooms in a given building. It states that the mass of scientific literature is of very little assistance to the average engineer, and that the treatise is issued with the idea of meeting this lack of simple rules and data. The book, which is said to be published in the interests of the trade, is of more than ordinary value. Each of the subjects treated is handled simply and conclusively, and the rules laid down are of such a positive nature as to give a basis for the judgment which it is said must be used in the application of all rules of heating. This feature of these rules will make them more highly valued by those for whom the book is compiled than the elaborate formulas affected by some engineers in their calculations. The topics discussed are furnace heating, combination heating, determining the proportion of radiating surface, ventilation, relation of moisture to heat, determining the efficiency of a warm air heating apparatus, suggestions for hot water piping, hot water heating, and estimates and adjustments. The book also contains simple estimate forms such as are used in connection with the Triumph warm air furnace and combination heating plants. Two pages are devoted to special information about the Triumph line of heaters. A number of tables are included, giving data of value to the heating engineer. The book contains an engraving showing the main office and works of the company, at Dayton, and of the Western branch. It also shows on one page a half-tone engraving of the different styles of Triumph furnaces.

More East Side Chat.

BY JEREM.

Many of the East side stove dealers are pretty hard to get along with both in buying and selling, although some are very prompt and agreeable to do business with. But before they get posted the salesmen used to have pretty tough work to make sales. The New York manufacturers used to have a variety of discounts from their list prices, ranging from 5 to 50 per cent. off, with an additional cash discount according to circumstances. Usually the latter was not deducted until the account was settled. As these people were constantly niggling on terms and prices not much compunction was used in cutting off the 5 per cent. and the rows and rumpuses about "ber cents" and selling goods to these people were numerous. When they first began to go to business two or three would go around the market together pricing stoves and the big percentage used to catch them. "Vot! you don't gif 10 ber cents off only; ve ged fifty ber cents; you take fifty ber cents we make a bargain vid you." But no matter what the bargain came to the jaw was tremendous to reach it. Then they got to figuring so many stoves for so much money, and when the salesman had figured it all up, with all the discount for spot cash and they got the net amount, they would coolly ask, "Vell, how much goes off for der cash money?" "For heaven's sake what do you take me for?" says the aroused salesman. "You got me to figure this all up, there are all the discounts off and now you want to know how much is off."

"Vell, dey tooked ber cents for cash next door, and off you didn't ve buy dere."

Then the salesman, fearing he will lose the cash customer, begins to haggle, and about the size of it is that the Skinnowskies get the goods. They soon got on to the book racket and learned to hang on to the "cash money." They would get the spot cash bill made up, and if it was for \$100 they would offer "fifty down and vill pay you in thirty days." Of course, the jaw would begin again, and after the saintly salesman had cursed them and called them everything, they would tell him: "Vell, if you doud vont to make pizness ve ged him down de street; de machent been by our store and say he trust so long what we like," and negotiating begins again, and rather than let people down the street sell them the salesman thinks he will copper the \$50 and chance them 30 days for the remainder; so he agrees to the bargain. After more talk and when he thinks it is settled, Levi says: "Vell, how much ber cents goes off now?" This last remark paralyzes all the virtue and sabbath training that the salesman ever had; he breaks out in a strain of profanity that would annihilate any other race of people, but this crowd takes it coolly and chew the stinkadoras that the good hearted salesman provided them with and prepare to leave. They wander all around every store and go through the same performance all over the street.

Now that many of them are established in the trade their peculiarities are well known, and every concern gets a hack at some mighty tough customers; though they may be financially responsible, yet the bother and trouble in settling up accounts is so vexatious that they get fired out of one house only to get into another, and the same performance is gone over.

This old fellow whose portrait heads

this article is one of the terrors. He is good for what he buys, but it is impossible to get settlements without a fight. Many of these people go down town Saturdays to transact business, as they have on their synagogue clothes; but they do not always carry their synagogue teachings with them, any more than many of their Christian brothers. But the pertinacity of one of the former going for his "ber cents" is equal to a fight to the finish.

This last concern who had Kroski wore themselves out and finally brought him up with a round turn. So he came down one day to square himself. It must be said that politeness in manner

More East Side Chat.—Vot! Der per cents doud go off? Mine Cote I'm Ruint!

is not lacking in these people, so he greeted the bookkeeper pleasantly and said:

"I come down to find out how much I own you."

"Time you did," jerked out the bookkeeper; "if you hadn't we would have had the sheriff in your place tomorrow morning. Sure."

"Vot! Would you sue me? Aind I good enough?"

"I don't care how good you are. I want that money. That's all."

"I doud own you much."

"I don't give a d— how much it is, I want the money. Give me \$32.18 and get out of here."

"Vot!" shrieked Kroski, "dirty dwo tollars. I doud own half that."

"You lie, you do; shell out now," Kroski nearly got crazy with excitement. "How you make dat? You got credits with shorts and der stove vot I sent back."

"Yes, I gave you credit for them, and you lied like the devil about it."

"Me lie! Me lie! I never told a lie in my life."

"Well, you lied about that stove, anyway," and here was another war of words.

Then the boss pitched in and the porter was called up, and a first-class jaw was in progress. Finally the boss said: "You will pay every cent of that account or I will sue you."

Suddenly an idea struck Kroski.

"Did you doud der ber cents off?"

"Took the per cent. off? Not much! Suppose we are going to wait a year for you to pay up and take off discount! Now give me the money and get out. I got you fast. You ain't got any more bills out of me, and every bill you have says you have got to pay in 30 days to get the percentage. Hurry up; I ain't going to stand here all day fooling with you."

"Vot! der ber cents don't go off! Mine Cote, I'm ruint!"

And away went Kroski in a fit of excitement and rage that would lead one to think he was being murdered. But it was no use; the boss was bound he should pay, and he made him fork over every cent, and the tears rolled down his cheek at the idea of being robbed of "der ber cent." He went out of the store and swore "he never buy a dimed cent dere. If you give him to me I wouldn't tooked dem."

About an hour afterward he came back and said to the bookkeeper: "Sent me two 7 and one 8 Blue Light."

"Where's your money," asked the bookkeeper.

"Vot! Aind I good enough? I doud own you anything, do I?"

"No! Nor you won't. so shell out."

"Vell send me up C O D."

"No, sir. Money down."

"Vot! You fraud."

"Now you put up or get out. I have had enough of you; don't want to sell you for cash! You hear."

"Vot! You doud want to make pizness for cash money. Mine Cote, vot a fool you is," shrieked Kroski, horrified at the idea.

"Now see here, get out; you can't have them anyway."

"Vell here is five tollars. I paid der rest ven he gida up."

"You put down all that money or I will fire you out."

So Kroski reluctantly counted out the amount, squealed for something off for cash money and drove the bookkeeper to madness. Then when he got his receipt he asked him for a cigar, and he got it.

After lighting it he coolly pulled out a wad of bills and triumphantly told the bookkeeper he "didn't give a dime cend if any one trust him. I got der cash money and I pay if I want to," and he strutted out as proud and as happy as a peacock. The chances are dollars to doughnuts that he will get on that concern's books again before the year is over and they will go through the same scrap.

THE CLEVELAND FOUNDRY COMPANY of Cleveland, Ohio, have recently added a new line of low priced hot plates to their already extensive assortment of these goods. Their entire line of Puritan gas cook stoves or hot plates is shown in a special 16-page catalogue which they have just issued and which they will mail to any dealer on application. They are also extending their line of warm air registers by adding new sizes and styles and are prepared to fill orders for these goods promptly.

ODD PLATES.

THE ENTERPRISE FOUNDRY COMPANY, Rochester, N. Y., favor us with their illustrated catalogue and price list. It is a neat publication, bound in paper, with a gilt title. The goods made with this concern include hot air registers and ventilators, border frames, &c., plumbers' goods and hardware specialties. A very great variety of register designs are shown in the opening pages and a fine effect is given by printing several of the designs in gold, silver and bronze, showing the actual appearance of these finishes. Some information is given on the setting of floor registers and a table of dimensions of registers, ventilators, &c. The plumbing and hardware specialties are included in the latter part of the book and cover a number of articles of interest to our readers. Sinks, traps, ventilating caps, boiler stands and brackets are some of the goods referred to. The last section is devoted to iron lugs, jacks, &c.

THE SELECT ESTATE is the name of a high grade gas range which is being put on the market by F. & L. Kahn, Hamilton, Ohio. The edges of the top have a knife sharpening device, and the oven door is provided with an oven thermometer. The range is handsome in design, and is embellished with nickel. It has a large oven with broiling space beneath. The range can be furnished with a water heating device when desired, for connection with the ordinary kitchen boiler.

THE GORBELLE PATTERNS COMPANY of Cleveland, Ohio, sent out during the past week a very neat announcement to the effect that Mr. Gorbelle would be at the Auditorium Hotel, Chicago, from April 30 to May 3, inclusive, where he could be consulted by stove manufacturers with regard to changes in and additions to their stock of patterns. The announcement was printed on white china silk, which in turn was mounted upon a piece of heavy cardboard ornamented with a border in old gold. The make up was unique and entirely in keeping with the announcements usually issued by this enterprising concern.

W. KINNEY of the Ohio Stove Company, Portsmouth, Ohio, favored the Cincinnati office of *The Metal Worker* with a pleasant call recently. Mr. Kinney reports a satisfactory demand for the goods produced by his company and prospects for fall business bright.

THE BONNET & NANCE STOVE COMPANY of Quincy, Ill., closed their works last week for the purpose of putting in a new boiler and making other improvements. As soon as the work is completed the plant will resume operations.

WE HAVE BEFORE US a 24-page pamphlet constituting a directory of the furnaces manufactured by the Fuller & Warren Company of Troy, N. Y., and sold in Cleveland, Ohio, by Holmes & Hickox of 308 Prospect street, that city. The opening pages illustrate the Fuller & Warren Company's Guaranteed furnaces, made both in portable form and adapted for brick work, while the bulk of the pamphlet contains testimonial letters, together with a partial list of names of the people in Cleveland who are using the company's heaters.

THE SURPRISE GAS CONVERTER is the name of a device which is being offered the trade by McCahan & Co., 8

North Central avenue, Baltimore, Md. The device is intended to be placed in the fire box of a stove or range and use ordinary illuminating gas as a fuel. The single converter has two burning nozzles, and is claimed to be of such capacity that with the device any cooking can be done which an ordinary three-hole gas stove will do. Sad irons can be heated, and by using a sheet iron oven on top of the stove baking can be readily accomplished. Another advantage claimed for the Surprise Gas Converter is that the stove can be quickly cooled after cooking is completed by removing the lids to the boiler holes. With each device is furnished a key for turning the stop in the center, one end of the key being suitable for use as a stove lifter.

THE DIGHTON FURNACE COMPANY of North Dighton, Mass., recently made a shipment of a carload of stoves to California by rather a roundabout route. They went from North Dighton to New York by railroad, thence to Aspinwall on sailing vessel, across the Isthmus to Panama, and from there to San Francisco on another sailing vessel.

THE CLEVELAND STEEL RANGE COMPANY of Cleveland, Ohio, were granted a permit last week for the erection of a three story brick structure on the northwest corner of Detroit and State streets. The main building, which will be used for the manufacture of steel ranges, will be 44 x 166 feet in size, while the office building will cover an area of 19 x 54 feet. It is stated that \$5000 will be the cost of the structure.

LEWIS & WANNER have begun the manufacture of steel ranges at 69 and 71 West Jackson street, Chicago, Ill., and have adopted the name Peerless for their line. They propose to confine their attention exclusively to this one line of domestic steel ranges, and announce their determination to make every one right. The Peerless line is furnished in 12 styles, guaranteed to burn any kind of fuel. The key plates, centers and covers have 1-inch rib to prevent warping. The main top plate is made in four sections. The fire box has rounded corners. Grates are flat draw center, double action or duplex. They can be removed through the grate door without disturbing the linings or water front. The oven is ventilated and the door is poised on two tempered protected steel springs. Asbestos lining is used on top and front oven plate, back and bottom flues and around the fire box, forcing the heat in the oven, equalizing the oven heat and protecting japanned surfaces. The combined coal and wood door is a novel feature. All the ranges are handsomely decorated with nickel, but are offered at a reasonable price.

HARVEY, DU BARRY & Co. are a new firm in the steam, hot water and hot air heating business at 152 West Twenty-third street, New York. They will make a specialty of the Peninsular furnaces and ranges and of the Jewel gas and gasoline stoves. They will run a line of steel ranges.

A RECENT ISSUE of the *Leeds Sun* is authority for the statement that the Leeds Stove Foundry & Casting Works is to be the name of the concern lately organized for the purpose of manufacturing stoves and castings at Leeds, Iowa. A. E. Stevens of Leeds will conduct the business, and has rented a building on East Floyd avenue for the purpose. The company have purchased a considerable amount of the stove cast-

ings of the works formerly operated by Mr. Paris, and will commence operations at once. The statement is made that the company have over 100 stoves already ordered, and expect to do an extensive business in the styles adapted for kitchen and laundry use.

NOYES & GODDARD of Waterville, Maine, have been meeting with a good demand for their specialties, and notwithstanding the hard times the volume of business last year is said to have been up to the average.

THE ANSHUTZ-BRADBERRY STOVE COMPANY of Pittsburgh, Pa., by means of a four-page folder which they have just issued, call the attention of the trade to the Tremont steel jointless soot, smoke and gas consuming furnace. The pamphlet is printed in colors, and shows the appearance of the furnace when set in brick work. This heater is referred to as having all seams tightly riveted, sectional hollow air lined straight sided fire bowl, any section of which can be removed or replaced through the fire door at the end; duplex revolving and rocking sectional grate, large ash pit and other features of novelty. The furnace is made in six sizes. The company issue a little pamphlet entitled "Pleasant Homes," which tells all about this furnace and gives testimonial letters and references.

THE MOLDERS of Troy, N. Y., were delighted with the starting on April 30 of the large stove foundry of Burdett, Smith & Co. in that city. The foundry had been closed for a long period, but while it has not been busy in making stoves, a number of needed repairs have been completed. The stock of stoves in the warehouses has been completely exhausted and the company have already on hand a large number of orders waiting to be filled. The prospect for a busy season is excellent.

THE NOVELTY GAS & OIL STOVE COMPANY, 25 East Fourteenth street, New York, are making a display of a number of high grade gas ranges, among which are the New Era gas range, made by the New Era Gas Appliance Company, Chicago; the Select Estate, made by F. & L. Kahn, Hamilton, Ohio, and the M. & D. range, made by the Mason & Davis Company, Chicago. This range represents the steel construction, and has a number of special features. A broiling oven is located where ordinarily a high hot closet is found. The burner under the oven is made to swing and is attached to the lighting door, so that when the door is opened the burner is brought outside the stove so that it can be readily lighted. It has the regular baking oven and cooking holes on the top, and can be furnished with a coil for heating water in connection with a kitchen boiler. They are also showing the Stewart water heater, which is designed for use in connection with the ordinary range boiler. Another of their attractions is a clothes dryer for use with a laundry stove.

THE PENINSULAR STOVE COMPANY of Detroit, Mich., favor us with a circular illustrating and describing a new furnace known as the Peninsular and which is fitted with triplicate heating surface radiator. It is especially designed for heating cottages, small houses and apartments in which previous provision has not been made for a warm air heating apparatus. In view of this the furnace is built low in height, so that the radiating surface and air space are brought in close contact with the fire, and so arranged as to give

three separate fire surfaces on the radiator. It is provided with the company's patent duplex grate and annular shaking ring, has a feed door opening 12 x 12 inches, heavy double fire pot, deep ash pit, extra heavy castings and is adapted to all fuels. The construction is such as to give great heating capacity, the largest size, it is stated, having a heating capacity of 36,000 cubic feet. This size is only 63 inches in height with casing, and allows of an air chamber 14 inches high on top of the radiator, from which may be used 12-inch heating pipes.

A. WEISKITTEL & SON of Baltimore, Md., have just made a number of improvements in their plant whereby their manufacturing facilities have been considerably increased. They have purchased four adjoining structures, which has given them additional space of about 75 x 150 feet, on which they have erected a two story building. A portion of the ground floor will be used as a brass foundry, this giving the firm additional room in the iron foundry. It will also increase the nickel plating facilities to double the former capacity. The changes will also give room for about 20 additional mounters, so that the increase in the working force of the plant will be about 35, making the total number employed over 300. The firm have also added many new labor saving machines to nearly every department of the works, the brass finishing department receiving six new lathes. Weiskittel & Son state that the additions and improvements which they have completed will double their facilities and place them in a position to more satisfactorily meet the wants of their constantly increasing trade.

ONE OF THE INTERESTING EVENTS in Detroit last week was a horse show, which competent judges declared to be superior in many ways to any ever held in the country. The feature in which the members of the stove trade will be particularly interested is the fact that the three horse team of the Peninsular Stove Company carried off highest honors in this class and was awarded the blue ribbon of the meeting. As the company very tersely put it, "all of which goes to show that the good qualities possessed by Peninsular stoves have the very natural tendency of placing the Peninsular Stove Company's horses where their stoves are always to be found—superior to all others."

THE PECK WILLIAMSON HEATING & VENTILATING COMPANY, with main office and factory in Cincinnati, Ohio, have issued an enlarged edition of catalogue B, reference to which was made in these columns a few weeks ago. The publication is entitled "Voices of Experience from Warm Homes," and consists for the most part of testimonial letters from some of those who have used the company's heaters. There are also numerous illustrations made directly from photographs of buildings in which the company have placed their heating apparatus. The latter portion of the catalogue contains, in addition to these photo reproductions, many illustrations of various forms of the company's heating apparatus. The catalogue is exceedingly neat in its make up and the illustrations throughout are of a high order of merit.

THE KEELEY STOVE COMPANY, Columbia, Pa., are introducing the Columbian Syph, a new direct draft single heating stove in four sizes, with triplex or center draw grate, dust flue

attachment and nickeled trimmings. The center parts and the magazine may be lifted out at the top without removing bolt or screw. They are also introducing the Columbian Era, a new straight draft double heater in three sizes—a handsome low priced stove, nicely nickeled and with or without canopy top; the Columbian Pride, an air-tight double or single heater, having a hot air cap to complete it for a single heater, also having the cast cylinder and grate so adjusted that all dead matter is easily freed from the cylinder without dust. Ironstone or cast linings are provided as may be required for bituminous or anthracite coal. The stove is full nickeled and is introduced as an air tight hot air stove, not self feeding. Another new heating stove is a style of their Columbian Sun sheet iron stove in two sizes, having a double top and nickel foot rails, name plate and spun urn. They are also augmenting their line of Columbian Tropic single heating stoves by the addition of two larger sizes. Some changes are being made in their line of furnaces. The Columbian Banner furnace has a new drop ash door, and the line of Columbian Vulcan furnaces will be made on the double drum construction plan. The latter furnaces will also be made in styles having cast cylinders for anthracite coal and clay linings for bituminous coal. The styles made on the crab construction plan will be made without change.

THE BLACKMORE HEATING SUPPLY COMPANY, New York, representatives of the Craig-Reynolds Foundry Company, Dayton, Ohio, are settled in their new office and showrooms at 99 Beekman street. At one side of the sample room is a No. 323 Steel Triumph, 420 Air Blast Triumph and 440 King Triumph, complete in their galvanized casings. On the opposite side of the store one size larger of each of these heaters is shown without the galvanized casing. All the furnaces have fire pots with the extended pin surface. The Steel Triumph has a steel annular drum surrounding the center fire dome, through which the products of combustion pass before they are discharged. The Air Blast Triumph has an extended upper dome, with outlets to an annular radiator which is below it and partly surrounding the fire pot. It also has a device by which jets of air are thrown into the combustion chamber at the surface of the fire, to promote combustion with hard coal and to insure successful combustion when soft coal is used. The King Triumph is of cast iron, one section resting on the fire pot containing a dome, with a series of outlets into which fit an upper circular smoke radiator, by which a large heating surface is exposed. The large plate glass windows at the front of the store will be used for displaying a line of Ornate radiators, made by the United States Radiator Company of Saltsburg, Pa., who have placed their New York agency with the company.

THE QUICK MEAL STOVE COMPANY, St. Louis, advise us that their business for the month of April shows an increase over the corresponding month of last year of over 30 per cent. Their gas stove business is also steadily increasing. Their Quick Comfort line of refrigerators which they placed on the market this season is meeting with a favorable reception at the hands of the trade.

EVANS & CO., 119 Beekman street, New York, are rearranging their sample rooms. They make a specialty

of the Rival ranges and the line of stoves made by the Lebanon Stove Works and of the Gold Coin goods made by the Bussey McLeod Stove Company. They are making an elaborate display of the line of Gold Coin oil stoves. These stoves have a cast iron oil tank cast in one piece. They are also showing the Model oil stove, made by E. Bement & Sons, and a large line of refrigerators.

JAMES & KIRTLAND are now occupying the entire building, which is six stories high, at 110, 112, 114 and 116 Beekman street, New York. They will now use the entire first floor, which has six plate glass show windows, as a sample room, the second floor being fitted as offices. One of the new lines which they have added to their assortment is the New Process gas ranges. In a portion of their showroom will be displayed a line of Capitol, Hecla and Mascot steam and hot water heaters, made by the United States Heater Company of Detroit, in charge of W. S. Newkirk, who is their New York representative.

THE CLEVELAND FOUNDRY COMPANY, 107 Beekman street, New York, are using 291 Pearl street as a warehouse for their line of Puritan gas and oil cooking appliances. The removal of the stock from their old warehouse is an opportunity for a display of the executive ability of Shipping Clerk Louis Fitzmaier.

I. N. TRATCHER has moved around the corner from his old stand and is now prepared to fill orders for stoves and stove repairs at 115 Beekman street, New York. One side of his sample room is occupied by Senator ranges, made by Rathbone, Sard & Co. J. D. Marvin, their New York representative, has his headquarters here and displays conspicuously one of their new Snap ranges.

THE STOVE MANUFACTURERS' REPAIR ASSOCIATION are moving across the street from their old stand, and are preparing to ship orders for stove repairs and furnishings from 230 Water street, New York.

EVANS & CO., 119 Beekman street, New York, have recently made a large shipment of Gold Coin oil stoves to Lima, Peru.

H. W. HUNTER, representing F. & L. Kahn & Bros., Hamilton, Ohio, has been in the city for about ten days exhibiting a new range at the store of the Novelty Gas & Oil Stove Company in Fourteenth street. Mr. Hunter reports that he has had a very satisfactory trade on his constructions for gas fuel and the company have all they can do to fill orders.

THE LEBANON STOVE WORKS, Lebanon, Pa., are introducing the Princess, a new six-hole range with right hand oven and end hearth, and having a device for heating an upper room. They are also attaching a reservoir to their Banner range and are making other changes in their line in readiness for the coming season.

L. M. ARMOR, manager of the sales department of the Anshutz-Bradberry Company, Pittsburgh, Pa., will have the sympathy of his many friends in the trade in the death of his wife, which occurred on Sunday, April 28, at 4 p.m.

The commencement exercises of the evening education classes of the Young Men's Institute, 222-224 Bowery, New

York, closing the ninth year's work of the institution, were held in the Institute Hall on Thursday evening, May 2, when certificates and prizes were awarded to 65 young men for proficiency in arithmetic, bookkeeping, stenography and typewriting, freehand, mechanical and architectural drawing, carriage drafting, steam engineering, practical electricity, plumbing, &c. The programme of exercises included the rendering of vocal and instrumental music, addresses by various persons interested in the educational work of the Institute, and the formal presentation of the prizes and diplomas. The young man standing highest in each class received, as a prize, a book or a fountain pen, except in the class for architectural drawing, the prize for which was a scholarship in the Art Students' League of New York City. These educational classes have proved highly successful in their operation. Four hundred and sixty-three young men attended the evening classes during the past season, as compared with 425 in the previous season. The next session will be opened October 1, 1895.

Trade Notes.

THE LITTLE ROCK (ARK) WIRE WORKS have been organized, with \$10,000 capital.

THE STANDARD FIBER WARE COMPANY, Mankato, Minn., manufacturers of plain and decorated Household Utensils, advise us that in order to meet the growing volume of business they are now making some considerable alterations to their plant, including a new water proofing plant of a special character. The company have recently received many gratifying testimonials on the improvements they have made in their goods.

THE PHILADELPHIA WHITE BRONZE MONUMENT COMPANY, Pa., issue an oblong pamphlet calling attention to the White Bronze as a substitute for stone, marble and other mortuary material.

THE PROPERTY of the Bertha Zinc & Mineral Company at Pulaski, Va., has been sold and will hereafter be known as the Bertha Mineral Company of New Jersey.

THE KOKOMO BRASS FOUNDRY, Kokomo, Ind., has been sold to Chicago capitalists, who, it is said, will double the capacity of the plant.

THE LARGE FACTORY of the American Stamping Company, 108 North Third street, Brooklyn, manufacturers of Stamped, Japanned and Pieced Tinware and Galvanized Ironware, is now running with a good volume of orders, especially in the line of seasonable goods, such as Cokers, Water Cans, Watering Pots, &c. The tinning department of the concern has been shut down since the reduction of duty on the plates and will probably not be restarted. The American Stamping Company's New York office is at 104-106 John street.

IN THEIR ANNOUNCEMENT elsewhere in this issue Meuter Brothers & Co., Brooklyn, N. Y., call the attention of roofers to their brand of Iron Roofing Tin, each sheet of which is stamped. They describe this plate to be the same as that made 50 years ago, not only in the coating, but of genuine charcoal iron.

J. M. & L. A. OSBORN, Cleveland, Ohio, call attention in their announcement this week to a 10 foot corrugated

and plain round Conductor, lap and slip joint galvanized Gutter; also Mitters, Hangers and other fittings.

THE GENEVA TIN WORKS COMPANY of Elmira, N. Y., have been organized with the following officers: T. C. Maxwell, president; S. H. Hammond, vice-president; directors, O. J. C. Ræe, W. G. Dove, S. H. Hammond, T. C. Maxwell and E. H. Palmer of Geneva; Irving Rouse of Rochester and David Hunt of New York City.

THE BEARDSLEY MFG. COMPANY, Cleveland, Ohio, send out a collection of advertising material calling attention to some of their specialties, which include the Economic Self Basting Steam Roaster, Japanned and Galvanized Measures, Flaring Grain Measures, Paint and Oil Cans, Fire Shovels, &c. One of the advertising cards is a prettily decorated monthly calendar sheet and another, equally useful, is a blotter.

THE COHES TUBE WORKS, COHES, N. Y., have moved their New York office across the street to the Cornell Building, 141 Centre street.

A MEETING of the Board of Directors and of the stockholders in the Pittsburgh Plate Glass Company was held in the Carnegie Building, Pittsburgh, Pa., last week. The stockholders adopted the by-laws compiled by the Board of Directors and ratified the actions of that body in the formation of the trust. They also elected the following officers for the coming year: John Pitcairn, chairman of the Board of Directors; Edward Ford of Pittsburgh, president; A. L. Conger, Akron, Ohio, vice-president; A. U. Howard, secretary; E. L. Ford, Pittsburgh, treasurer; Artemus Pitcairn, Philadelphia, controller. The above concern embrace nearly all the plate glass concerns in the country, and a selling agency will be established at Pittsburgh, through which products of the different works throughout the country will be sold.

THE METAL REDUCTION COMPANY, 76 Churchhill street, Chicago, have introduced facilities for galvanizing long lengths, and can now handle pieces up to 45 feet. They have thus been enabled to secure important contracts for wind mill tower work. Their galvanizing department is now very busy. J. F. Forsyth, long identified with the pig iron business, is now devoting his energy to pushing the interests of this new but growing concern.

THE WORCESTER ELECTRIC GAS COMPANY, formed for the manufacture of a new gas machine, have been incorporated under the laws of Rhode Island. The capital stock is \$30,000.

B. B. MORRISON, formerly with Bruce & Cook of this city, and more recently New York agent for N. & G. Taylor Company of Philadelphia, has started in business for himself at 231 Water street, New York. Mr. Morrison will deal in Tin Plate, Sheet Iron and Metals generally, as well as Tinners' Specialties.

PETER A. FRASSE & Co., 95-97 Fulton street, New York, importers and dealers in Tools, Machinery, Hardware and Factory Supplies, have just completed a large new File Rack in which to keep their extensive File stock. This company's business, incorporated in 1891, was established in 1816. They are sole agents in America for David Borloz's Swiss Files. The Rack referred to is subdivided into 506 compartments, varying in depth from 12 to 16 inches. It occupies 135 square feet

of wall space, and contains six sizes of bins, ranging from $3\frac{1}{2} \times 3\frac{1}{2}$ to 6×7 inches. These Files are suitable for fine tool makers, die or pattern work, jewelers, silversmiths, lock makers or any work of a similar nature by workers in metals. Among the kinds are: Hand, Pillar, Half Round, Barrette, Square, Round, Tapers, Crossing, Equalizing, Three Square, Cant, Crochet, Pippin, Parallel, Escapement, Riffir, Checker, Broach, &c. Especial reference is made to the completeness of the assortment, which, it is said, would be hard to equal.

THE WÜHLER ALUMINUM COMPANY have removed their office and salesroom from 55 Jackson street to 66 Lake street, Chicago.

Canadian Customs Decisions.

The Board of Customs of the Dominion has made a number of decisions which have been approved by the Comptroller of Customs. Among the rates of duty thus established are the following: Brass, in strips, less than 4 inches wide, 30 per cent.; carpet sweepers, plated, 30 per cent.; carpet sweepers, not plated, $27\frac{1}{2}$ per cent.; cyclometers, 20 per cent.; fittings for cast iron pipe, cast iron, \$10 per ton, but not less than 35 per cent.; fittings for wrought iron pipe, malleable iron, 35 per cent.; galvanized wrought iron tubing, more than 2 inches in diameter, 15 per cent.; grenades, hand, 35 per cent.; Grinnell sprinklers, 35 per cent.; hose supporters, $32\frac{1}{2}$ per cent.; tool handles, entirely of wood, 25 per cent.; tool handles, filled with any metal, 35 per cent.; typewriters, $27\frac{1}{2}$ per cent.; brass tubing, cased, 30 per cent.; cases for jewels, cutlery, &c., filled, 5 cents each and 30 per cent.; copper tubing, brazed, 30 per cent.; oyster knives, 30 per cent.; palette knives, 35 per cent.; putty knives 35 per cent.; steels, butchers', 35 per cent.; steels, table, 30 per cent.

C. N. Hooper of Dubuque, Iowa, is organizing a company with a capital of \$200,000 to manufacture drawn or stamped steel work and enamel on steel and on cast iron. A leading press manufacturer in Europe is making a large press, weighing 25,000 pounds and capable of forming vessels 2 feet deep and 8 feet in diameter. The company will be able with this press to stamp steel work of exceptional size, like bathtubs, sink and sink backs, lavatories, closet tanks, chemical pans, &c., all to be enameled whenever desired.

The United States Patent Office officials are preparing plans for a very important exhibit for the Cotton States Exposition, Atlanta, Ga. It will not attain to that of the World's Fair in size, but the best features of that exhibit will be selected. An effort will be made to render the exhibit specially strong in cotton machinery and agricultural implements and other matters more closely related to Southern industries. A special feature of the Patent Office exhibit will be a demonstration of the various uses to which coal is put, and the manner in which it is mined.

The Mexican Government has awarded a valuable concession, with a subsidy, to the Tampico & Rio Grande Railway, to be built by Chicago and Boston capitalists.

TRADE REPORT.

The Iron Market.

In their eagerness to stimulate buyers the boomers are creating a false situation so far as the relations of manufacturers and their men are concerned. It is all very well to announce advances in price after filling up with work for months to come at the lowest prices, but while makers are trying to get more money for future work the men want a restoration of wages at once. With the newspapers full of reports of improvement, no assurances, however earnest they may be, will convince the men that the day for higher pay is still months away.

Producers have shown a commendable disposition to restore wages when they have really obtained higher figures in their sales. But there is evident impatience in labor circles, and there is some danger of a series of strikes. The Pocahontas Coke men have started it, and there is a rumor that some of the coal miners in Alabama will follow in June.

The most significant report which has gained currency during the past week is that a consolidation is being negotiated between the leading operators in the Connellsville Coke region, and that when effected the price will be advanced to \$1.50 for deliveries after July 1. W. J. Rainey of Cleveland advises us that there is no truth in the report so far as he is concerned. Meanwhile the advance to \$1.35 is not being realized, since round quantities of standard Connellsville Furnace Coke are being offered at \$1.10 @ \$1.15.

The Birmingham Pig Iron makers are jubilant over their achievement in advancing prices and claim to be selling some metal at the best figures established. They have certainly filled up with orders for many months to come at the lowest prices. It remains to be seen how soon Northern sellers will follow them. For anything but small parcels they have not yet done so. The demand is better, but does not yet justify very sanguine views.

Pig Iron.—There is a fair volume of business in the New York market, although the trade has been disturbed by the report of sales of Southern No. 2 Soft Iron last week at prices as low as any made in this section, a shade under \$10 being mentioned. One lot of 1500 tons, one of 1000 tons and a third smaller lot are referred to. It is believed that older options were availed of in these cases. Southern sellers have further advanced prices, but we cannot learn that orders have been placed at the new figures. Northern furnaces have not yet followed suit in this market. We quote \$12 @ \$12.50 for No. 1; \$10.75 @ \$11.25 for No. 2; and \$10.25 @ \$10.50 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.75 @ \$11 for No. 2; \$10.50 @ \$10.75 for No. 3; \$10.50 @ \$10.75 for No. 2 Soft, and \$10.75 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$10 @ \$10.25.

Our Philadelphia advices indicate that in ordinary transactions sellers are getting about 25¢ advance on last week's prices. Large buyers are either already supplied or have had their options extended so as to hold their trade, but concerns whose statements can be relied upon claim nothing beyond this. They say that on carload and 50 to 100 ton lots they get the advance, and except in such special cases as mentioned the advance will become general in course of a few days. Buying is not extremely heavy because of the advance, but sellers feel that they control the situation, and would just as soon keep their Iron as sell it at present prices, as there is a fair chance for a still better market later on. The course of events during the week therefore have been favorable to furnace products. Sales have been at prices as follows for Philadelphia, and 30¢ @ 50¢ less for deliveries at points within 100 miles South or West:

Bessemer		\$12.60 to \$12.75
Standard No. 1 Foundry X.....		12.00 to 12.50
Standard No. 2 Foundry X.....		11.25 to 11.50
No. 2 Plain.....		10.50 to 10.75
No. 1 Soft.....		11.50 to 11.75
No. 2 Soft.....		10.75 to 11.00

Good inquiries are still in hand in the Chicago Pig Iron market. A fair business has been done in local Iron, but sales were not so heavy as in the previous weeks. Excellent inquiries are still coming forward. The improved condition of general business is expected to make more foundrymen busy and to bring in a fresh crop of buyers. The Pocahontas Coke strike may cause some trouble, as a great deal of Coke from that district is used in the local furnaces and foundries. A moderate demand is reported for Lake Superior Charcoal, with prices also a little firmer. Quotations are as follows, for cash:

Lake Superior Charcoal.....		\$13.00 to \$13.50
Local Coke Foundry, No. 1.....		10.50 to 10.75
Local Coke Foundry, No. 2.....		10.25 to 10.50
Local Coke Foundry, No. 3.....		9.75 to 10.25
Local Scotch No. 1.....		10.50 to 11.00
Ohio Strong Softeners, No. 1.....		12.50 to 13.00
Southern Silvery, No. 1.....		12.00 to 12.25
Southern Silvery, No. 2.....		11.75 to 12.00
Southern Coke, No. 2.....		10.50 to 10.75
Southern Coke, No. 3.....		10.00 to 10.25
Southern, No. 1 Soft.....		10.50 to 10.75
Southern, No. 2 Soft.....		10.25 to 10.50
Alabama Car Wheel.....		17.50 to 18.00
Jackson County Silvery.....		15.00 to 15.50
Other Ohio Silvery.....		14.25 to 14.50

Foundry Irons are dull and neglected in the Pittsburgh district. A sale of 500 tons of No. 3 Foundry was made last week at an extremely low price, deliveries running into September. Quotations are given as follows, for cash:

No. 1 Foundry.....		\$10.50 to \$10.75
No. 2 Foundry.....		10.00 to 10.25

Advices from the Cincinnati district are to the following effect: From a local standpoint the Iron situation is one of encouragement. The aggregate tonnage sold during the past week, while not equal to the heavy transactions of the week previous, has been of liberal proportions, and in some respects of a more satisfactory nature. The volume of business created by the advance of Southern Iron noted a week ago and the expectation of a further advance have placed the Southern producers in a still stronger position, which has resulted in another rise

of 25¢ per ton on all grades of Southern stocks for May, June and July delivery, and for later deliveries another advance of 25¢ per ton is demanded. Furnaces along the Ohio east of this point have also manifested a firmer and more confident feeling, instructing local agents to day to advance prices. Orders for carload lots have been numerous, not a few contracts for from 100 to 600 tons and five or six orders of from 1000 to 2000 tons, but no such heavy individual transactions as have taken place for several weeks past have come to light. One feature of interest is the larger relative amount of Charcoal Iron being sold. Quotations are given as follows:

Southern Coke, No. 1.....		\$10.00 to \$10.25
Southern Coke, No. 2.....		9.50 to 9.75
Southern Coke, No. 3.....		9.00 to 9.50
Southern Coke, No. 1 Soft.....		9.50 to 9.75
Southern Coke, No. 2 Soft.....		9.25 to 9.50
Ohio Soft Stone Coal, No. 1.....		14.50 to 15.00
Ohio Soft Stone Coal, No. 2.....		14.00 to 14.50
Lake Superior Coke, No. 1.....		11.75 to 12.25
Lake Superior Coke, No. 2.....		10.75 to 11.50
Hanging Rock Charcoal, No. 1.....		11.00 to 11.50
Hanging Rock Charcoal, No. 2.....		10.50 to 11.00
Hanging Rock Charcoal, No. 3.....		9.50 to 10.00
Tennessee Charcoal, No. 1.....		13.00 to 13.50
Tennessee Charcoal, No. 2.....		12.00 to 12.50

The situation of Pig Iron in the St. Louis market is reported as greatly improved. The past week's business has been larger than any one week for two years past and at an advance of from 25¢ to 50¢ per ton over prices ruling 30 days since. Nearly every large consumer of Iron has been a buyer and some of them have doubled their original orders. No. 1 Foundry is now quoted at \$10 25, f.o.b. cars St. Louis, while No. 2 Foundry is firmly held at \$10. Consumers who have not bought will be disappointed if they expect to be able to fill their requirements at the old price, as furnaces are at present in a more independent position than they have been for two years past, and refuse to accept orders at less than the prices quoted below. Stocks on the furnace banks are unusually light and a still further advance is not improbable. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry.....		\$10.25 to \$10.50
Southern Coke, No. 2 Foundry.....		10.00 to 10.25
Southern Coke, No. 3 Foundry.....		9.50 to 9.75
No. 1 Soft.....		10.00 to 10.25
No. 2 Soft.....		9.75 to 10.00

Metal Market.

Pig Tin.—The market rules fairly strong, with a slight advance in wholesale prices. Speculation has shown rather more spirit, and trade with interior dealers and consumers has been fully up to average volume. Along with light arrivals the distribution has sufficed to reduce stocks in first hands, and while still of liberal amount the holdings are well scattered. Manipulation by the "bull" interest has, however, been a more potent factor in regulating prices. Small business has been satisfactory in volume, and prices for moderate sized jobbing lots of Straits Pig have continued firm at last week's quotations, namely, 15¢ @ 15½¢ per lb. The stock in the United States, exclusive of Pacific Coast, is estimated at 3131 tons, an increase of 440 tons during the past

month. On the 1st inst. there were afloat for this country and landing 805 tons. The visible supply for Europe and America is placed at 23,875 tons, against 18,307 tons a year ago. Shipments from the Straits during April amounted to 4950 tons, including 3050 tons to London, 700 tons to the Continent and 300 tons to the United States.

Copper.—A further advance in wholesale prices has taken place and the market is very firm. Considerable business has been done during the week, chiefly for home trade account. Casting Copper being in special demand. The strength of the market is due in part to light offering and very fair trade demand, but speculative doings and covering of short sales have been something of a factor. No change can yet be made in quotations for small parcels at retail, which remain on a basis of 10½¢ for Lake Ingot.

Sheet Copper.—Some good orders have been placed for Cornice Copper within the last few days. Stocks in consumers' hands are known to be low, and there are indications that retailers and consumers are preparing to buy for stock again instead of confining themselves to the policy of buying only for present consumption, which they have followed for the past 18 months. The outlook is regarded as favorable for a good and improving business in manufactured Copper during the coming months. A strong possibility seems to exist of an advance in prices in the near future should the present advance in Ingot here and abroad be maintained. Quotations on small lots of Sheet Copper from store are unchanged at the net list rate of 14¢ $\frac{1}{2}$ lb.

Pig Lead.—Dealings have been moderate and the demand has shown very little vigor. Sellers have offered rather more freely, but not with pressure sufficient to depress values a great deal. Retail business has only been of a moderate character. Prices for small lots of American Pig rule at 3½¢ @ 3½¢ $\frac{1}{2}$ lb.

Lead Pipe and Sheet.—The condition of the market for manufactured Lead is much the same as outlined in our report of last week. While the consumptive demand is rather more active, the aggregate volume of business still falls short of the average for a good season. Inquiry is somewhat better and the feeling appears to be more favorable toward an improvement in the trade. Prices in this section are maintained on the last basis of 5½¢ for Pipe and 6½¢ for Sheet Lead, subject to a discount of 20%.

Spelter.—There is no change in the market for this metal, business here being rather slow, with large transactions quite the exception. Prices for small lots have remained quite steady at 3½¢ @ 4¢ $\frac{1}{2}$ lb for good Western brands.

Antimony.—Routine business only has been effected and prices are still rather easy, small parcels from store being quoted at about 8¢ for Hslett's and 9½¢ @ 9½¢ for Cookson's.

Tin Plate.—Wholesale business has been unusually flat during the week, some few orders for forward deliveries of Ordinary Cokes being about the only features of any importance. No improvement either in business or in the demand has taken place, and the market is showing rather weak tone, notwithstanding that stocks of imported Plates are far from full, and many foreign makes are out of the market altogether. This condition appears to be offset, however, by the increas-

ing output of domestic Plates, some of which are said to have been placed on this market lately at lower prices than those at which Welsh Plates of corresponding grade could be imported. There has been a fair run of small orders especially for Roofing Plates since the first of the month, but even this trade is considerably below the average of the season. Prices have undergone no positive change, but they depend largely on the conditions of each buyer, and published quotations can only be taken as approximate.

A special London cable dispatch of May 1 to *The Iron Age* reports on the British Tin Plate market as follows: Tin Plate market has been dull and quotations are irregular. Moderate orders have been obtained for special sizes of Cokes, chiefly Canada, and more demand is reported for Oil sizes for Russia. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, 14 1/2 x 20	9/	@ 9/3
Siemens Cokes, 14 1/2 x 20	9/14	@ 9/6
Turners, 20 x 28	18/	@ 22/8
Charcoals, 14 1/2 x 20	11/	@ 13/6

Sheet Iron.—The demand for both Black and Galvanized Sheets continues heavy. Mills are reported to be very busy and some of them are pretty well sold up to July 1. Jobbers, too, have been doing more in the line of Sheet Iron than for some time past, Galvanized Sheets, in small lots, being in quite active demand in this district. Prices are quite firm. Small lots of No. 27 Common Iron are quoted at 2.70¢ @ 2.75¢ $\frac{1}{2}$ lb. Galvanized, under the same conditions, rules at 75 and 5¢ to 75 and 10¢ off, according to size of order and condition of delivery.

Chicago Report.

Scrap.—The demand is good. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb.
No. 1 Wrought Scrap	\$6.50	
Machinery Cast	5.50	
Malleable Cast	5.00	
Stove Plate (free of burnt) ..	4.00	
Burnt Iron and Grate Bars ..	3.00	
Sheet Iron and Hoops	2.00	
Plow Steel and Breaking ..	4.00	
No. 2, such as Shovels, Hoes, &c.	3.00	
Old Boilers—whole (Iron) ..	3.00	
" (Iron)—cut in single Sheets and Rings ..	5.00	
Old Gas-Pipe and Boiler Tubes	5.00	
Cast Borings	3.00	
Turnings	4.00	
Horseshoes	7.50	
Copper Bottoms	6 ¢	
Copper Clips and Heavy	7 ¢	
Heavy Brass	6 ¢	
Light Brass	3 ¢	
Pipe Lead	2 1/2 ¢	
Tea Lead	2 ¢	
Zinc	2 1/2 ¢	
Rubber	4 ¢	

Anthracite.—Trade is quiet. Carload lots of 12 net tons or over are quoted as follows:

	Egg, Sto.	Grate, and Ch.
Chicago, Ill.	\$4.60	\$4.75
Milwaukee, Wis.	4.60	4.75
Kansas City, Mo.	7.80	7.95

Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo.	10.00
All points between Denver and Missouri River	8.85

CONDITION OF THE

Hardware Trade.

ONE OF THE FEATURES of the market is a somewhat firmer tone on several lines of goods, though the improvement is not manifested so much in the way of announced advances as in the withdrawal of ragged extras, extreme concessions, &c. As a result of this, together with a steady business of fair volume, the trade are taking a more hopeful view of the situation and of the prospects for a still further improvement in business. Buyers are still very cautious in placing their orders but are purchasing a little more freely than for some time, there being a number of lines of goods which are regarded by well-informed parties as a safe purchase at ruling prices—that is, for such quantities as are likely to be called for in the regular course of trade during the next few months. It is also a good sign that there is more inquiry for Builders' Hardware, and reports indicate that during the season there will be much more activity in building operations than during the past year. The effect of this will naturally be more fully felt after a little. Mechanics' Tools are also moving more freely, seasonable goods naturally constituting a considerable proportion of current business. There is some complaint in regard to collections, but considering the season the financial situation is not unsatisfactory.

Advices from Chicago.—The Shelf Hardware trade keeps up to its volume for the past few weeks and prospects are excellent for its continuance. Orders continue to grow larger and some disposition is shown to lay in stock slightly in excess of daily necessities. The demand for Builders' Hardware and general building supplies has grown considerably, showing that building is being more actively prosecuted. The demand for Tin and Terne Plates and Galvanized Iron has shown decided improvement since the last report. An exceptionally large trade is being done in Poultry Netting; some houses report the largest trade in this line they have ever had. House Furnishing Goods are moving quite freely, but complaint is heard in a few cases of irregularity in prices, caused by offerings of last season's patterns at reduced prices. Manufacturers in such instances are endeavoring to work off stocks which they have carried over at a sacrifice, which seems to be an imprudent thing to do at this time of the year. Prices are injuriously affected at a time when they should be well sustained. Staple Goods maintain their low range of values without any indication of an early improvement.

Notes on Prices.

Wire Nails.—The Wire Nail market continues in about the same condition as last week, the manufacturers maintaining the slightly advanced quotations. There is also a general disposition to refuse to accept orders for future delivery at prices now ruling,

American Window Glass.

Sizes.	Single.				Double.		
	Prices per 50 feet.				Prices per 50 feet.

The new list for American Glass is the same as that of imported Glass adopted by the New York Importers, October 1, 1894, which is also given herewith, and which is subject to a discount of 70 per cent. for both single and double, with the following exceptions: Each quality of the first and second bracket, both single and double, is advanced 50 cents per box:

glass, one side being of wood. Here an exhibition is given of the use of their fire nozzle, showing how the water can change almost instantly from a constant stream to a large spray. The spray is caused by placing a ball in a funnel shaped opening, which spreads the water, the ball being held in place by the action of the water. In this room two of their ball nozzle sprays are

34 x 58 to 34 x 60.....	17.25	15.75	14.50		22.75	21.25	20.00
36 x 60 to 40 x 60.....	19.00	16.75	15.75		25.50	23.00	22.00

The reason given for advancing the list prices of the first two brackets over that of the importers' list is that these sizes are in the greatest demand and that heretofore they have yielded very little if any profit. As far as we have learned the new list of American Glass has been adopted by all manufacturers and jobbers. A Pittsburgh paper devoted to the Glass interests states that manufacturers seem to have definitely given up the idea of holding another meeting for the purpose of effecting a combination of interests.

arranged so that they gyrate from the force of the water passing through them, showing the application in case of fire, every portion of the room being reached by a jet of water when in operation. In the center of the store they have erected shelving and counters where their business is transacted. In passing from this display into the other store green velvet carpet is arranged to represent lawns, with walks laid out and potted plants and easy chairs arranged as they would be in a well kept ground.

THE AMERICAN BALL NOZZLE COMPANY are making a handsome display of their specialties at Broadway and Thirteenth street, New York, occupying two large stores. A man in livery directs the sightseers on entering the building. The first thing to attract their attention is a fountain with a basin 15 feet in diameter, surrounded by plants and covered by moss, in the center of which one of their ball nozzles is used to make the spray. At one side of this is the statue of a fireman holding their fire nozzle. Back of this display is a room, three sides of which are

THE HERO STAMPING WORKS is the name of a recently organized concern at Cleveland, Ohio, for the manufacture of Furniture, Trunk and Carriage Trimmings, Novelties for the hardware and specialty trade and patented devices of any kind required in stamped goods. They mention that manufacturers using small iron or malleable castings can be supplied with articles similar in shape from stamped iron or steel, which will be just as serviceable and less expensive. The works, which are equipped with the latest machinery, began operations May 1.

A Sewage Disposal Plant.

The new sewage disposal plant with pumping station now being constructed at Reading, Pa., embodies several features of interest. Although the present population of the city is only 60,000, with a *per capita* use of 120 gallons of water daily, the capacity of the plant will be sufficient for a population of 150,000 with a daily use of 100 gallons per capita. Adjoining the pump room, which will have at present only a single pump with a capacity of 5,000,000 gallons per 24 hours, are two receiving reservoirs. From the branch of the main sewer the sewage falls by gravity to these reservoirs, first passing through a suspended screening, which will remove the coarser matter. Beneath these screens and above the surface of the sewage in the reservoirs is a free circulation of air, secured by the action of ventilating flues surrounding the boiler smoke flue and discharging the foul air nearly 100 feet above the ground. The disposal plant proper is located about a mile from this station and consists of filter beds divided into upper and lower sections. The beds or compartments are two storied, somewhat after the manner of the reservoirs at the pumping station. The upper beds, above which are arranged the distributors, are formed of about 2 feet in depth of fine sand properly supported. Eight feet beneath are the lower beds, made of coarse sand upon broken stone, with drains beneath to conduct the purified liquid to the river, on the banks of which the beds are located. The vertical space between the upper and lower beds permits of the thorough aeration of the sewage as it falls.

Artist-Artisan Institute.

The trade and technical schools which are springing up around us show that the practical and theoretical training of the American artisan is constantly re-

ceiving more and more attention. This is a thing to be thankful for and one to be encouraged in every possible way. The borders of general learning have also been enlarged in the common schools, in night schools, in workmen's institutes and similar establishments, so that the young American craftsman of to-day has every opportunity to furnish himself with a good general education at small cost. There is, however, another field of education which seems to have been but little developed as yet in this country. This is the field of industrial art. That the inculcation into artisans of the principles of art, in order to improve their work as artisans, is a very important branch of industrial training, has long been recognized abroad, where instruction in art is often combined with trade education in a manner which is practically unknown in the United States. To help supply this deficiency the Artist-Artisan Institute was started some years ago in New York City. The purpose of its founder, John Ward Stimson, was to teach artisans the underlying principles of art in such a manner as to enable them to combine artistic principles with practical methods. Workers in metal were particularly invited to avail themselves of the opportunities offered by the institute. The fees for instruction were sufficiently moderate to place its advantages within the reach of most workmen, and it was hoped that a large number of the younger craftsmen would be encouraged to support this enterprise.

An Opportunity for Metal Workers.

Judging from an inspection of the eighth annual exhibition of the institute, held last week, it seems that this class of artisans have failed to grasp this opportunity. The exhibits were numerous and very satisfactory of their kind, but they did not include a single specimen of metal work of any description. In fact, it was learned, on inquiry, that the class in metal work had not been started during the past season, as only one application for instruction was received. Beyond specimens of work in the designing of wall papers and book covers, and a few examples of wood carving and modeling, there was hardly anything displayed that might be said to come within the scope of real industrial art. The majority of the pupils appear to have gone in for the "artist" half of the institute's title, pure and simple, while the "artisan" side has been neglected. This is a thing to be regretted, as art schools, as such, are abundant enough all over the country, whereas schools where

artisans may be trained in industrial art are rare. It is to be hoped that the coming season may see more interest evinced by the craftsmen of this city in the work of the institute, as we understand that its managers are extremely anxious to develop this branch of the enterprise more fully, and they are prepared to give every possible facility to artisans desirous of taking a course of industrial art either in wood or metal. There is room for the infusion of much more good art into our decorative metal work, and an institution such as the Artist-Artisan Institute seems to be the only place where the ability to do this can be gained by the ordinary trades man.

The Planished Iron Trade.

Careful investigation of the use of planished iron by railroads discloses the fact that the statement made in *The Metal Worker* a short time since, relative to the substitution of cheap painted or japanned sheets for locomotive jackets, was too sweeping. The movement in that direction has not been of the important character which was anticipated when it was first perceived. It may be set down as exceptional, especially as many railroad officials are of the opinion, based on years of experience, that the use of planished iron is much more economical than cheaper sheets, even though the prime cost is much greater. It may not be known by the trade in general that the continued high cost of planished iron is owing to its very high cost of production. The method of manufacture has not been changed, because it has not been found possible to change it. Although steel is now very cheap as compared with charcoal iron, and has driven iron out of the market in many lines, steel cannot be used in the manufacture of planished sheets. They are made of charcoal iron, precisely as in the days when the use of charcoal iron was quite common and when the planished process was perfected. By this process no acid whatever is used, the sheets are not pickled, but the scale, if there is any, becomes a portion of the surface, forming a protecting oxide. This process has not succeeded with steel up to the present time, notwithstanding numerous expensive experiments. Therefore planished iron is still planished iron and not steel, and its uses are growing instead of diminishing.

Fifteen coal companies operating 23 mines in Iowa have organized to keep up prices and reduce the cost of production.

THE LETTER BOX.

Making Blue Prints.

From H. J., Kingston, N. Y.—I would like very much to gain some information through *The Metal Worker*, knowing that it can assist the practical business man on many different subjects. The progress of the times requires that in the city of Kingston a plumber has to draw a plan of all work that is to be done and must furnish a blue print of it to the officials. You would confer a favor upon me and a great benefit on my fellow workmen if you would let me know how blue prints are made and what is required to make them.

Note.—It is probable that some of our readers have a method and apparatus for making blue prints specially adapted for the requirements of this correspondent and we hope they will describe them. In order that he shall have some information on the subject we give the following:

The process of making blue prints is neither expensive nor difficult. In making a blue print the first thing is to secure a supply of ferro prussiate paper, which may be obtained from any dealer in photographic or artists' materials. If our correspondent cannot obtain the paper he can make it with little trouble. Almost any white paper of good quality is suitable. It is prepared by subjecting it to a sensitizing solution, made by taking 1 ounce of citrate of iron and ammonium and 4 ounces of water, and mixing it with 1 ounce of red prussiate of potassium and 4 ounces of water. The two solutions are mixed in equal quantities and to an amount sufficient to sensitize the paper required for immediate use. The solution may be applied to the paper with a sponge or flat brush, or, if convenient, the paper may be floated in the solution, which is considered the better way. After this has been done the paper should be dried in a weak light. The paper prints better when fresh, and it would be well, therefore, to prepare paper only as required for use. The citrate of iron and ammonium should be kept in a dark bottle from air and light. The paper should be stored in a dry place and be entirely shielded from daylight before being used and while putting it into the printing frame.

After the paper is ready for use and a print is desired the printing frame is placed upon the table and the back board removed. The inked in drawing is then placed upon the glass with the inked side next to the glass, and a piece of ferro prussiate paper, with its colored side toward the drawing, put in. The back part is then placed in position in the printing frame and fast-

ened by slipping the springs attached to it under the buttons screwed on to the frame. The printing frame is then exposed in a place where the sunlight will fall directly upon every part in order to make the print equally intense in every portion, and is left for from 15 to 30 minutes or longer, according to the strength of light and the density of the lines of the drawing. In order to ascertain if the exposure is sufficient the frame may be removed to a place where the light is weak or subdued, one half of the back part opened and the paper bent back in order that the print upon its surface may be seen. If it is clear and distinct the paper may be taken out and placed in a pan of clear water, where it should be left until the whites of the print are clearly brought out. The paper being no longer sensitive may be dried wherever most convenient. If the printing frame containing the paper is not exposed long enough the print will very likely have a pale blue instead of the indigo hue desired. If what should be white in the picture has a blue tint it indicates overprinting or that the picture was exposed to a bright light before the paper was washed. The blue print can be conveniently written on by using a solution of common soda thickened with gum arabic. Adding the soda to red ink will give a fluid by means of which a brilliant red line may be made on the print.

City Farming.

From JOHN COOPER, Boston.—Your remarks upon "City Farming" in *The Metal Worker* of May 4 are both timely and pertinent, as it is not charity that working men ask for, but a possibility to turn their capacities into useful things that is needed so much. And how or why it is that human beings, as a society, can quietly look on and see valuable time wasted in forced idleness is passing strange. The earth is the source from which most of the good things needed can be obtained and labor is a means to that end, and when it can be intelligently directed should make the poor comparatively rich and the rich richer, as that which benefits labor generally sheds its benign influence upon all. Therefore it would appear to be the paramount duty of all to do the best they can to find employment for all at a price that shall return something more than cost. Idleness is the parent of mischief; therefore it is fair to presume that when reasonable occupation can be secured for all, the tramps and other so-called bad people that now trouble society would be eliminated from it. This kind of aid to the working poor may be one of the most humanitarian engagements that has hitherto been undertaken, and if it is

possible to extend it so as to open a way for a broader and better means of turning the forced idle that we constantly have in our midst into industrious people, one of the best means of aiding human progress has been hit upon. General Booth says: "Keep the people employed," and when it can be done I think they will soon become useful, profitable and virtuous members of society. This is an age of new inventions, and why not have one to procure profitable employment for all? This might not be a panacea, but it would be a great help.

Joints in Greenhouse Piping.

From T. C., Boston.—*The Metal Worker* of May 4 contains a rejoinder to "T. C.," who takes no exception to anything said by "W. F. C." concerning things from the Hub. As all good things do not come from any one place, therefore, some good things may emanate from the Hub and even Western wilds. Here one might be facetious, would time or the space of this valuable paper permit it. It would be well for "W. F. C." to give proportional quantities of each material to be used, so that one might be able to speak intelligibly of the dilutant rye flour, which is a quickly destructible ingredient of the proposed compound and time alone can answer as to the value of it. I have seen rust joints after from 10 to 15 years' use made with sal' as well as sal' and sulph', and saw no apparent excessive corrosion adjacent to the joints, so that I think such joints would be good enough for the Hub and Western wilds also.

A Balky Furnace.

From C. H. A., Lansing, Mich.—In answer to "J. H. W.," whose balky furnace is described in *The Metal Worker* of April 20, will say he certainly is not responsible for the furnace not working, for there are many people in this world who do not know when they have a good thing or when a good job has been done for them. In this case "J. H. W." ought not to stand the expense of experimenting in trying to make the furnace do something which it rebels against. If he has to make changes at his own expense the following will help him out. He has placed the air duct at what may be termed the leeward corner of the building, so that the prevailing winds tend to blow past it and suck air out of the duct instead of forcing it in. I would suggest that the duct be placed under the library in the center of the house and run direct to the furnace without any angle in it, but if any angle is necessary the capacity of the duct should be increased one-fourth at the angle. Then for windy, cold weather, a duct with a capacity of 500 square inches should be taken from the hall. This will tend to draw the heat up the pipes that do not work, and by so doing draw the cold air from all over the house. Long hot air pipes should have a rise of at least 1 inch to the foot—more is better. In some cases we have had to put the fur-

nace in a pit a foot or more deep, and in one case sunk it nearly 2 feet in order to get elevation for the hot air pipe. The people using this furnace are better pleased with its work than can be said of any furnace that we have placed in 1895. In this part of the country cold air ducts from the hall are used extensively, and the saving in fuel is at least one-sixth over the consumption with outside ducts. No trouble is experienced

Designs for Drawing Table.—Fig. 1.—General View of Table.

from the lack of fresh air, as plenty is sure to leak into any building. The one great mistake that many furnacemen make is to allow their patrons to dictate to them where they shall locate the furnace, hot air pipes and registers. In nine cases out of ten they have to suffer for doing it. We let the job go to the fellow who will do as he is dictated to by the owner rather than go against our best judgment. In this way, and in this way only, can people be educated and a satisfactory business built up.

Wagon Equipment.

From T. J. EFFINGER, Blacksburg, Va.—Will *The Metal Worker* or some of its readers tell me what would be the best for roofing a light spring wagon? Would a tin roof make it too hot inside? Where can I get a very light cooking stove, to burn wood, which would be suitable for use both in the wagon and outside of it?

Note.—Some of our readers can doubtless give some information which will be valuable to this correspondent. There is no reason why a tin roof should make the wagon any hotter than a canvas roof. If our correspondent desires to reflect the heat of the sun, some advantages can be gained by painting the roof white. The use of tin for roofing light wagons has been satisfactory in a great many cases. Our correspondent can get a stove suitable for his purposes from several different manufacturers if he will state the space which the stove is to occupy and the limit he will put on its weight. A cast iron stove with an oven 12 inches square, weighing 75 pounds, can be had for burning coal, and it will burn wood satisfactorily if the wood be cut small enough to go into the fire chamber. A junior gasoline stove has been used in wagons in a number of cases with excellent results and might be adapted for the present requirements.

Designs for Drawing Table.

From F. K. T., Knoxville, Tenn.—I send inclosed designs of a drawing table, which may be of interest to some of your readers. The frame of the table was constructed to hold a 36 x 60 inch perspective board and to be used with the board as a table when working with smaller boards. A general view of the table is shown in Fig. 1 of the sketches, while Fig. 2 represents a front

elevation and Fig. 3 an end elevation. From an inspection of the latter it will be seen that the top may be adjusted to stand at any desired angle. The principal part of the frame is 2 x 3 inch poplar, stained and finished to represent black walnut. A smaller board as a top and lighter material for the frame could be used if preferred.

Is It Sanitary?

From J. C., Boston.—In *The Metal Worker* of May 4, "B. C. H." of Hayward, Cal., raises a questionable point to answer respecting the sanitary or unsanitary condition of the piece of work shown by his illustration. To say the least, the 2 inch vent pipe should have been continued full size to the end. Even then to decide such a question properly some of the adjacent pipes of

Fig. 2.—Front Elevation.

Fig. 3.—End Elevation.

the system should have been shown. To illustrate what I mean, suppose the 2 inch waste pipe falls into a 4-inch horizontal pipe where air is free to pass then the fixture is perfectly correct as it is. But if it enters a 4 inch upright pipe where other fixtures are connected above the junction of the 2 inch waste connection, falling water from above may at any time in its descent cover that orifice; then the trap as it is shown might be siphoned and therefore the fixture would be unsanitary.

Kitchen Boiler Below Range.

From P. S. J., Jersey City, N. J.—I submit a sketch of a boiler connection which I have made at the earnest solicitation of one of my customers and against my best judgment. The range is a brick set range in the kitchen and the boiler is located in the basement underneath, so that there is a space of about 18 inches between the top of the boiler and the bottom of the water back. After the connection had been completed and the range fired, heat could be detected in the pipe connecting in the side of the boiler as far down as X, and, strange to say, the pipe running to the bottom of the boiler shows heat at a point a couple of feet below this, as

Kitchen Boiler Below Range.

shown by the lower X. I have talked with a number of plumbers about this connection and am told that such connections have worked, while others claim that they will not work. I should be glad to hear from the readers of *The Metal Worker* if it is possible to get a circulation between the boiler and the water back and what must be done to secure it. Owing to the arrangement of the house there is no available place in the kitchen for the

boiler, and it is not desired to put the boiler in the room above the kitchen. I think that there must be some way of making this arrangement work and shall be glad to have the plumbing readers give their experience with jobs of a similar character.

According to the *Tradesman* of Chattanooga, Tenn., there are at present 872 cotton mills building and in course of erection in the Southern States.

The staved or barrel tank made from cypress lumber is the best in all respects, and for most purposes need be no more than of 1000 gallons capacity, or 7 feet high by 6 feet in diameter. The staves may be $1\frac{1}{4}$ inch lumber, bottom $1\frac{1}{2}$ inches thick, with all seams plain and well jointed; six hoops of $\frac{3}{4}$ x 2 inch iron, lapped and riveted with five rivets, $\frac{3}{8}$ -inch, flat heads inside; tank tapering from the top, so as to drive the hoops down.

Iron or steel tanks may be made by sheet iron workers, and for the above size No. 12 gauge iron riveted with $\frac{3}{4}$ -inch rivets and painted inside and out with two coats of red oxide of iron

Where it is convenient to place the windmill over a well, a frame should be made to support the post with guy rods or wooden braces, but in all cases the pump should be placed in a pit to protect it from frost. Where it is convenient to place the mill upon a barn and the pump at some distance, a pair of T bell cranks can be used to convey the power a short distance horizontally from the mill to the pump.

The Scaphander is the name of a device for enabling firemen to penetrate fire and smoke with impunity which has lately been adopted in Berlin, Germany. The outfit bears some resem-

houses. In these establishments it appears that the average working day is from 8 a.m. to 6 p.m., with from 30 to 45 minutes for lunch, except on Saturday, when in many stores the employees work as late as 11 p.m. This is also the case for from 10 to 14 days during the Christmas holidays, when they remain without extra compensation. In some of the smaller stores women are employed from 8 a.m. to 9 p.m. in each week day and as late as midnight on Saturday. Some of the employees also work on Sunday from 8 a.m. to noon for an extra compensation of 75 cents. Large numbers of girls are employed, from 14 to 16 years of age, at wages ranging from \$1.50 per week upward. The committee have ascertained from the testimony of employers that

Fig. 2.—Plan of Revolving Flange.

paint and boiled oil makes a substantial and durable tank. For plumbers the cast iron sectional tanks of the trade are easiest handled and satisfactory in every way. The size of the pump is of much importance in laying out a wind-mill pumping plant. If it is too large the mill will only run in the strongest winds, and its daily yield of water may be little or none. A pump for a 6 foot mill, if single acting, should not be larger than 2 inch diameter by 4 inch stroke for 50-foot lift, and $1\frac{1}{2}$ -inch diameter by 4-inch stroke if double acting. As but very few pumps of the trade are made for as short strokes as 4 inches or less, the longer stroke pumps can be used by adjusting the buckets to the lower part of the chamber to avoid too great clearance, which interferes with discharging the air from the suction pipe.

blance to the dress usually donned by divers when at work. The materials of which it is constructed are asbestos and rubber, so treated as to be absolutely fire proof and impermeable to heat. A helmet is hermetically fitted to the suit, a plate of glass, specially prepared to withstand a high temperature without cracking, being embedded in the front thereof. Air is supplied by means of a tube, as in the case of a diver. With this contrivance it is possible to enter parts of a burning building where, under ordinary circumstances, human life could not exist. The Scaphander has been in use in Berlin for some time and is said to have proved efficacious both for fire fighting and life saving purposes.

A special committee of the New York State Assembly has been recently investigating the condition of female labor in New York City. The principal field of investigation was in the large dry goods stores and mercantile

Fig. 3.—Front Elevation of Shaft Flange.

Fig. 4.—Connecting Rod and Flange Bearing.

from their standpoint there is no necessity for the employment of girls under 14 years of age, and they suggest for consideration on the part of the Legislature the enactment of a law preventing the employment of children under that age. The committee found that the sanitary conditions and arrangements of the various mercantile establishments are on the average fair, though violations of existing laws and regulations of the Health Board were discovered in some of the larger establishments. It was also found that the law requiring employers to provide seats for female employees has not been generally observed. To be of any value they recommend that this law be amended so as to make it more definite and thereby capable of enforcement. The committee's investigations are to be extended to the women employed in "sweet shops," and they state their intention of making their inquiries in this field as searching and complete as the matter demands.

PLUMBING and GAS FITTING.

Convention Hotel and Railroad Rates.

The following letter is received from John Mitchell, president of the National Association of Master Plumbers :

It is to be regretted that the Western Lines Passenger Association has not seen fit to grant a reduction in railroad fare to delegates attending the convention. Delegates west of Chicago, Peoria, Quincy, St. Louis and Cairo will have to buy regular tickets to these points and from there buy regular tickets to Philadelphia, taking certificate for same, as explained in official notice of convention. The place for holding the convention has been changed from the Chestnut Street Opera House to the Walnut Street Theater, Philadelphia. Through an error the rate at the Stratford House was given as \$2 per day. It should be \$4 to \$6 per day.

The Nelson Siphon Grease Trap.

An attachment for the kitchen sink, designed not to trap the grease but to get rid of it without clogging the waste

The Nelson Siphon Grease Trap.

pipes, is being manufactured by the N. O. Nelson Mfg. Company, St. Louis, Mo., and is shown in the accompanying illustration. It is claimed that it requires no attention in use and that it is never necessary to open it, the construction providing for automatic flushing, which thoroughly scours the trap

and sends all the accumulation of hardened grease out of the trap ahead of the water. In operation the greasy water is discharged from the sink through the waste pipe and enters the trap and ejector at the bottom through an enlarged chamber, which is covered by the funnel shaped end of the siphon. The grease, being lighter, floats on the surface of the water within the funnel, and as the body of the ejector fills with water the grease is cooled and rises in the siphon until a siphonic action is started, when the grease is forcibly discharged into the drainage system, which is thoroughly scoured by the water that flows immediately after. With frequent discharge the deposit of grease is so small that its accumulation on the inner surface of the pipes is hardly possible.

The Stewart Water Heater.

The illustration herewith shows a sectional view of the Stewart water heater, made by the Stewart Mfg. Company, 4-6 Avenue A, Newark, N. J. The heater consists of a stand and jacket. The stand is of standard height and can be used under any size of boiler and in connection with or separate from

be used as required. The heat strikes the bottom of the boiler and then passes up and around the surface of the boiler to the top, where it may be carried to a chimney or allowed to escape in the room. It is stated that 35 gallons of water can

The Stewart Water Heater.

be heated to the boiling point in two hours with a consumption of 30 feet of gas, after which it may be kept at about the same temperature with the use of 6 feet of gas per hour, allowing 3 gallons of water to be drawn every hour if required. It is claimed that 35 gallons of water hot enough for a bath can be furnished in 30 minutes. The jacket is said to conserve the heat when the boiler is used in connection with a range and water back. By running one burner it will also prevent the danger of freezing when there is no fire in the range in the winter season.

a range and water back, requiring no alterations in the plumbing work. The jacket consists of two shells, with a filling of asbestos between them, which cover the entire boiler, leaving a space of 1 inch between the boiler and the jacket. The stand has five gas burners attached to it, one or all of which can

The Vulcan Instantaneous Water Heater.

The illustration herewith shows the Vulcan instantaneous water heater, made by the Shipman Engine Manufacturing Company, Rochester, N. Y. The heater is designed to supply hot water for use where there is no coal fire or water back and boiler, and is adapted to be attached directly to the house service pipe, being constructed strong enough to withstand the pressure carried by the ordinary water works system. It is stated that it is adapted for the use of either artificial or natural gas and that a burner

from Valentine Weiner two lots across Jay street from his present location, on the corner of Fifth and Jay, for \$11,000. Mr. Trane will erect here a fine new brick building for the accommodation of his extensive stock of plumbing fixtures and his shops.

Massachusetts Plumbing Law.

The attack that is being made on the present plumbing law in the Massachusetts Legislature deserves to fail of its purpose, says a writer in a New England paper. This law requires that all cities and towns of the State

which is being fitted for their occupancy. The new concern will manufacture a special line of plumbers' goods and handle the finer grades of supplies. In addition to the well known inventions of Mr. McHugh, the new company will exploit some entirely new plumbing appliances which will be known as the Model line, notably a ball cock, wash down closet and lavatory, and a special feature of the business will be solid porcelain bathtubs and sinks. This company will also manufacture and sell the Union expansion bolt. P. J. Lynch, who will be general manager of the company, has been identified with the plumbing business for a decade, originally with Wm. H. Doyle, a prominent plumber of Philadelphia, and later with C. A. Blessing of that city, from which position he came to Boston to manage the Deeco business at 146 High street, Boston. Mr. Lynch has had wide experience at both ends of the trade, and brings to his new connection expert knowledge of sanitary appliances, practical business ability and the good will of the entire trade.

The Bray Pipe Hanger.

The illustration herewith shows a new pipe hanger put on the market by C. A. Bray, 155 Elliot street, Boston, Mass. After the shank has been secured into the ceiling the length of the hanger may be adjusted by turning the flange, which works on the lower end of the screw, enabling the hanger to be adjusted so as

The Vulcan Instantaneous Water Heater.

can be furnished for using gasoline. The gas burner is located under the heater, as shown, and furnished with a pilot light which is kept burning continuously. The main gas supply cock is connected with the water supply cock, so that when one is turned on both are opened. The temperature of the water naturally is governed by the quantity which passes through the heater, and a special cock is arranged for controlling the main so that it is possible, when desirable, to generate steam for the cleansing of bottles when used at the hotel or restaurant bar. In construction the heater has a water jacket connected with a water dome at the top, and the water to be heated passes up through a pipe in the center to the water dome and is carried from it to the water jacket by a series of pipes. The water, having become partially heated, is now raised to a higher temperature by passing from the water jacket into a coil which runs spirally to the top of the heater, and then passes into a downward flowing spiral coil to the outlet, which, after passing outside of the heater, runs up near the top of the heater and again turns down. This arrangement leaves the heater full of water, so that should the gas burner be kept in operation when the water supply is shut off the heater cannot be destroyed. The water dome and water jacket are both made of cast iron, while the heating coil is made of steel tubing, and all parts are said to be thoroughly tested previous to leaving the factory.

JAMES A. TRANE, La Crosse, Wis., the well known plumber, has purchased

of 5000 inhabitants or more shall have a board of examiners of plumbers and of inspection of plumbing, and that all plumbers who propose to engage in the business, whether as master plumbers or journeymen, shall first procure a certificate as to their qualifications for such business. This law has been in operation for two years and a higher standard of plumbing work has been secured. Under its provisions it is impossible to put in the poor material or poor workmanship that was supplied prior to the enactment of the law, and the public health and welfare have thus been protected and promoted. It is now proposed to make the acceptance of this law, in some localities, optional instead of mandatory. It ought to be apparent that such an amendment would tend to defeat the excellent purposes which this legislation was designed to accomplish.

Model Manufacturing Company.

P. J. Lynch, until very recently manager of Deeco Company's Boston branch, has associated himself with T. J. McHugh, well known in the plumbing trade as an inventor of plumbing appliances, formerly connected with Wm. H. Ward & Co., and more recently with the Sanitas Mfg. Company, also with Frank Grady, who is a practical man in the business, and will form a stock company under Massachusetts laws as the Model Mfg. Company. They have leased the four story building 128 and 130 Oliver street, Boston, Mass.,

The Bray Pipe Hanger.

to give the desired pitch to a pipe supported by it. The flange also makes a finish against the ceiling. The loop or band which secures the pipe is then attached to the stem by a pin, which has a groove in the center, enabling it to remain securely in place. It is claimed that this hanger can be quickly adjusted to the work and that the bands for the piping can be readily cut from metal strips with the Champion clamp machine manufactured by Mr. Bray. This machine is arranged with a scale showing the exact length required for a band for lead and iron pipe and brass tubing of different diameters, and will punch the necessary holes for securing the band, and will also bend the band in the proper shape.

Hudson County, N. J., Plumbers.

About 40 master plumbers from different sections of Hudson County, N. J., got together at Groeschel's Hall in Jersey City last week and organized the Master Plumbers' Association of Hudson County. These officers were elected:

Edward Moore, president.
Louis A. Menegaux, first vice-president.

Joseph Duff, second vice-president.
Charles Sulk, third vice-president.
Charles T. Miller, 126 Congress street, corner of Central avenue, secretary.
Charles H. Orriss, financial secretary.
W. J. Cross, treasurer.

Charles Wagner, sergeant-at arms.
Assemblyman Blackshaw, Messrs. Kelleher, Zumbusch, Miller, Ewald, Sulk, Coulson, Menegaux, Cross and McDonald were appointed a committee on trade and resolutions. Messrs. Steinhoff, Ewald, Renker, Breyer and Andre were appointed to draw up a constitution and by-laws. The association will meet on the second and fourth Tuesdays of each month at Groeschel's Hall. President John H. Mitchell of the National Association will address the association at an early meeting.

TRAPS AND VENTS.

J. FRANK KERTZ has removed his plumbing establishment to the building vacated by the Y. M. C. Association, 318 Warren street, Hudson, N. Y.

L. L. VICKERS will remove his plumbing shop to 12 East Main street, Salem, Ohio.

Geo. H. BURGE, Bay City, Mich., practical plumber, steam and gas fitter, has bought out the Walther plumbing establishment, located on Midland, between Catharine and Dean streets.

THE FOLLOWING were appointed as sanitary inspectors by Mayor Myers of Savannah Ga.: Northern division, W. H. Peck; southern division, Geo. W. Allen; eastern division, Alex Mendel; western division, Chas. A. Gradot. The appointments went into effect May 1 and continue until November 1, the salary being \$50 a month.

JOHN MURPHY has opened a pipe fitter's establishment on Central avenue, Dover, N. H.

TWO CANDIDATES took the journey-men plumbers' examination at Springfield, Mass., under the charge of F. W. Tower, city inspector. The examination was divided in two parts, practical and theoretical. The practical test consisted mainly in joint wiping. The candidates were asked questions on the theory and best methods of doing certain kinds of plumbing work. A standing of 75 per cent. is required to pass the examination. The Mayor and the Building Inspector are members of the examining board. The two candidates examined are graduates of the plumbing class of the Industrial School.

JOHN A. JENNINGS of the Health Department, Brooklyn, N. Y., speaking for William S. Johnston, the Sanitary Engineer, makes the following remarks on the new plumbing regulations which go into effect May 15: "The only marked difference between the rules we are now working under and the new ones is that formerly the plans and specifications for new plumbing or extraordinary repairs to old houses were submitted to the department in a rough state, while now it is

required that all such plans be drawn to scale. Hereafter, too, the plans are to be submitted by the architect, owner or builder, and not by the plumber. The object of the change is to get the plumbing of a house down to a statistical basis, so that intending purchasers when they come to make inquiries of this department will know just what the sanitary arrangements of the house are. In other words, the Charter law, requiring all alterations to plumbing of any magnitude to be approved by the Health Commissioner before being made, is now for the first time being enforced. Repairs or minor alterations do not come under the heading of the law which I, with others, deem to be of decided benefit, not only to the people, but the plumbers. All these rules before their adoption were submitted to the City Works Department, as well as to the Master Plumbers' Association, and the small modifications made in them when they were sent back were adopted."

J. B. McLAREN has left Muskegon, Mich., for Springfield, Mass., to accept a position with the P. P. Emery Mfg. Company, brass founders and copper smiths, of that city.

BEHRENS & REEK have removed their stock and plumbing shop to 1220 N. Eighth street, Sheboygan, Mich.

SUPT. W. A. EDWARDS, Coxsackie, N. Y., has his time quite fully occupied in attending to the tapping of the mains and overseeing the putting in of water nowdays. There is a constantly increasing number of water takers.

The Metal Worker is indebted to Geo. S. Bull, corresponding secretary of the Master Plumbers' Association of Hartford, Conn., for a list of officers elected at their meeting last week. The officers are: President, Edward Mahl, 666 Main street; vice-president, James F. Duffy, 124 Main street; corresponding secretary, Geo. S. Bull, 189 Main street; financial secretary, Chas. Murry, 121 Main street; recording secretary, J. hn J. Lawler, 548 Asylum street; treasurer, Edward Lawler, 160 Main street; Sergeant-at-arms, John Smith, 18 Ford street. The delegates to the national convention in June, at Philadelphia, are Edward Mahl, president, and James Ahern, ex State president.

HYGIENIC APPLIANCE COMPANY of New York City has been chartered to manufacture and sell commodos and closets; capital, \$10,000, and directors, Sherwood Gillespie, Samuel Oppenheim and U. A. Elsbeg of New York City.

THE BUSINESS of the late firm of Carl & Hall, North Tarrytown, N. Y., is now conducted by S. L. Hall, who is prepared to do plumbing, steam and gas fitting, tin, copper and sheet iron work.

THE E. STEBBINS MFG. COMPANY, Springfield, Mass., report increasing sales of their Stebbins special compression and Broughton self closing work among the plumbers of the United States and the Provinces. We understand that their lawn sprinklers, the Little Giant traveling and the Twin Comet stationary, are attracting much attention and find ready sale everywhere. All departments of the works are running full force, and there is every indication of a large year's business. C. J. Hills of Cleveland and A. S. Hills of Philadelphia have taken an interest in the company and will share with Major

Brewster the management of the company's affairs.

GEORGE D. KIMBER of Brooklyn was instantly killed last Tuesday evening by a fast express train, at Bridgeport, Conn. He started to cross the tracks and, apparently, becoming confused stepped directly in front of the train. The locomotive and entire train passed over him, cutting the body into pieces. Mr. Kimber was well known in the hardware trade in New York and Brooklyn as a wholesale dealer in plumbers' materials.

F. J. REYNOLDS, Ansonia, Conn., will attend the plumbers' convention at Philadelphia and will probably be a delegate, as he was named as an alternate at Waterbury.

FRANK E. DWYER & Co have rented the store of W. C. Mills, 8 Middle street, Gloversville, N. Y., where they will open a plumbing, steam and gas fitting establishment.

THE FOLLOWING PLUMBING ESTABLISHMENTS have recently been established in Chicago: Brill & Rosenwald, 277 Thirty-fifth street; Peier King, 1515 West Lake street; Ralder Moe, Windsor Park.

THE HENRY MCSHANE MFG. COMPANY have about finished work on their new plant at Dunkirk, Md. About 400 men will be employed, and it is expected that the works will have a melting capacity of from 75 to 100 tons of iron daily and will be in operation in about two weeks.

AT CAMBRIDGE, MASS., last Saturday a number of the inspectors of plumbing of the cities and large towns of the State met in City Hall and formed a temporary organization, with P. P. Connealy of Watertown as president and W. H. Ford of Cambridge as secretary. The meeting adjourned to meet June 8, at Worcester, when the temporary organization will be made permanent.

J. J. MURPHY has opened a plumbing establishment on Central avenue, Dover, N. H. In addition to his plumbing business he has put in a stock of stoves and ranges.

THE MASTER PLUMBERS OF TEXAS will meet in Austin on May 13 and will, among other things to be done, elect delegates to the national convention in June. Dan F. Sullivan of Dallas and his associates will strive to secure the next national convention of the master plumbers for Dallas, and say this can be done with a little effort, as that convention is expected to meet in Texas. The San Antonio plumbers are with the Dallas plumbers in this movement and doubtless, as Dallas is the first Texas candidate that has spoken, all the other master plumbers of the State will pull with them.

CHAS. J. & F. E. TAYLOR, plumbers, have moved their establishment from South Allegheny street to High street, Bellefonte, Pa.

AT A MEETING of the Board of Health of Springfield, Mass., on Tuesday, plumbers' licenses were granted to John Oimette, 354 Water street, and Ferdinand J. Gast, 582 Main street.

A. A. MORTON, a Boston dealer in plumbers' and steam fitters' supplies, was a visitor among the New York trade this week.

A HANDSOME ARRAY of brass signs may be seen on either side of the entrance at 92 Water street, with the

word Rome at the top. Beneath are the signs of R. M. Wilson, Rome, N. Y., manufacturer of plumbers' specialties, and of the Rome Mfg. Company, who make copper tea kettles, wash boilers and copper household utensils and stove fixtures. At the bottom is the name of the Rome Brass & Mfg. Company, who make curtain poles and all kinds of brass decorations for upholstery.

JOHN D. SWINTON of Swinton & Co., Port Jervis, N. Y., was a visitor among the plumbing and heating trades in New York this week.

THE BOARD OF HEALTH of New Bedford, Mass., are issuing their recently adopted plumbing regulations, in the form of a pamphlet of 16 pages, and through their courtesy a copy has been forwarded to *The Metal Worker*. The regulations require that only cast iron soil pipe shall be used in buildings; that the front wall trap shall have a fresh air inlet on the house side; that no water closet shall be flushed directly from the house service; that only porcelain lined, cast iron traps shall be used in connection with the closets, and that a plan shall be filed with the Board of Health for all alterations to plumbing systems.

A SERIOUS FIRE which occurred in the store of the Nason Manufacturing Company, 71 Beekman street, New York, on Sunday last caused some slight damage to the stock of the Haydenville Mfg. Company next door, through water and the breakage of glass. Owing to the premises of the Haydenville Mfg. Company being protected by iron shutters no actual damage by fire happened, although the concern have been put to great inconvenience through the destruction of their elevator, which worked between the two stores. The company report a very heavy demand for their specialties in steam and hot water and plumbing goods. Their factory at Haydenville, Mass., has been kept running night and day to its fullest capacity, with a force of 275 men, during the last two months, and they are still behind in their orders. The firm report that during the month of April, the volume of orders filled by the concern was larger than ever before in any month of their history. Some new lines of goods are preparing and will be placed on the market before long. The company have recently been reorganized, the following being the present officers: H. H. Beals, president and treasurer; L. H. Beals, vice-president, and R. C. Wilson, secretary. The last named has for several years represented the interests of the company on the road.

A Pittsburgh dispatch states that some large importations of colored men from Virginia, for work in the mines in place of the striking miners, have lately taken place in the Pennsylvania coal region.

A special feature of the forthcoming exhibition at Bordeaux, France, will be the largest bottle ever made. It is to be 115 feet high and divided into a number of stories, in the lowest of which there will be a restaurant. A winding staircase will lead up into the neck, in which will be situated a kiosk, taking the place of the cork, where there will be room for 35 persons to sit and observe the exhibition grounds and the city.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

WM. B. ROTHSCHILD is to build a new residence at Hartford, Conn., to cost \$8000, which will have a heating system and a fine grade of plumbing work.

FRED. LEWIS, New Haven, Conn., is to erect a new residence, in which Arnold & Co. will do the plumbing and install the hot water heating system.

THE CITY PROPERTY COMMITTEE of Rochester, N. Y., have been given authority to advertise for bids for the plumbing of the City Hall building, the work to be done under the supervision of Plumbing Inspector Smith and according to plans to be prepared by the inspector.

W. A. EDWARDS, Cocksackie, N. Y., has just completed a system of hot water heating for Hiram Brown and Dr. A. Beach, using a No. 8 Victor boiler. The trial, it is reported, showed a good circulation in all of the radiators in five minutes after the match was applied. P. C. Antonides, who has had a large experience in plumbing and heating in cities, did the fitting, and has made arrangements to remain permanently with Mr. Edwards.

THE ITHACA PLUMBING & STEAM FITTING COMPANY, Ithaca, N. Y., have the contract for plumbing work at the Cascadilla School dormitories.

BISHOP TIERNEY has awarded the contract for furnishing the steam heating apparatus for the Home for the Aged and Infirm at West Hartford, Conn., to Albert B. Franklin of Boston, his bid being \$3920.

THE CONTRACT was awarded by the school trustees to Clarke Potter of Wickford, R. I., to furnish a Victor heater connected with the coil system for \$532, for heating the school.

A. V. FETTER, La Crosse, Wis., has been awarded the contract for the heating apparatus for the High School at \$2469, and James A. Trane the Redfield Street School Building at \$3476.

THE CITY COUNCIL of Pawtucket, R. I., have passed an ordinance appropriating \$2384.75 to cover the expenses incident to changing the sanitary conditions of the Grove Street and Church Hill school houses.

THE FIRM of Cully & Lewis, plumbers, of Livingston, Mont., have secured the contract for the extension of the sewer and water mains at Port Yellowstone.

ROBERT M. JACK & SONS of Jackson, Mich., were the lowest bidders at \$21,000, and were awarded the contract for the interior finish, plumbing, &c., of the Federal Building at Columbus, Ga.

JAMES CURRAN & CO., New York, have been awarded the contract for the heating apparatus of the addition to the Government Building in New Haven. The price is \$4150.

E. W. HOLMES, Montello, Mass., has the contract for the plumbing and heating of the new Ackerman Block, on Spark street.

J. F. AHERN of D. Ahern & Son, Fond du Lac, Wis., is at Green Lake, Wis., superintending an extensive job of plumbing and putting in a gas machine in the summer residence of N. D. Thompson, the wealthy St. Louis publisher.

JOHN MARKEY, 2925 Cottage Grove avenue, Chicago, has the contract for the plumbing and drainage in the four store buildings of W. V. Nickols, 2821 to 2827 of same street.

JOHN H. SULLIVAN, 328 East Division street, Chicago, is to do the plumbing and drainage in the flat building of A. Swanson, 130 Vedder street.

FRANK J. RICH, 1204 Diversy street, Chicago, has the contract for the plumbing and drainage in the flat building of G. Fuchs, Lincoln and Graceland avenues.

THE J. F. ALLES PLUMBING COMPANY, 233 Lincoln avenue, Chicago, have the contract for the plumbing and drainage in the flat building of H. Witt, 1049 Norwood avenue.

THOMAS & ANDERSON, 118 North Centre avenue, Chicago, are to do the plumbing

and drainage in the three flat buildings of E. Berndt, Hamburg and Lepson streets, and in the store and flat building of E. Lundren, 388 Fullerton avenue.

HENRY BAUER, 232 North avenue, Chicago, has the contract for the plumbing and drainage in the flat building of E. H. Knoop, 1712 Sheridan Boulevard.

H. BREYER, Jr., 1725 Milwaukee avenue, Chicago, is to do the plumbing and drainage in the residence of M. J. Cooley, 224 Myrtle avenue.

FRANK FALK, 729 Milwaukee avenue, Chicago, is to do the plumbing and drainage in the flat building of J. C. Knutson, 269 West Chicago avenue.

CHARLES UHER, 524 West Eighteenth street, Chicago, is to do the plumbing and drainage in the apartment building of J. Kertes, Van Horn street.

THOS. O'DONNELL, 738 Seventy-ninth street, Chicago, has the contract for the plumbing and drainage in the flat building of C. L. Barton, 6454 Greenwood avenue.

R. J. KNIGHT, 806 Third-first street, Chicago, has the contract for the plumbing and drainage in the flat building of D. M. Hayes & Co., 1397 Fulton street.

THOMAS & ANDERSON, 1525 Milwaukee avenue, Chicago, are to do the plumbing and drainage in the flat building of C. Rolandsen, 777 Davis avenue.

ERNEST GARNER, 1740 Milwaukee avenue, Chicago, has the contract for the plumbing and drainage in the residence of W. L. Johnson, 223 Laurel avenue.

THE CONTRACT for building the Albert Lea Opera House at Minneapolis, Minn., has been awarded without the heating and lighting contracts.

THE BRIDGEPORT STEAM HEATING COMPANY, Bridgeport, Conn., have secured the contract for placing a Gurney hot water heating system in the residence of Charles Judson, Stratford.

E. A. VALQUETTE, practical plumber and dealer in supplies, Rutland, Vt., will do the plumbing and put in the heating outfit for the new addition to the Berwick House, that city, which will include extensive baths.

Experiments with Sheet Aluminum.

Crosier, Stephens & Co. of Newcastle-on-Tyne, England, have lately made some interesting experiments with sheet aluminum, weighing 97 grams per square foot, the results of which are tabulated in the London *Ironmonger*. In all these experiments the aluminum sheets were immersed in the liquid named for the time specified, and were then carefully cleansed and reweighed. The loss of weight is, for the sake of comparison, stated upon 1 square foot of surface:

	Number of days.	Loss in grams.
Distilled water.....	15	nil
Water supplied by company.....	15	0.0000
Solution of salt, 2 per cent.....	15	0.0450
Infusion of:		
Tea.....	15	9.6270
Coffee.....	7	0.0270
Cocoa.....	15	0.0390
Draft ale.....	7	nil
Draft porter.....	7	0.0360
Solution of:		
Citric acid, 1 per cent.....	7	0.0450
Tartaric acid, 1 per cent.....	7	0.0720
Oxalic acid, 1 per cent.....	7	0.3690
Borax.....	28	0.006
Olive oil.....	28	nil
Bottled cider.....	29	0.009
Milk.....	29	0.009
Golden syrup.....	23	nil
Cognac.....	23	0.081
Demarara rum.....	23	0.089
Irish whisky.....	23	0.045
London gin.....	23	nil
Port.....	23	0.099
Sherry.....	23	0.189
Curc.....	23	0.027
Hock.....	23	0.045
Aerated waters.....	23	nil

Among the captures made by the Japanese troops at Port Arthur were the rails for the construction of 120 miles of the Tientsin and Moukden Railway.

ROOFING AND CORNICE.

Combination of Vermont Slate Manufacturers.

The condition of affairs in the Vermont roofing slate trade has been for some time far from satisfactory. Since the dissolution of the old combination of manufacturers prices have become more and more demoralized, until lately quarrying is said to have yielded little or no profit to the operators. To remedy this evil a new combination was effected last week, which, with one exception, embraces all the Vermont slate concerns, some 25 in number. The association was organized under the name of the Vermont Slate Company, with main office at Granville, N. Y. A secretary and manager was appointed and a board of directors elected. The combination, it is declared, is not formed for the purpose of obtaining high prices, but solely to secure stability and regularity in prices, so that roofers throughout the country may know exactly what they will be required to pay for sea green roofing slate. A new list of prices was drawn up and unanimously agreed to, which, while somewhat higher than the cut rates lately in vogue, is substantially lower than the scale ruling at the close of 1893. According to the agreement, subscribed to by the members, all business must be done through the main office, where all orders received by the several concerns will be periodically filed, and the central office will apporportion the production.

The outside business is limited to four wholesale dealers, who will represent the combination. They are John Galt & Sons of New York City, David Smith and Gilbert Snyder of Zanesville, Ohio, and J. M. Hochstetter of Sugar Creek, Ohio.

The new arrangement is said to have given great satisfaction to the trade and a good business is looked for in the coming month. All the Vermont quarries are in full operation, with a growing and improving volume of output. Export business of a very encouraging character is being done with Australia, South Africa and the British West Indies.

PEDEN & Co., dealers in roofing material of all kinds, Houston, Texas, made announcement under date of April 30 that they had decided to concentrate their entire business at Houston and would not carry any stock in Fort Worth after May 1. Their Houston stock will on this account be larger and more complete than ever before, so that they will be able to supply all orders promptly. They mention that their facilities for

shipping are most excellent, and they appeal particularly to the trade in North Texas. Their location in Houston is 1013 Franklin avenue.

Foot Power Curved Molding Machine.

J. M. Robinson & Co., Cincinnati, Ohio, have put on the market a foot power curved molding machine, a gen-

give to the hammer the desired movement. To the body of the machine immediately under the hammer the die chuck is secured, in which the three dies are fitted and held in position by means of clamps operated by hand wheels, shown in the illustration. The bottom ends of the dies are fitted into the adjustable jaws of the chuck, and are adjusted by means of screws to suit the formation of large or small circular

Foot Power Curved Molding Machine.

eral view of which is illustrated in the accompanying cut. The sheet metal molding seen in the foreground shows the product of the foot power machine, the engraving having been made from a photograph. The body of the machine, it will be noticed, is in one casting, giving, it is pointed out, strength and solidity. The hammer is fitted to and operated between gibbed slides secured to the upper projecting portion of the body and operated by means of connections to the foot treadle, on which an alternating pressure of the foot will

moldings. The top die is secured to the face of the hammer by means of slide clamps. The gauges in the rear of the bottom dies are adjustable, to suit the widths of the sheets being formed. In operating the machine a downward pressure of the foot on the treadle causes the hammer to strike a downward blow. On releasing the foot pressure, and without removing the foot, the hammer will rise by means of a spring acting on the hammer handle between the treadle attachment to the handle and the fulcrum, to which the rear end of

the handle is attached by means of a pin on which it rocks in the reciprocating vertical movement of the hammer. The power of the spring can be increased or diminished by means of a set screw immediately under the spring pocket. The set screw is provided with a lock nut so as to prevent movement

J. M. Robinson & Co. manufacture a similar power curved molding machine. The frame is likewise in one piece, the motion being communicated from a driving shaft and the striking power of the hammer regulated by foot pressure on a treadle. The weight of this machine is 1500 pounds.

Different Moldings Made with One Set of Dies.

while the hammer is in motion. The alternating foot pressure on the treadle with the action of the spring gives the required motion to the hammer. The speed and striking power are governed by the slow or quick movement of the alternating foot pressure on the treadle, which is located near the base of the machine at the front. In forming up sheet metal molding the sheets are first cut to the proper shape and size. They are then placed against and guided

From the instructions for operating these curved molding machines published by J. M. Robinson & Co. we quote the following, which will be of interest, together with illustrations of the use of the machine.

The principal features of the curved molding machine are the hammer, chuck and dies. The dies are made of cast iron, the surface of which is of a suitable shape to correspond to the molding to be formed, and the

the circular form to the molding. The center die is rigid, while the other dies, one on each side, are pivoted to and turn on the center die. The hex-head screws, two of which are on each side of the chuck on the ends of which are nuts, interlocking with base of die holders, and by movement of the hex-head screws in either direction will cause the die holders to move as required, thus changing the position of the die on either side of the center die and giving the required curve to the mold in process of forming. Movement of the hex-head screws will cause the top surface of dies to move in one direction and the bottom in an opposite direction, thus increasing or decreasing the circle of the mold. The nearer the three chuck dies stand to a perpendicular line the larger will be the circle; in fact will be very near straight when dies are perpendicular. Six dies constitute a set, four of which are used at one time; the remaining two are used for changing the shape of moldings; thus, by taking the dies out of chuck and hammer, place one die from chuck in hammer, the other two, with one from hammer, place in chuck, thus producing the changes, as illustrated in Figs. 1, 2, 3 and 4. We furnish with each machine five sets of dies, or 30 in all, with which all changes can be made that will produce 20 different kinds of moldings, embracing about all in general use.

In Figs. 1, 2, 3 and 4 are illustrated the sectional part of the curved molding machine in which the dies are secured, as well as four different moldings made with the one set of dies changed as shown in the illustration. The position of the dies in Fig. 1 produces the molding shown between the dies. Molding B is formed with the same dies changed around as shown in Fig. 2. The molding A is formed with the same dies as shown in Fig. 4. Fig. 3 exhibits another molding formed with the same dies changed as illustrated. With the illustrations and explanations it will be seen how four different kinds of moldings are made with one set of dies. The accompanying illustration shows six different kinds of moldings, all of which have been produced with a foot power curved molding machine. As will be observed, there are six moldings, lettered A, B, C, D, E and F, each of which presents a different figure and are marked with the word "Seam," thus showing each section of the molding to be made on the machine, then joined at the word seam, thus completing the figures as per above illustrations. Figures, indicated by numerals 1, 2, 3, 4 and 5, illustrate the dies with which to form Figs. A to F in sections, as noted by the word seam. Figs. E and F are formed with Nos. 3, 4 and 1 dies. Figs. C and D with Nos. 1 and 2. C (2 size) with No. 1. Figs. A and B are formed with Nos. 1 and 5 dies. We find it a difficult matter to draw larger than a 2½-inch round; this can be done on large sweeps.

The 2 inch can be drawn as small as 30 inch diameter. If a larger one-half round is desired then use two one-quarter rounds and seam them as shown in D and E; by this method any size circle desired can be formed, provided the dies are of the size required; if not, then make a set of hardwood dies.

The best plan to make the one-half round—so we are informed by an expert—is to form the piece on a corncob brake first, then draw it gradually until the required radii or circle is obtained. For forming leaves and other ornaments on our curved molding machine, first procure a sample of such ornament,

Illustration of Six Different Moldings.

along the gauges, and slow and light blows struck with the hammer for the first passage of the sheet over the dies. This makes a slight indentation, which will serve as a guide and enable the operator to hold the sheets in place, when the blows of the hammer may be increased as the operator may think best. The shipping weight of the foot power curved molding machine is 900 pounds.

dies are secured to the die holders by means of a projection on the base inserted into a counterpart of the same in the top surface of the die holders. There are three dies in the chuck. The center die, together with a die of the same kind secured to the hammer and with the action of the hammer, forms the molding. The die on each side of the center die is adjusted with a circular movement, and with the action of the hammer gives

from which make a plaster of paris mold and back it with wood, thus forming a pattern from which to make a cast iron die, which will do for a bottom die. To obtain a top die, cast to bottom die; composition, nine parts block tin, one of lead and one of antimony, or all zinc will do when there is not much use for such dies, with backing so as to clamp in hammer.

Tinsmithing, Roofing and Cornice Class.

Last year it was the intention of the trustees of the New York Trades School to start a class in tinsmithing, roofing and cornice work. All arrangements were completed to this end, but the class was not started owing to a lack of applications for instruction. This is to be regretted, as the preparation to work in all trades that have been taught at the school has proven highly valuable to those who have attended the school. It is suggested that the class might prove more successful and accessible if it was started as a night class. This would be an advantage to young men in the immediate vicinity of New York City, but to a large extent would prevent young men from a distance securing the benefit which may be looked for in attending a course of instruction at this institution.

It is the intention of the management not only to give instruction in the manipulation of the tools and in the shaping of the metals, but to give instruction also in the cutting of patterns and in the laying out of all of the work that would naturally come up in the trade. Already the demand for cornice makers who can draw patterns and lay out work exceeds the supply, and the young man who receives his certificate after a course of instruction in this class will have made a long step in the right direction, although it is improbable that he would be capable of filling so responsible a position as the pattern cutter in a cornice shop. The opportunities for young men to get such information in the average shop are very rare, as the methods of modern trade do not warrant the employer spending any considerable time in the instruction of his young workmen, and those who succeed in acquiring proficiency do so as a result of their personal energy rather than as a result of the instruction which they receive.

It is to be hoped that those who look forward to following the cornice business will show their interest in this class to such an extent as to warrant its being started with a large number of applicants at the opening of the next school year. Information as to the work of the school can be gained by procuring a copy of the next issue of the Trades School catalogue by filing a request for one by addressing the New York Trades School at Sixty-seventh street and First avenue, New York.

The Niagara Cross Lock Seamer.

We present in the accompanying illustration a general view of the Niagara cross lock seamer, manufactured by the Niagara Stamping & Tool Company, Buffalo, N. Y. The machine is intended for fastening together sheets of tin and rolling them up in strips ready to lay on a roof. It is described as simple, rapid and easy to operate and saving in time and labor. The seamer is constructed with a view to strength and rigidity. The pressure bar is operated by a toggle movement connected with a foot treadle and the seam produced at one depression of the treadle is said to be perfectly tight and uniform the entire length. Side gauges are provided on a drop table and the sheet is held in proper position between

orandum pad, the same size as the calendar pad, occupying the center of the sheet, while at the side is a ruled column for a telephone index. A list of references contains the names of many important buildings in Providence, Newport, Pawtucket and other cities which have been roofed by Mr. Murphy. His principal business is slate roof contracting, but he also does fine sanitary plumbing, steam and gas fitting, &c.

THE CORTRIGHT METAL ROOFING COMPANY have removed their main office and factory from Broad and Hamilton streets, Philadelphia, to a larger and more modern building located at Twenty-third and Filbert streets, Philadelphia, where better manufacturing and shipping facilities are offered for supplying the increased demand for their well-known metal slates, Victoria

The Niagara Cross Lock Seamer.

the bar and bed by means of hinged fingers fastened to the pressure bar. These fingers move out of the way automatically when the bar is being depressed and drop down again when the bar goes up. An eccentric attachment is applied to the pressing bar to raise it sufficiently to allow the folded edge of the first sheet to pass through. The reel in the rear of the machine is controlled by a ratchet and pawl, and when the rolls are seamed, it is mentioned, can be removed without difficulty. The table is hinged to the frame, supported by brackets, and can be easily dropped down so as to occupy the least possible space. The working length is 28 inches.

FLASHINGS.

THE CALENDAR distributed by William M. Murphy, successor to Deslauriers & Co., 251 Eddy street, Providence, R. I., has some particularly serviceable features. The calendar is mounted on a large card, 11 x 14 inches in size, and carries at the bottom a calendar pad giving the days of the month. Alongside of it is printed a calendar for the year 1896. A special feature is a mem-

shingles, &c. Customers of the company and all others interested in roofing material are requested to note the change in address and are especially invited to send for their new 1895 catalogue. The Western office of the company will continue at 184 Van Buren street, Chicago, Ill.

THE LARGE CONTRACT for roofing the new plant of the Sessions Foundry Company, Bristol, has been given to F. H. Sneath of Farmington, Conn., the well known slate and tile roofer. This job will require no less than 450 tons of slate.

THE SLATE TRADE in the Bangor (Pa.) region is reported to be in a very flourishing condition, with the new association working harmoniously. The demand is keeping steady pace with the production and no stock is being piled up. The outlook is regarded as very encouraging.

THE KANSAS CITY METAL ROOFING & CORRUGATING COMPANY, Kansas City, Mo., have completed the work of removing from their old quarters, and are now located at 416 Delaware street, where they have increased facilities for

handling their business. They carry a heavy and well assorted stock of all kinds of roofing, siding and ceiling material, galvanized eave trough and conductor, roof cresting, building paper, &c. They have decorated their office with a highly ornamental steel ceiling and side wall, the general effect being extremely handsome, and is an indication of what can be done in this direction. Jerome Twitchell, president and general manager of this concern, is entitled to much credit for introducing this class of work in the West. The company extend a cordial invitation to all their friends to call and inspect their work.

THE BROWN & HARRY IRON COMPANY, successors to the E. K. Dillingham Iron Company, Houston, Texas, are sending out illustrated catalogues describing the work which they manufacture and handle. The publication shows leader pipes, miters, gutters, eave trough, ridges, conductor hooks, cresting blocks, finials, cornices, corrugated iron and other goods of interest to the roofing and cornice trade. Brief descriptions and prices are given in all cases. We learn from the Brown & Harry Iron Company that business in their section of the country is very promising, present trade being better than usual and the prospects flattering for another enormous crop throughout Texas, which they say means a big business in the fall. The announcement of the change of name was made under date of May 1, and it is stated that there will be no change in the management of the business. They mention that they are constantly enlarging their facilities for manufacturing their goods and are prepared to meet competition from any source.

SCRAP.

N. & G. TAYLOR COMPANY, tin plate manufacturers of Philadelphia, advise us that they have given up their old quarters in Water street, New York City, and have moved to the Cable Building, 621 Broadway, where they have opened new and commodious offices with a corps of assistants in charge of George Livingston, who has long been identified with the building and kindred trades of New York and Brooklyn, and who was for many years a member of the Building Commission of the Board of Education of New York. The firm also announce that they have secured larger and better warehouse facilities for the quick filling of orders. Consumers wanting the special brands of tin plate manufactured by this firm can secure prompt attention by communicating with their office at the address given.

THE AMERICAN TIN PLATE COMPANY, Elwood, Ind., turned out in April a larger amount of stock than they have ever before produced during any one month in the history of the concern. Work on five new tin mills will shortly begin. The added facilities will give an increased capacity of about 4000 boxes of tin plate weekly.

THE IRONDALE STEEL & IRON COMPANY, manufacturers of tin andterne plate, Middletown, Ind., increased their working force last week from 250 to 400 men. The two new tin mills built by this concern have been put into operation.

WM. STICKTON, who has for the past eight years represented the interests of the iron and steel firm of Singer,

Nimick & Co., Ltd., of Pittsburgh, at Chicago, now proposes to give his entire attention to the business in that city of the Falcon Iron & Nail Company of Niles, Ohio, manufacturers of black and galvanized sheets, tin plate, &c.

SPEIDEL & REPER, Reading, Pa., manufacturers of Speidel's economic safety hoist, have recently supplied eight of these appliances, of 4000 pounds capacity each, to the Beaver Tin Plate Company, Lisbon, Ohio; one of 30,000 pounds to the Ohio River Sheet & Tin Plate Company, Remington Station, Pa., and two of 2000 pounds to the Conshohocken Galvanizing Company, Conshohocken, Pa. The Speidel hoists have been used for years in the galvanizing and annealing departments of a number of the leading works of the country.

THE LATEST ADVICES from England indicate that more than half the number of Welsh tin plate mills are still idle, and that the orders now being booked are only sufficient to keep the working mills going from hand to mouth. The orders in hand are said to be principally for odd sizes and small quantities. The prospects are regarded as anything but cheering and a further stoppage of works is contemplated.

THE TIN PLATE WORKS of the Licking Rolling Mill Company, Inc., Covington, Ky., have been in operation for the past month, making a fine quality of tin andterne plate. The concern have in operation one tin mill and are turning out 7 1/2 tons of black sheets daily, which they use in the manufacture of finished plates. Two more mills are building. They have at present two tinning sets, and propose, as their trade increases, adding materially to their capacity. The brands produced at present are: J. D. L., a bright charcoal plate; Cin'ti, a coke tin, and Licking, aterne plate. The officers of the concern are I. Droege, president; F. J. Droege, vice-president; John C. Droege, treasurer, and B. Macke, secretary.

CONSIDERABLE dissatisfaction is said to exist in the Welsh tin plate market in regard to the new Board of Control which has been established in South Wales to restrict the making of tin plates, and, by limited production, to endeavor to raise prices. It is asserted that comparatively few firms have given in their adhesion to the body, and it is freely predicted that the board will not last out the year. Internecine strife among the Welsh manufacturers appears to have as much to do with the present demoralization of the British tin plate market as the shrinkage in demand from the United States. English trade journals are unanimous in recommending that employers and employed should make every endeavor to arrive at some suitable basis of understanding so that they may present a united front, and in this manner push their trade. This is regarded as the only way out of the present depression.

THE NEW PLANT of the Beaver Tin Plate Company, Lisbon, Ohio, is now in full operation, and the quality of the product is all that could be desired. This concern have a very complete plant, containing all modern equipments. C. W. Bray is president and S. M. Scott, secretary and treasurer.

THE REPORT that the Monongahela Tin Plate Company, Pittsburgh, Pa., have placed an order for a large pickling machine with the Anderson Foundry and Machine Company of Ander-

son, Ind., is untrue. The order has been placed with the Leechburg Foundry and Machine Company of Pittsburgh and is for a second Meets pickling machine, the first one having been furnished some months since, when the plant of the Monongahela Tin Plate Company was first put in operation. The additional pickling machine has been made necessary by reason of the increased output of black plates. The Leechburg Foundry & Machine Company have also secured an order for a 24-inch hot mill to be furnished to the Ellwood Tin Plate Company, Ellwood City, Pa. This new mill is to replace an old and lighter one.

THE MONONGAHELA TIN PLATE COMPANY, Pittsburgh, Pa., are nearly ready for work in their new departments, in which about 100 women will be employed in pickling the plates and polishing the sheets.

MEMORANDA.

J. H. MULHOLLAND, 80 Elm street, New York, makes a specialty of bass, coir, rattan and steel wire brushes. These are made up as stable brushes and deck scrubbers, brushes for cleaning castings and a number of different styles of brushes for cleaning the flues in steam boilers. He also makes a line of steel wire brushes such as are used by chimney sweeps.

S. I. BRIGGS, formerly of Cedar Springs, has opened a hardware store at Stanton, Mich., where he will carry a full stock of hardware, tinware, cutlery, paints and oils, and conduct a tin shop in connection with the business.

THE FIRM of Sayre & Shafer at Montrose, Pa., have dissolved. C. R. Sayre will continue the manufacture of furnaces and steam generators. N. H. Shafer has opened a new store and will deal in shelf hardware, novelties, carpenters' tools, cutlery, tinware, and wood and willow ware.

THE ILLINOIS PURE ALUMINUM COMPANY, Lemont, Ill., issue a catalogue of 54 pages illustrating their pure aluminum cooking utensils. In addition to aluminum stamped cups, milk pans, wash bowls, &c., illustrations are given of spun tea and coffee pots, tea kettles and water pitchers; also of afternoon tea kettles, chafing dishes, forks, spoons, butter plates, tea strainers, &c. The comprehensive nature of the catalogue indicates the remarkable growth of three years' business in the making of aluminum cooking utensils.

L. A. GENDRON & Co., Warren, Mass., issue circulars relating to Gendron's chimney thimble, which is described as so constructed as to overcome all chimney thimble difficulties, such as bulging of plastering, water entering the room, and is a sure preventive against fire.

The following instance of the great dissolving power of sulphuric acid is mentioned by the Engineer of London as having recently occurred in the chemical factories at Mulhouse, Alsace: An operative was blown up into the air and fell into a trough filled about 3 feet deep with sulphuric acid, the temperature of which was found to be 91° C. ten hours after the accident. The death of the man was only proved by the discovery of his carotidous respirator, muzzle, two porcelain buttons and other insoluble articles. Everything else had chemically combined with the acid.

STEAM AND HOT WATER.

The National Temperature Regulator.

The Short-Conrad Company of Cleveland, Ohio, are placing on the market a device for automatically controlling the draft and temperature in a heating system, which they call the National temperature regulator. A thermostat is placed in some portion of the building and set to operate at a given temperature. The thermostat is connected with the valve arrangement shown in the illustration herewith, being connected to the end of the lever marked A. This device may be fastened to the ceiling of the cellar by means of screws through its flanges. The motive power in operating the valve and diaphragm is water, secured by connection with the water service in the building at the point marked "Inlet" on the cut.

lators are adapted for use in connection with any of the systems of heating now in popular use. —

The Proper Location of Radiators.

From H. H., Boston.—I have noticed an article in *The Metal Worker*, April 20, written by W. H. Pennell, Washington, D. C., on the proper location of radiators, with which I differ. Mr. Pennell says that if the radiator were fixed on the opposite side of the room from the window the warm air would ascend to the ceiling and travel to the sides of the room or walls, but more especially toward the window, and fall down past the transparent surface to the floor and warm that part of the room and thus make the whole room

windows, ventilators, chimney flues or fire places, recesses, &c., also the location of the rooms relative to the building, whether northeast or southwest, or otherwise.

The warm air in a room does not confine itself to specific currents which circulate in one systematic, graceful and majestic movement, as our friend describes. Warm air is light and is easily displaced or chilled. All have seen the small particles floating in the air in a room when the sun's rays are on it, and according to the movements of any person or object in a room we see the small particles which are in the air changing their movements. The sun shining in a room is a good teacher on the circulation of air. We cannot see the air, but we can see the small bodies which are carried with it in its movements. A lighted candle is also a good

The National Temperature Regulator.

When not operated by the thermostat the weight A on the lever shuts off the inflow of water. When the temperature in the room falls a contraction of the thermostatic bar raises the plunger B, allowing the water to enter the valve. This depresses the plunger C and closes the exhaust or outlet, compelling the water to pass through the pipe D to the diaphragm. This expands the diaphragm and depresses the lever arm E, simultaneously opening the draft door and closing the check damper. As soon as an increase in temperature is shown at the thermostat a reversal of the operation begins. The weight F expels the water from the diaphragm, passing it back through valve C to the exhaust pipe, which permits the closing of the draft door and the opening of the check damper. The operation requires but half a tumbler of water. It is stated that the valve must be located directly under the thermostat, but that the diaphragm may be placed wherever the heater is located and connected with the valve by the $\frac{1}{2}$ inch iron pipe. Between the valve and the diaphragm a $\frac{1}{2}$ inch exhaust pipe must be connected. By a slight change of details the regu-

comfortable. This is Mr. Pennell's main contention. I would like to ask him if there are not conditions on which depends such a specific systematic movement of warm air in a room as he describes? I think that if a room in which a hot radiator was placed were made absolutely air tight the movement of warm air would be more likely to favor our friend's theory, because then there would be what we may call a hot air apparatus at work in that room. The hot air would rise from the radiator and the cold air fall from other parts of the room, and the coldest place in the room would be the window, which would act as a condenser, similar to a condenser to a steam engine, and give or supply something which has been displaced by heat. This I would call a systematic movement, but if an absolutely air tight room be the condition on which depends the heating of a room when the radiator is placed on the opposite side of a room from the window, why, then, I think people do not want such a condition.

Mr. Pennell seems to ignore the varied conditions on which depends the proper location of a radiator, such as doors,

teacher. By placing it on a table or on the floor in different parts of the room you see by the movement of the flame that there is a current of air and you will find out where the strongest current of cold air is coming from, or, in other words, from whence it cometh, but you will not so easily find out whither it goeth. Therefore the sun's rays and a lighted candle satisfy us that there are cross currents in a room, and so long as there are people living in a room and moving about there will always be cross currents of air. We never can fully stop the cross currents, but we can counteract the chilling effects of the rushing cold currents coming through the crevices of window frames. Now I come to my own main point of contention in differing from Mr. Pennell—namely, that the proper location for a radiator is either under a window, nearby a window or between doorways.

All have seen a fine spray from a fountain which ascends into the air several feet high, and if undisturbed by the wind the spray ascends in a perpendicular and graceful form, but when a gust of wind comes we then see

the fine spray of water driven before the wind. Another illustration is a fine spray of steam from a steam pipe blown in any direction with the wind and carried some distance before it is condensed. I think these illustrations will prove my point. I mean to say that when a radiator is located under a window, or nearby a window, or between doorways, that the influx of cold air from the crevices of the window frames, or from any other inlet in close proximity to the radiator, will carry or drive the warm air generated by the radiator right into the room and that the radiator will act after the fashion of a hot air furnace, which receives cold air and sends forth warm air, and by this action or movement the warm air will be more efficiently circulated and make the room more comfortable.

Heating Greenhouses by Gas.

In an English journal Thos. Fletcher, the well-known engineer, gives the following information of heating greenhouses with gas as a fuel:

Many conflicting statements have been made as to the cost of this method of heating, none of these giving the exact duty obtained. With the object of setting the matter in such a form that there need be no future doubt or discussion a series of exact observations have been made with every possible care, the results being as follows:

Date,	Mean outside temperature, Degrees.	Mean inside temperature, Degrees.	Rise, Degrees.	Gas consumed Cubic feet.	Gas per hour, Cubic feet.
Jan. 4 to 10...	26	49	23	2,630	153.4
Jan. 11 to 17...	44	54	10	1,670	81.6
Jan. 18 to 24...	38	52	14	1,580	93.4
Jan. 25 to 31...	36	54	18	1,570	91.5
Feb. 1 to 7...	43	55	12	1,380	84
Feb. 8 to 14...	37	55	18	1,470	88.3
Feb. 15 to 21...	35	51	19	1,540	91.6
Feb. 22 to 28...	39	55	16	1,160	71.6

The house is a lean-to, 16 feet by 10 feet, 12 feet high at back, 6 feet at front. Total area of glass, 380 square feet, including wood framing.

It will be noticed, in calculating out each of the above separately, the gas consumption varies, this difference being caused by the varying force of the wind.

Although the figures given are only to the end of February, they have been continued since; but as the sun heat makes the records so irregular they have been discarded. Taking the average results for the eight complete weeks, it will be found that for every 100 square feet of glass a gas consumption of 1 cubic foot per hour will give a rise of exactly $4\frac{1}{2}$ ° F., or 1° F. rise of temperature for every cubic foot per hour consumed in a house having 450 square feet of glass exposed, a rule which, from the care which has been taken to obtain absolute precision, may be relied on. As the main wall is part of a dwelling house, the loss on this side wall needs no consideration. An attempt has been made to take the night averages only after February 28, but the interference by accumulated sun heat during the day has caused sufficient variation to prevent the results being absolutely reliable, although they correspond fairly with the results recorded. As previous experiments have proved, at least nine tenths of the heat is lost through the glass, and the cubic contents of the building needs no con-

sideration. The brick work round is 3 feet high, being in the usual proportion, and the loss of heat through the bricks is allowed for in calculating the glass area.

Position, protection from winds and other interfering conditions will, of course, affect the results, but the above may, I think, be taken as an average standard for calculation.

The average mean temperatures for each month may be obtained from the gardening periodicals or from any physical atlas, and the actual cost of heating any plant house by gas can easily be calculated from the data given.

The Convention of the Master Steam and Hot Water Fitters' Association.

We print below the call to the convention of the Master Steam and Hot Water Fitters' Association of the United States, to be held in Philadelphia, June 13, 14 and 15, which is being sent to the steamfitters throughout the country, bearing the following signatures:

Charles J. Gillis,
Samuel I. Pope,
Albert B. Franklin,
P. S. Hudson,
E. Rutzler,

Advisory Council.

J. Leland Wells,
Arthur C. Walworth,
William P. Thompson,
James Curran,
John W. Dornforth,

Executive Committee.

Approved: Harrie D. Crane, *President.*
Edward P. Bates,
Vice President at Large.

The seventh annual convention of the Master Steam and Hot Water Fitters' Association of the United States, which convenes at the Continental Hotel, in Philadelphia, on June 13 next, will be by far the most important in the annals of the organization.

What our association has or has not accomplished, its victories and defeats, its advances and retreats, are matters of the past and need not be detailed here. We must act now in the living present if we would reap rewards in the future.

For years a handful of loyal and self sacrificing men have kept this organization together, encouraged by the hope that, sooner or later, their efforts would be crowned with success, and our business be placed on a satisfactory and living basis.

Plan after plan has been faithfully tried, method after method has been adopted, only to be abandoned as unequal to the emergency, until it seems as though there was no way out of the woods, and that all the money, energy and time so freely given had been expended for naught.

But as a ship is stripped of all useless hamper both aloft and aloft when going into decisive action, so those in charge of our association affairs, some months since, determined to cast aside all other questions and fight it out under the one flag of protection; protection from without and within, for one and all alike, from the humblest master fitter, whose yearly profit barely suffices for his own and his family's support, to the largest manufacturer, whose surplus can be reckoned by the tens of thousands.

This was, indeed, a radical departure, and one which was fraught with uncertainty and danger. How it has suc-

ceeded thus far, how master fitters and manufacturers alike have welcomed it as a happy solution of a vexed question, is a matter of record, but the fight is not yet over nor the victory yet won.

There is no important movement but what has its opponents, no reform but what must combat cavers and obstructionists; but knowing that we have the great bulk of the fair minded men in all branches of the trade with us we are not fearful of the ultimate results.

But to hasten the day of triumph we must have the countenance and support of all reputable master fitters, wherever dispersed, that, by the weight of numbers, by the power of universal influence, we may make assurance doubly sure.

To this end we earnestly request you to attend our convention, whether you are a member or not, to take part in or watch our debate, to lend your presence and counsel, to stand up and be counted "one."

Remember, this is not a delegate convention; you need represent no one but yourself, nor will you be bound by the action of any caucus or committee; it is a free and open meeting of the constructing master steam, hot water and wrought iron pipe fitters of the United States, with but one object in view, the elevation and betterment of the craft, and how best to help ourselves, each other and those who help us.

Arrangements have been made with all trunk lines for reduced fares. The hotel accommodations are of the best and at most reasonable rates, and your presence at the convention does not bind you to membership unless you so elect.

Will you come and join with us in this work, and assist us in advancing the mechanical, social and financial standing of our business and trade?

HEATING NOTES.

"THE POSTAL TRAVELER" last sent out from the United States Hester Company of Detroit mentions that they are moving their Detroit office to their new factory at Campbelt and Lauderdale avenues. They also refer to their Chicago office at 39 Dearborn street, and also state that their New York office is changed around a little, but is at the same location.

AT THE ANNUAL MEETING of the stockholder of the Vanderman Plumbing & Heating Company, Willimantic, Conn., the old board of directors, consisting of A. T. Fowler, Dennis Shea, E. L. Vanderman and John Reilly, were re-elected. At a meeting of the directors A. T. Fowler was elected president; Dennis Shea, vice president; William Vanderman, treasurer and general manager, and John Reilly, secretary. A dividend of 6 per cent was declared and the capital stock was increased to \$30,000.

THE SMITH & WINCHESTER COMPANY, Boston and New York, are issuing a budget of printed matter giving testimonials of their Winchester steam and hot water apparatus. In one testimonial it is stated that it took just 30 minutes by the watch to put the heater together ready for connection with the system of mains.

THE ANNUAL MEETING of the stockholders of the United States Radiator Company was held at the company's office, Dunkirk, N. Y., May 1, at which time the following officers and directors were elected: President and treasurer, R. J. Grees; vice president, C. D.

Murray; secretary, W. D. Moore; superintendent, J. A. Field; directors, Henry Flinck, E. R. Gifford, R. Rathbun, W. P. Smith, G. K. Fullagar.

JOSEPH BOND of the American Radiator Company has returned to Chicago after an absence of three months in Europe.

THE UNITED STATES HEATER COMPANY have moved their Chicago office and salesroom to more commodious quarters at 39 Dearborn street.

THE Chicago office and salesroom of the Kewanee Boiler Company have been moved to 54 Dearborn street.

W. K. PIERCE, president of the American Boiler Company, is spending a few days at the Chicago office.

THE KEWANEE BOILER COMPANY, Kewanee, Ill., manufacturers of the improved Hixton and Tabasco boilers for steam or hot water heating, have removed from 96 Lake street to more spacious quarters at 54 Dearborn street.

W. H. HILL of the American Radiator Company returned to the New York office this week after a visit to his old home in Detroit.

THE AMERICAN RADIATOR COMPANY, 92 Center street, New York, will furnish 550 radiators for heating the American Surety Building, New York City.

THE AMERICAN BOILER COMPANY, 94 Center street, New York, have received a very handsome medal and diploma for their exhibit of boilers at the exposition at Antwerp. The diploma will be handsomely framed and displayed in their sample rooms.

GILLIS & GEOGHEGHAN have comfortably arranged offices, shop and shipping rooms at 188 Worcester street, New York. They are occupying three floors of the building, which is 50 x 100 feet, while a building is being erected specially adapted to their requirements on the site of the building which they previously occupied and which was destroyed by fire. The new building is being as rapidly completed as is possible in view of the special features of its construction. They have made arrangements and are now turning out work and completing contracts as promptly as if they had not met with great inconvenience through the fire.

C. F. HAUES of the New York office of the Richmond Stove Company of Norwich, Conn., is entertaining J. P. Gullivan of the Norwich engineering corps while he is assisting him in some special work. N. J. Ryer is now traveling on the road in the interests of the Richmond and Victor boilers, with headquarters at 85 Centre street, New York.

T. J. DOUGLAS, well known to the customers of the Richmond Stove Company, has entered into partnership with B. Duggan under the firm name of Duggan & Douglas at 297-299 Lake street, Chicago, where they have the Western agency for the line of goods manufactured by the Richmond Stove Company of Norwich, Conn.

JOHN A. SCOLLAY, 74 Myrtle avenue, Brooklyn, is installing three of his large size new invincible boilers in the residences of different customers in Brooklyn.

THE ARMSTRONG MFG. COMPANY, Bridgeport, Conn., are making a fine display of their plumbers' and steamfitters' specialties in the show window

of their New York office at 139 Centre street. Pipe cutters and pipe wrenches of different sizes are suspended attractively in the upper part of the window, while pipe vices and their special line of adjustable dies and stocks are arranged in the bottom.

GEORGE F. BARD, Norwich, Conn., was in town this week and arranged for a New York agency for his new expanded nipple holder, for threading right and left nipples, with Alexander Don, 61 Gold street, New York.

EARLY LAST SUNDAY MORNING a fire broke out in the building occupied by the Nason Mfg. Company, at 71 Beekman street, New York, and before the flames could be subdued their stock of plumbers' and steamfitters' supplies was damaged to the extent of \$15,000, and the building to the extent of \$20,000. The company immediately cleared away the wreckage and are now in a position to fill all orders promptly.

THE W. H. PAGE BOILER COMPANY, Norwich, Conn., are issuing a new pamphlet of the All Right and Volunteer steam and hot water boilers, the cover of which has an embossed gilt design. The title page is lithographed, showing a Volunteer hot water boiler, and the next page shows a picture of their plant. The book is provided with a very complete index. The first pages present an announcement of the points of excellence in brief and a short comparison of steam and hot water for heating. A brief description and several cuts are used to show the construction of the All Right boiler, followed by a table giving the dimensions and the rating for carrying radiation. The next pages are devoted to sectional views of the Volunteer steam and hot water boilers and a brief description of their construction and operation, followed by tabular information. The Page Safety Sectional boiler, for both heating and power, for brick setting, is also shown by several views. One of the features of this boiler is a 2 inch extra heavy pipe, which is carried between the grate bars from the back of the boiler to the front, where it rises and connects with the front section. This boiler can be arranged with as many as 24 sections, when it has a capacity for carrying 4900 feet of direct steam radiation or 6500 feet of direct hot water radiation. A telegraphic code occupies two pages. The next 24 pages of the book are devoted to testimonials, with half tone engravings of some fine churches, residences and business blocks in different parts of the United States, with text describing the results secured from the boilers in operation.

LOCKWOOD & ADAMS, 143 Centre street, New York, have taken the New York agency for the Exeter line of radiators, made by the Exeter Machine Works, Exeter, N. H.

WM. P. THOMPSON, 112 Broad street, Philadelphia, State Organizer of the Master Steam and Hot Water Fitters' Association of the United States for Pennsylvania, has issued a call for the steam fitters of the State to meet at the Continental Hotel, Philadelphia, June 12, for the purpose of forming a State association.

The Enterprise Boiler Works, Youngstown, Ohio, have lately completed a stand pipe for the water works at that place which holds 538,000 gallons and work has been commenced on a second of similar dimensions.

Trade Notes.

THE ELECTRIC METAL POLISH COMPANY of New York City, have been incorporated, with a capital of \$1000, to manufacture and sell metal polish. The directors are C. Cornhelin of Brooklyn, Chas. B. Peyn of New York and H. C. Hucklin of Jersey City.

"SELECTIONS FROM THE POETS" is the title of a pamphlet issued by the Meriden Machine Tool Company, Meriden, Conn. A number of quotations from well known authors and a number from authors not so well known are presented in a way to incidentally call attention to the product of the company. The attraction of the pamphlet can best be understood by inspecting a copy of it.

AT A MEETING of Coopersburg, Pa., citizens, last week, plans were formulated for the organization of a stock company to engage in the manufacture of Metallic Shelving for vaults and libraries and Metallic Paper Files. Thus far over \$13,000 have been subscribed. By all appearance the project will be a success, and a three story factory building, 100 x 32 feet, will probably be erected and in full operation in three months' time.

THE CLEVELAND STAMPING & TOOL COMPANY, Cleveland, Ohio, inform us that they have recently added an enameling plant to their already extensive works and are now prepared to furnish their entire line of solid steel Hollow Ware enameled. They also say they have added a number of new designs to their line. Their 1895 spring catalogue is now in press and will be ready about May 10.

THE ORNAMENTAL IRON WORK being placed in the Marquette Building, the latest and second in point of size of the Chicago "sky scrapers," will, when completed, be one of the finest examples of American design and workmanship in metal in the country. Incorporated into the design are 24 large panels in cast statuary bronze, portraits of Marquette and his associates and of noted Indians; also scenes in the life of the missionary voyager produced in relief by the American sculptors, Edward Kemeys and Henry McNeil. The work has been executed by the Winslow Bros. Company of Chicago. The works of this company are now being operated to very nearly their full capacity, which gives employment to nearly 800 skilled artisans. Among the larger contracts recently awarded to this company are those for the ornamental iron work in the Jordan, Marsh & Co. Building, Boston, Mass., and the Guaranty Building and Ellicott Square Building, Buffalo, N. Y.

THE ADVERTISEMENT on another page of this issue of the Troy Nickel Works, Troy, N. Y., calls attention to their well known line of Alaska goods and illustrates examples of them. A special feature of the advertisement is the reference to their Troy dampers, which require but one hole in the pipe. In practical operation these dampers have proven exceptionally durable and we understand are giving very general satisfaction.

P. J. CONROY & Co., Paschall Station, Philadelphia, issue an 1895 illustrated catalogue and price-list in the interests of their Automatic Refrigerator Door Fasteners and Locks, which are shown in various styles and finishes, also Hinges and Refrigerator Trimmings.

THE NEW SHEET MILL DEPARTMENT has been put in operation at the plant of the W. Dewees Wood Company, McKeesport, Pa., and all the departments of the plant are now running full.

B. B. MORRISON has leased the four-story building at 231 Water street, New York City, a portion of which was lately occupied by N. & G. Taylor Company, where he proposes to carry a large stock of foreign and domestic Tin and Terne Plates, Sheet Iron and other

which represent for the most part machines of various kinds, are finely executed and indicate the excellent quality of work turned out by this well known engraver, who numbers many patrons among the stove foundry and others.

The McDowell Portable Oven.

The McDowell Portable Oven Company of 206 State street, Boston, Mass., have recently improved what is known as

McDowell Portable Oven.

Metals, as well as a very full line of Roofers' and Tinners' Supplies of every kind, for the benefit of the smaller consumers. Mr. Morrison has a large circle of friends in the Tin Plate trade in this section, having been with the firm of Bruce & Cook for several years.

THE PENNSYLVANIA RANGE BOILER COMPANY of Philadelphia, Pa., have been licensed to incorporate, capital stock being \$75,000; directors, Edmund L. Leary, William H. Marsh, John P. Harlan, Lawrence B. Leoy and G. Eugene Harlan, Philadelphia.

THE COMBINATION MONTHLY CALENDAR card and blotter issued by the Joseph Dixon Crucible Company, Jersey City, N. J., shows a wreath crowned Dixon pencil, which is the May pole, around which other smaller pencils are dancing in celebration of the season.

The San Antonio Sewer Pipe Company, San Antonio, Texas, which were recently formed with a capital stock of \$100,000, have purchased clay fields and a large factory building and have placed orders for the necessary machinery. They expect to begin the manufacture of sewer pipe, terra cotta and tiling within the next few months.

A. Mugford of Hartford, Conn., has issued some samples of the engraver's art showing the character of the work he is prepared to execute on short notice. The illustrations are presented upon a series of sheets of heavy paper bound together at one side by means of silken cord. The printing upon the cover is in red and black, the former color predominating. The illustrations,

the No. 4 Oven of the 1895 pattern, an illustration of which is presented herewith. This oven has been thoroughly reconstructed inside and out, making, it is claimed, a practically perfect portable oven with baking capacity equal to a brick oven 10 x 12 feet inside measure. In addition to the original packing of asbestos there is a solid wall all around the oven composed of non-combustible material and designed to prevent the loss of heat by radiation while effecting a great saving of fuel, time and strength. These the company state are three important items and constitute features which cannot fail to be appreciated by the trade. The company have issued a neat catalogue illustrative of the portable ovens which they manufacture and giving prices, dimensions and full descriptive particulars. From the testimonials which are presented it is evident that the McDowell Portable Oven is a favorite and has been well received wherever introduced.

It is reported that the Japanese of Tokio propose to erect, as a commemoration of their recent war with China, an enormous steel tower, to be about 1000 feet in height, fashioned after the plan of the Eiffel Tower in Paris. According to the proposals, a large hall on the ground floor will contain a permanent exhibit of Japanese products, while rooms are to be provided in the upper galleries for statues or memorials of Japanese statesmen, warriors and others who have rendered conspicuous service to their country. Popular subscriptions are reported to be pouring in fast for this object, and there is said to be little doubt about the plan being carried into effect.

Double Seaming Machine.

E. W. Bliss Company, Brooklyn, N. Y., have bought out what they describe as their No. 02 double seaming machine, intended for round cans. The special feature of this machine is that the cans stand still during the seaming operation instead of being revolved while being seamed. The stationary machine permits the seaming to be done on cans which have to be filled before the lid is seamed to the body, such as paint cans, some kinds of condensed milk cans, &c. The hand lever shown on the top of the machine in the cut is used for actuating the two double seaming rolls which revolve with the large disk around the stationary spindle. The pressure plate fitting the lid of a can is attached to this spindle. The can is raised against it by means of a foot treadle, and the two double seaming rolls, revolving around the can, are successively brought to bear against the edge, thus rapidly double seaming the lid. Adjustments are provided for adapting the machine to any size within its range. The largest diameter of the can adapted to be seamed with the regular disk is 6 inches, and with special disk 9 inches, and the height

Double Seaming Machine.

of the cans to which it is adapted is 9 inches. The total height of the machine is 5 feet 5 inches and it weighs 550 pounds.

A bill has been introduced in the Canadian House of Commons to amend the Railway act by preventing the Government giving railroad contracts to foreigners.

One of the most interesting features of the international exposition to be held at Atlanta, Ga., next September will be a negro building, 276 feet in length, in which will be demonstrated in object lessons the progress made by the Afro-American race since the days of slavery.

STOVE TRADE NOTES.

Gasoline Stoves and the Insurance Companies.

We have been surprised at recent complaints from correspondents located in the East to the effect that their business in gasoline stoves was being interfered with by the insurance companies, who had suddenly determined to enforce extra rates where gasoline stoves were used. An investigation of the situation in the Eastern States, with a view to discover whether this was uniformly the case, has been attended with considerable difficulty, and it is not easy to determine just what the situation is. It would appear, however, that the letter of the law as existing among the insurance companies is not enforced, in all cases. It has been intimated that the companies, finding last year so unprofitable, determined to use every means possible to increase the profits this year, and among other things increased the rates on gasoline stoves. In some instances they have succeeded in making people pay for the gasoline clause, but in more cases, as far as we can learn, they have not even attempted to enforce the new order of things.

Introduction Opposed by Eastern Companies.

When gasoline stoves were first talked about in the East a few years ago the insurance companies were almost as a unit opposed to their use. In New England especially they barred the use of the new apparatus by exorbitant charges and the result was to discourage the gasoline stove manufacturers from attempting to sell in that section of the country. As a result of persistent effort, however, on the part of those who were interested in the gasoline stove the insurance companies were little by little persuaded that it was not an unduly dangerous fuel, and it came to pass that permits were generally granted without extra charge.

We addressed inquiries lately to the New England Insurance Exchange, located in Boston, which is the body governing most of New England, asking for the position of the companies relating to gasoline insurance and received the following reply:

We would state that the matter of charges for the use of gasoline stoves varies in New England, it being left to the various local boards to decide this matter.

They inclosed us a copy of a permit required on all policies where permission to use gasoline stoves is granted. This permit is in the usual form, reading: "In consideration of — dollars,

extra premium, permission is hereby given, &c."

Increased Rates Applied With Discrimination.

We have letters from several prominent dealers in New England which would indicate that the general practice is not to charge for the use of gasoline. A correspondent in Hartford writes:

The New England Board of Fire Underwriters voted to allow the insured to use gasoline stoves with ordinary restrictions and no increase in rates. A dealer wishing to place them on sale, or a party desiring to use one for cooking apparatus, notifies the agents of the company and they give a permit to be placed with the policies. We have renewed two policies since April 1, 1893, both with the permit on them.

Another letter which goes somewhat extensively into the situation comes from a representative dealer in a representative Connecticut town:

I took particular pains to see a member of the local Board of Fire Underwriters and he assured me that there would be no extra charge for the use of gasoline stoves. All that would be necessary would be a permit to use one. I do not know how many companies this includes, but I am satisfied it takes in all companies doing business in this locality, as all the local agents are united and have a regular board, so that the rule in regard to gasoline stoves governs them all. My informant told me that the clerk of the board received his instructions from headquarters the first of the year to make charges, but it was afterward recalled, as it was a mistake to send out such instructions in the first place. I think this is what has caused all the misunderstanding in regard to extra charges.

If the experience of this writer represents the general situation throughout the New England States it would seem that the insurance companies had endeavored early in the year to enforce higher charges, but on consideration had recalled the instructions, the result being a good deal of confusion.

The Situation in New York State.

In New York State outside of New York City and adjacent territory the insurance matters are under the charge of the Underwriters' Association located at Syracuse, N. Y. In reply to a letter addressed to the secretary of the Underwriters' Association we are advised:

In a few localities in this State permits are granted gratis for the use of gasoline stoves in dwellings, but in more a charge is made. Each local board of underwriters has rules of its own on this subject.

The advices from the secretary of the board bear out very closely what we have heard from correspondents in different

parts of the State. The practice does apparently vary, and as the result of this unreasonable action on the part of the insurance companies there is a decided variation of feeling, which quotations from a few letters will suffice to indicate. A correspondent in a large city in the central western part of the State writes:

The gasoline stove we handle is on the insurance list and a permit is given for its use by the insurance companies without any extra expense.

Our correspondent then goes on to specify the regulations respecting the storage of gasoline, saying that one company has forbidden them to keep their storage tank within 15 feet of the stove, while others make no such exception.

Another correspondent writes:

We have no trouble with insurance on gasoline stoves except with those outside of the trust. There is no charge for insurance that we ever heard of.

Letters like that would seem to indicate that everything is smooth for the dealer in gasoline stoves and the user of the same in New York State, but to show that the practice does vary as intimated, we present the following from a correspondent in the eastern central part of the State:

The greatest outrage ever imposed upon us is the way the insurance companies have treated us on gasoline stoves. Hundreds of families would use gasoline stoves if they could do it without any trouble, but in every policy they put in a clause that the holder of the policy cannot recover if the fire occurs from gasoline. The result of this treatment has been that our trade in gasoline stoves has been destroyed entirely.

We trust for the good of the trade throughout New York State that this latter correspondent does not represent the majority of cities and towns. We have reason to believe that his experience is the exception and if he will keep up persistent agitation that he will soon be relieved of the burden of increased insurance charges on this score.

New York City and Neighborhood.

In New York City and adjacent territory insurance matters are under the control of the Suburban Underwriters Association, who have a gasoline stove permit designating by name the stoves that may be used and specifying how the gasoline shall be handled, &c., as well as adding a list of charges, according to which a policy holder must pay \$1 a thousand extra where gasoline

stoves are used. How generally this clause is enforced, however, is another matter. Conversations with the insurance companies elicited little information. They point to the clause and intimate that they make the charge, but the impression is gathered, nevertheless, that all of the companies in the association are not particular about enforcing it, and as a matter of fact some of the prominent insurance companies are opposed to making gasoline stoves an extra risk. A letter from a New York dealer is typical, we imagine, of the situation in many places:

I have never been charged anything extra for gasoline stoves. But one policy this spring had a charge of \$2 extra when renewed for the gasoline clause. I had the policy canceled and gave it to another agent and he insured it without any extra charge for the gasoline clause. Another policy expired last week in the hands of the former agent and he sent a renewal with the gasoline clause attached, but no extra charge. I find the agents are collecting it whenever they can and it does interfere very much with the sale of gasoline stoves. My customers complain of the high rates of insurance without paying extra for the use of gasoline stoves. It seems the agents have the privilege of collecting more if they can.

This, as we mentioned, may be taken as a typical case, and illustrates the unfortunate condition of affairs in the East. The companies nominally make the charge, but if sufficient objection is raised do not actually collect it. In some localities they have all the companies well bound together, and those who use gasoline are forced to pay for the privilege. A prominent dealer, writing from one of the larger towns of Long Island, says:

Insurance companies, with the exception of two, are insisting upon an extra charge of \$2 per \$1000 for permission to use gasoline stoves. It is a drawback to the sale of such stoves. Until recently certain approved stoves have been accepted in a risk without extra charge. I find that the practice of local agents is not to inquire too closely into the question of what kind of a stove they are permitting to be used, as it is against their interest to discover a stove that underwriters discriminate against. If we could have competition among the insurance companies the evil would right itself.

An Aggressive Stand Will Win.

We have given a few illustrations from different parts of the East to show what the situation is. It is, however, but fair to the insurance companies to explain that there have been instances of individuals having complained of being unable to insure for gasoline stoves, and the result of investigation has shown pretty clearly that the objection of the companies was a personal matter and that the individual's reputation had been shaken by too frequent configurations. It is also true that the companies sometimes utterly refuse to take an extra hazardous risk involving the use of gasoline stoves. In such a

case the refusal is due more to the location or some other feature of the premises than to the use of gasoline. But these exceptions have nothing to do with the general attitude of the companies on gasoline insurance.

We would be glad if this brief survey of the situation in the Eastern States might have the effect of awaking dealers, manufacturers and all interested in the use of gasoline to the necessity of fighting the insurance companies on what appears to be their very unjust discrimination. More especially is it shown to be unjust from the fact that charges are enforced in some cases and not in others; the discrimination is proof of the weakness of the insurance companies' position. We shall be very glad to have dealers, manufacturers and others use our columns freely, and if anything is to be gained by discussion we will do everything in our power to give the matter publicity.

Cost Formula.*

BY J. W. VAN CLEAVE.

Mr. President: You know with what reluctance I consented to say anything in regard to the cost formula, but I realized the correctness of your position when you suggested that in order to succeed at anything in times like these one must keep everlastingly at it, and that—

The constant drop of water
Wears away the hardest stone;
The constant gnaw of Towser
Masticates the toughest bone;
The constant cooling lover
Carries off the blushing girl,
And the crank on cost production
Gives them all the whirl.

With the experience of the past before me on matters pertaining to cost accounts and the cost formula as adopted by the National Association, and particularly in view of the discussion of this subject at the meeting held in Chicago in 1893, I realize that a great many feel that some of us are cranks on accounts, and some doubtless go so far as to feel that we are inclined to force our opinions upon the members of the association, but I trust that the explanation that you have made and the fact that this effort on my part is at your request will prevent any one from criticising any statements that I may make or misjudging my motives.

I have made the statement that any intelligent man, after thoroughly examining or using the formula as adopted by the association, would be led into making changes that would serve to simplify keeping of accounts that would enable the manufacturer to ascertain the cost of individual stoves, and that the results would be equally as accurate, if not more so, than if the formula was used exactly as it now appears on the records of the association.

Mr. Thomas has said that there is not any question but that three accounts could be opened which would embrace the whole cost of the output of any foundry in the country—that is, absolute cost, general manufacturing expense and general distributing expense—and that all the information necessary to obtain the cost of the in-

dividual stoves by the formula now in use could be obtained just as well with those three accounts as the number that are required in the association formula. My experience of the past five years has all tended to confirm this statement, but my experience has also taught me that there is great satisfaction and profit and information to be derived from the keeping of a cost ledger, or, as we term it, a subsidiary ledger, which is simply a book in which all items pertaining to absolute cost, manufacturing expense or distributing expense are kept and itemized, each item of expense that represents all general articles used in our daily practice having a heading of its own.

Cost Ledger.

If a cost ledger is kept monthly or daily, and every item of expenditure, whether pig iron or stove putty, is kept under a heading of its own—that is to say, having an account of its own—and just a little intelligence used in classifying these accounts under their proper head of absolute cost, manufacturing expense and distributing expense, it would be easy then at the close of the fiscal year to draw off a balance sheet of the cost ledger under each general head of absolute cost, manufacturing expense and distributing expense, and the total expenditure for every item used during the year would be shown, and the total of each account would be the factors that are necessary in order to ascertain the cost of any individual stove produced in any foundry in which this cost ledger is kept. What I mean by factors is the ratio of general manufacturing expense and general distributing expense.

The conclusion has been forced upon my mind for the past ten years that a great many manufacturers, by reason of the fact that they do not keep a daily itemized ledger of their expenditures, lose sight of many items of expense when they come to compute their cost, and there is no other way in which every dollar that cannot be charged specifically to any stove that is made can be included in the cost of the stove except by percentage; therefore, it must be apparent that the object of these two accounts—that is to say, general manufacturing expense and general distributing expense—is to ascertain the ratio of expense that each of these accounts bears to the total cost of the output and to the total volume of business.

The form of the formula for ascertaining the cost of individual stoves recommended by the committee and adopted as a part of the cost formula is sufficient in itself and is susceptible of any change required by any individual manufacturer to make it applicable to any special feature that might exist in his business. To illustrate: If, like ourselves, a manufacturer has a special feature, like the enamelling of oven doors, the same as many of you now have, the tin lining of oven doors and so on, the main point and the object to be gained is, first, the total cost of a year's production in detail, that is to say, an itemized account of all material, labor, &c., used during the year, and a ledger kept accurately for one year will demonstrate, I am sure, to any gentleman present that the formula presented by the committee could be very much simplified.

Objections to the Formula.

The objections that I have always had to the formula adopted by the association, and its adoption reaffirmed at the meeting in 1893, are the proposed division of accounts; that is to say, the charging of 37½ per cent. of manager's

* Read at the convention of stove manufacturers held at Chicago, May 1, 1895.

salary to general foundry expense and 6 3/4 per cent. to general distributing expense. I have been opposed to a division of accounts and do not believe it is necessary, and to this extent I think the formula presented by the committee (of which I was a member) has been misleading, and as has been stated here, the formula and cost ledger as proposed, as well as the discussion that has taken place, appear to a great many members of this association as a foreign or unknown language. They do not seem to comprehend it, and the whole object I have had in view in anything I have said on the subject was, if possible, to present this cost formula in a simple form, so that the average book-keeper, such as we employ, can master all of the propositions contained in it, and that not only professional accountants and cranks on accounts could understand it, but the average manufacturer or officers of these stove corporations could thoroughly understand them. As Mr. Pfahler has said, the larger institutions employing more competent accountants could subdivide these accounts indefinitely, because they want the knowledge it gives, but there are a great many people who either do not care for this information, or whose lines of goods are so simple that it is not necessary for them to have these accounts subdivided. Therefore, this class of manufacturers seem to have taken no interest whatever in the cost formula, and it is for this reason, in my opinion, that more stove manufacturers have not adopted the formula as presented by the National Association. Hence, I say it is true that in a small foundry manufacturing a few articles that are simply castings, it is unnecessary for them to keep a cost ledger, but they can keep in their general ledger three accounts headed absolute cost, general manufacturing expense and distributing expense, thus enabling such a manufacturer to ascertain as nearly correctly as any of us can the cost of any of the goods produced by him. If this is true, then the simple formula can be adopted by the larger and more extensive manufacturer, and the accounts of the larger business subdivided until each item entering into the cost of the construction and distribution can be kept under a separate heading and a balance sheet drawn off at the end of the year, showing the total cost under the head of the three accounts that are proposed.

Interest on Capital.

It is my intention to enter into the discussion of the subject of interest on capital, but knowing that it is a subject upon which business men as well as manufacturers differ widely, and having thought a great deal over it in the past five years, and the more I think of it the more objectionable it appears to me, in fact I believe it is wrong and serves only to deceive, and that for the purpose of ascertaining the cost of goods manufactured, the charging of interest on capital invested is in one sense like changing your deposits from one bank to another each day, or taking a dollar from one pocket and putting it into another and calling it business.

If a manufacturer has \$500,000 capital in his business and the absolute cost of his annual production is \$300,000, then 6 per cent. of his capital is 10 per cent. on his absolute cost, and if the absolute cost of a certain stove is \$10, then 10 per cent. is added to the absolute cost, interest on capital being treated as a manufacturing expense in order that it might enter into the cost of every stove. You will see that under

the present formula you would add 10 per cent. to the \$10 absolute cost of the stove, or \$1; you would then add to this dollar your distributing expenses, which we will say is 25 per cent. more, making \$1.25; to this \$1.25 you will add 20 per cent. for net profit, thus adding to your selling price \$1.50, one-third of which amount is added to the 6 per cent. interest on your capital. The only difference between the above problem and the present formula is that under the present formula 6 3/4 per cent. of interest on capital is charged to general manufacturing expense and 3 3/4 per cent. is charged to distributing expense, and I am sure these two propositions will show how ridiculous it is to use interest on capital invested as a factor of cost.

In addition, the rate of interest is governed entirely by the location of the business; for instance, the rate in New York might be 4 per cent., in Kansas City 8 per cent., and in Texas 12 per cent.; therefore, I would recommend that this feature of the cost formula be eliminated, as it only serves to deceive, and for that reason it is impossible to get more than half of the manufacturers to use the feature of interest on capital in ascertaining cost.

Uniform Methods.

This leads to one of the most important features concerning cost accounts. It has been frequently stated by members of the association that uniform methods in the keeping of cost accounts were of more consequence than absolute accuracy. This statement has never been denied; on the contrary, it has been accepted by all members of this association as being true; therefore, if it is true that a uniform system of keeping cost accounts is of such importance, and if it is true, as was stated by Mr. Sard in 1892, that the formula, as now presented, was a pretty complicated matter—and if it was complicated to a man like Mr. Sard, what must it be to a man down in St. Louis or even in Chicago?—my suggestion would be that in view of the fact that a great many people must creep in the matter of cost accounts before they can walk, that a form of cost ledger be prepared and presented to the association in a more simple form, but retaining all of the essential features of the present formula, which would necessitate the keeping of only three accounts—viz., absolute cost, manufacturing expense and distributing expense—and I would most earnestly recommend every member of this association and every stove manufacturer in the country to keep an itemized cost ledger divided into three parts, the first to contain all of the accounts of all items entering into manufacture that can be charged specifically to the individual stove, such as pig iron, molding, mounting, rods, knobs, and all materials of that class.

2. All items entering into the cost of manufacture that cannot be charged to any individual stove specifically, such as superintendents, clerks, watchman, miscellaneous labor, sand and facing, molders' and mounting tools, emery wheels, oils, waste, gas and water, insurance and taxes, rivets and washers, stove putty, lumber, patterns and flasks, and in fact all items of expense that cannot be charged directly to any individual stove, and all items that must of necessity be spread over the cost of manufacture by percentage and which cannot under any circumstances be charged specifically to any individual stove.

3. Salaries of all officers, clerks, part-

ners, &c., traveling expense, discounts and interest on borrowed money, discounts for prepayment, advertising, stationery, postage, traveling salesmen, allowances, attorney's fees, losses, &c.

If a ledger of this kind is opened by the smallest or largest manufacturer in this room, there would be found a large number of accounts and items of expense in each subdivision that no cognizance has been taken of heretofore, and it would take very little experience or intelligence to separate and classify these items of expense into their proper departments, and this, in the net, is my proposition to simplify the cost formula which we have adopted, without any complication, subdivision of accounts, interest on capital, &c., such as serves to complicate the present formula.

Cartage.

At the meeting in 1893 the subject of cartage was discussed, and I desire to give you our own experience on the item of cartage, in the hope that our treatment of it may establish a precedent for the future not only of this account of cartage, but of any similar account that may present itself in the experience of any individual manufacturer. We have no store or branch house, and our general office is at our foundry. We keep what we term a cartage account, which is practically a stable account, as we own our teams. We charge to this account all labor, feed, repairs, wagons, purchase of stock and every item of expense pertaining to the maintenance of the teams. This expense, in addition to the deductions made at the close of each fiscal year for wear and tear on stock and vehicles, represents to us the cost of cartage for the fiscal year. We keep a record daily of the amount of cartage charged, and at the end of each month a proper entry is made giving the stable or cartage account credit for the amount that it has earned. At the end of the year the difference, whether a credit or a charge, is disposed of to proper account, whether to manufacturing or distributing account matters little for this illustration.

Thus you will see that the keeping of an itemized ledger, or cost ledger, or subsidiary ledger, as it is termed, necessitates the entering of every expenditure, as well as the opening of innumerable accounts covering all purchases made and expenses for labor, &c.; that it is a necessity, a complete history of the year's business; and with the balance sheet drawn off from a ledger of this kind it then becomes an easy matter for any intelligent man to ascertain the cost of any article produced by him, whether a stove, piano or sewing machine. It must be borne in mind, however, that the most important results to be obtained from the keeping of this subsidiary ledger are to ascertain accurately the ratio which foundry expense bears to the absolute cost of the year's product, so that a certain percentage can be added to the known absolute cost of any individual stove, thus giving the cost of the stove in the warehouse.

Distributing Expense.

The same is true of the distributing expense to be applied in a similar manner. There is one most important feature in connection with the selling price of manufactured goods, and it is one that very many bright men have seemingly been unable to comprehend, and it is one that the failure to understand has caused the business men of this country more loss than any other feature of their business, and that is a proper

understanding as to the proper application of distributing expense to the cost of goods in the warehouse. It is not at all difficult to apply manufacturing expense to the absolute cost, for the reason that the two accounts are fixed factors, but the distributing expense is different. The ratio of percentage of the distributing expense is obtained by using the total amount of annual sales and the total amount of distributing expense. This is common practice. If, therefore, the amount of goods sold is used as a factor to obtain the ratio of distributing expense, is it not a fair proposition to use the selling price of a stove as a similar factor, and if the ratio of percentage is found to be 20 per cent., for illustration, then the cost of selling the individual stove should be obtained by taking 20 per cent. of the selling price of the stove, and not 20 per cent. of the cost of the stove in the warehouse. The best proof of this is the fact that distributing expense does not apply until the stove is sold. To illustrate : Let the cost of a certain stove be \$10 in the warehouse; let the selling price be fixed at \$13, and the ratio of distributing expense based on the gross sales be fixed at 20 per cent.; it would then cost \$2.60 to sell the \$13 stove, thus making the cost of the stove sold \$12.60 and the net profit 40 cents.

Again, there are no two lines of stoves or item of manufacture that pay the same gross or net profit; hence the difficulty of knowing the actual cost of selling expense on any one stove unless the result is obtained as above stated.

Last, but not least, this system is absolutely safe. By using the factors given herein the danger line, when figuring close selling prices, is always a prominent feature; the prominence of this danger signal would surely lead to an intelligent examination into the actual cost of selling the individual stove, which would at once establish the business upon a more profitable basis.

The old system of computing cost upon the ton basis is another proof of the soundness of my proposition and an indisputable argument against the fallacy of the old method. It has been said that it is easy to criticise and tear down, but that it is hard to create or build up, and I take it for granted that the real meaning of this is that most any one can tear down, but that it takes a really smart man to create and build up. Therefore, with a view of completing these suggestions I have made, I desire to present to you an imaginary balance sheet, taken from an imaginary subsidiary ledger, containing such accounts as I have recommended to be opened in a cost ledger for a foundry doing a business, say, of \$100,000 per annum. I will thank you all to please bear in mind that the figures are used here simply as an illustration, but that everything that is presented at this time and every account which is referred to is taken from our subsidiary ledger, and is in daily practice and is not in any sense theoretical.

Imaginary Balance Sheet.

Before entering into an explanation of this imaginary balance sheet I desire to call attention to the fact that in every foundry there are almost daily unexpected items of expense presented to the management. In addition to this there are very many expenses that are not noted in the ordinary run of business unless a system such as suggested—that is to say, the keeping of a cost ledger or subsidiary ledger—is made a part of the daily practice. I refer to such accounts as breakage all about

the foundry, and especially in the mounting room. This breakage represents to the manufacturer a cost of molding, cleaning, grinding, piling and handling goods, and unless a correct account is kept of such breakage and the item entered into this subsidiary ledger is there any way on earth that this expense can be merged into the cost of the goods, except by making it a part of the manufacturing expense and applying it by percentage? There are many such items. For instance, the keeping in order of the patterns, such as waxing them or taking care of them, or putting them into pattern vaulds, &c.; miscellaneous lumber that is used, the breakage in piling and handling of goods and the cost of repairing same, stove putty, the blacking of stoves for sample purposes, repairs to building, machinery and all such expense as that, and unless records are kept of them or the charges made directly and specifically to accounts such as I suggest, is there any way to get these items of expense into the cost of each individual stove except by percentage?

There is another suggestion that I

would make, and that is, that every department of your business should be separated in exactly the same manner that you separate the stove business that is to say, if you are running a nickel department, why, treat all of the items of material, labor, &c., exactly as they are treated in your general accounts, charging to the department all expenditures made for it and crediting the department with the goods produced by it at a fixed price, and closing the account at the end of the year with either a credit or a loss, as the case may be. Unless a business which has various departments of this kind is kept in this way it is very easy to make the mistake of omitting entirely the total cost of such department from your calculation of cost.

[Mr. Van Cleave drew upon a black board a statement of costs to accompany his paper, of which we present a copy below. The percentages are, of course, arbitrary and are not intended to be exact, but merely to illustrate the scheme of calculating costs which Mr. Van Cleave suggests.]

ABSOLUTE COST.

<i>Pig Iron.</i>	<i>Cupola Cost.</i>	<i>Molding.</i>	<i>Mounting.</i>	<i>Cleaning and pitting.</i>	<i>Miscellaneous supplies that can be charged specifically to each individual stove.</i>
Inventory \$800 Purchase. 10,000 10,800 Stock..... \$90	Coke, labor, flux, fire clay, kin- dling, re- pairs. \$2,300	\$19,000	\$5,000	\$1,350	\$16,450
\$10,000	\$2.20 per ton.	\$19 per ton.	\$5 per ton.	\$1.35 per ton.	
<i>Distributing expense.</i>		<i>General manufacturing expense.</i>			<i>Net earnings.</i>
Salaries of office clerks, traveling, advertising, discounts on prepay- ments, interest and dis- counts on borrowed money, attorneys' fees, postage, stationery, char- ity, miscellaneous ex- pense.....	\$30,000	Superintendent, miscellaneous labor, sand and facing, putty, fuel, engine and machinery expense, oil and waste, gas and water, insurance and taxes, inspection, instructor, fore- man, patterns and flasks and main- tenance, all miscellaneous manu- facturing expense, breakage in all departments.....			\$12,500 \$18,500

COST OF 200-POUND STOVE.

Iron, melted.....	\$1.21	Cost in warehouse.....	\$9.75
Cleaning.....	.14	Selling price.....	\$10.00
Molding.....	1.90	Cost of selling (20 per cent.).....	2.00
Mounting.....	.60		\$8.00
Nails, bolts, knobs, mica, door linings, crating, nickel, ash pan, &c....	1.55	Net profit on selling price.....	1.25 6.75
	\$5.40		
Twenty-five per cent. foundry expense..	1.35		
	\$6.75		

RECAPITULATION.

Pig iron.....	\$10,000		Cost in warehouse	\$87,500
Capola cost of melting, 2.20	\$2.20 per ton.		Distributing expense, 20 per cent.....	20,000
Cleaning and piling	1.35	1.35 per ton.		
Molding.....	19,000	19.00 per ton.		\$87,500
Mounting.....	5,600	5.60 per ton.	Net profit.....	13,500
Miscellaneous supplies				<u>\$100,000</u>
chargeable specifically to each stove.....	16,450			
	<u>\$54,000</u>			
Manufacturing expense, 25 per cent.....	13,500			
	<u>\$87,500</u>			

Echoes of the Stove Convention.

—THE BANQUET will very probably be one of the features of future conventions. It is regarded as probably the most successful means of cultivating sociability and bringing members into close personal relations that could be devised. Greater interest appeared to be taken in all the proceedings of this year's meeting than for some time, and this is ascribed to the fact that the banquet broke into the usual monotony of practical business sessions, with their constant discussion of technical subjects, and for a time turned the thoughts of the members into a lighter vein. Many interesting speeches were made upon this occasion, some of them brilliant, others full of pungent but good natured satire, and not a few devoted to serious matters and bristling with wholesome truths. Occasionally a speaker was gayed by some of his jovial friends, but none were disconcerted, and often the tables were turned very neatly on those who began the attack. President George D. Dana made an admirable toastmaster, introducing each speaker with an appropriate sentiment or with a suggestion which formed a good topic for treatment on such an occasion. The orchestra had been coached, and the selections played after the speeches often added zest to the remarks made. For instance, after the speech of Henry Cribben, president of the Defense Association, it was a happy thought which suggested "Baby Mine." It may perhaps be well to remark that at this banquet the free list was absolutely suspended. Everybody present, including trade representatives and the press, paid his quota of the expense.

—A NOTICEABLE EVENT of this year's convention was the return to the fold of some of the wandering sheep. Several prominent houses, whose representatives had been conspicuously absent for some years, renewed their membership and signified their intention to hereafter take a greater interest in the work of the association. This is of more than ordinary significance in view of the fact that reports had been in circulation of a probable abandonment of the National Association and the continuance of the Defense Association as the sole national body. The argument has been made that local associations answer all the purposes aimed at by the national, and that they would be strengthened and made much more influential if they received the entire attention of those who now attach most importance to the proceedings of the national organization. But the remarkable interest displayed in the convention of 1895 has very probably put a stop to all thought of discontinuing the work of the national. It certainly provides an opportunity for the interchange of views among manufacturers of all sections which they would not otherwise enjoy, and thus tends to soften asperities and mitigate the harshness of commercial warfare. Such an opportunity would not be presented in the Defense Association, which has been organized for a specific object and does not include so general a membership.

—THE SELECTION OF NEW YORK as the place of meeting for the next annual convention is regarded with much sat-

isfaction. The annual gatherings have been held in Chicago so long that the National Association almost appears to be a Chicago organization. That city is unquestionably an excellent place for a convention, being easy of access to a very large number of stove manufacturers and almost every Eastern manufacturer having a Chicago connection whom it is desirable to visit at least once a year. But a national body cannot afford to have a distinctly local flavor, and this it certainly acquires by successively meeting in one city. New York has now broken the Chicago charm and perhaps some other city even less familiar to stove men may be chosen for the succession. Hopes are entertained that by meeting in the East the interest of more Eastern manufacturers will be excited and that further accessions to the membership may be secured among those who have regarded the national stove organizations as mainly under Western influence. Possibly another reason for going to New York may be to test the character of Eastern hospitality and compare it with the Western brand. It therefore behooves our Eastern friends to look to their laurels in this respect.

—THE ELECTION OF LAZARD KAHN to the presidency of the National Association leaves behind it no sting. He is exceedingly popular, possesses great ability, is a ready speaker, takes a liberal view of affairs, is a man of decision, has the confidence of his associates and is expected to make a fine president. There are other aspirants to the position who would also fill the chair very creditably, but the fact is recognized that but one man can be chosen. The others will await their turn with patience and the deferred honor will be sweeter when it comes.

—THE RE-ELECTION OF Henry Cribben as president of the Defense Association was in accordance with the established policy of that organization, which is to keep a good man in office from year to year. Knowing exactly the sort of timber they have in Henry Cribben, the members of the Defense Association are disposed to stick to that ship. He has pleased with his associates to be released from the cares of office, but they will not yet permit him to fall back into the ranks.

—THE SELECTION OF THOMAS J. HOGAN as secretary of both associations meets with universal approval. C. W. Sison of Louisville, Ky., received some support prior to the election, but it was decided to make no contest, so that Mr. Hogan's name was the only one presented. In order that both associations might work in harmony in this matter a committee, consisting of Grange Sard, E. N. Peck, C. H. Castle and President Henry Cribben, *ex officio*, was appointed by the Defense Association to meet a like committee of the National Association subsequently appointed, which consisted of J. W. Van Cleave, H. W. Buttorff, D. G. Rennolds and President George D. Dana, *ex officio*. They unanimously recommended Mr. Hogan for secretary of the National Association. Inasmuch as the Defense Association had previously expressed their preference for him, this settled the question. After his

formal election by the National Association he was escorted into the hall by a committee and received with much applause, when he acknowledged the honor in a graceful speech. Mr. Hogan's headquarters, as previously announced, will be in Chicago. He will occupy Room 209 Atherum Building, 52 Dearborn street, immediately opposite *The Metal Worker's* Chicago office. Mr. Hogan's administration is a guaranteed success from the beginning.

—THE HEADQUARTERS OF *The Metal Worker* in the Auditorium Hotel proved very popular and were visited by almost the entire convention. This was particularly the case on Wednesday evening, when a fine view of a fire in an adjoining block was had from our windows. As all other attractions were deserted for this great spectacle, a Chicago fire, and *The Metal Worker's* quarters were so very convenient for its full enjoyment, the wicked and malicious insinuation was made that we had started the fire for this purpose, all of which we most indignantly and vehemently deny. We are not obliged to burn a city to secure the attention of the members of the stove trade.

—H. W. BUTTORFF of Nashville, Tenn., is inclined to take a much more gloomy view of the condition of trade than many of his colleagues. The trade of his house extends all over the South except Maryland. He says that in the past three months collections have been worse than ever before. More of his customers have asked for extensions, more of them have given notes, more of them have allowed notes to go to protest, fewer of them have discounted bills and more of them have made excuses for not paying bills than during the height of the panic. In his judgment the South has been drained of its money and prosperity will not return until we have free coinage of silver.

—D. G. RENNOLDS of Richmond, Va., took a wholly opposite position. He said that in his section the cheapest class of stoves caught the trade, and the way to meet such a state of affairs was to make cheap stoves also. His company had followed this plan and were fairly satisfied with the results, so much so that they felt like chiding those who took too gloomy a view of the situation.

—ALBERT MOFFATT of Marengo, Ill., is reported to have walked in on Wednesday evening, which explains why he was so late at the banquet.

—C. H. TROWBRIDGE of Hannibal, Mo., is not favorably impressed with the outlook for trade. Not enough orders have been entered on manufacturers' book to give the future a hopeful cast. The movement may come later, but if it does it will have to be much heavier than usual to make the year's business what it should be.

—H. TERSTEGGE of Louisville, Ky., asserts that the only way to drive the so-called pirates out of business is by selling repairs at 2½ cents per pound.

Such heroic measures, however, are not likely to be instituted.

* *

— WHO IS THE AUTHOR of the new aphorism, "When you pay the freight you know where the sand comes from?"

* *

— THE DISCUSSION of cost sheets, which was led by J. W. Van Cleave of St. Louis, received more attention than any other single question that came before the convention. The discussion ran on long after the session was over, up and down the corridors, in and out of the elevators, around the tables of the Auditorium café and in front of the mahogany on which liquid refreshment was served by white jacketed attendants. Everywhere was heard, "I add 20 per cent. to the cost," or "I deduct 25 per cent. from the selling price," or some other equally significant formula, but what it all meant none but the initiated could explain—and explanations were out of order.

* *

— THE COST QUESTION is a great weariness to the spirit anyhow. A manufacturer figures on all his elements of cost, looks carefully after every detail, sees where he can cut down some unnecessary expense here or stop some waste there, then determines the price he should sell at to make a reasonable profit, and what is the outcome? He must meet market conditions and sell at a price that will move his goods out of his warehouse.

* *

— THE MOST POLISHED SPEECH at the banquet was made by Grange Sard, the wittiest by Henry Gleason, the most eloquent by Henry Cribben, the most profound by Rev. Dr. Carson and the most vigorous by Fred. E. Lee. The best political speech was made by George H. Barbour, and yet it was without a suspicion of partisanship. It is understood that Mr. Barbour is very likely to be the choice of his fellow citizens for Mayor of Detroit at the next municipal election.

* *

— C. R. VANDERCOOK of Austin, Ill., made a brief visit to the Auditorium during the convention. Mr. Vandercook claims that in 1846 he made the first stoves ever cast in Chicago. He exhibited a copy of the catalogue which he printed in 1848.

* *

— J. L. GOBEILLE of the Gobeille Pattern Company, Cleveland, was warmly greeted at the convention. Everybody remembered his musical treatise of the previous year, and the question was often repeated, "Have you your violin with you?"

* *

— J. H. WHITING of the Whiting Foundry Equipment Company, Chicago, looked in at *The Metal Worker* headquarters. Mr. Whiting is patiently waiting for the "moving of the waters," when large and profitable business will make stove manufacturers as well as all other foundrymen overhaul their appliances and put in the most modern improvements.

— M. J. POWERS, manager of the Albany Facing Mill Company, successors to E. D. Ransom & Co., Albany, N. Y., was one of the trade representatives in attendance upon the convention.

* *

J. J. LEONARD of the Toledo Stove Company, Toledo, Ohio, exhibited circulators of the Palace Gem heater which his company have recently brought out. This is stated to be a remarkable heater, accomplishing wonderful results. In appearance it resembles an oak stove, but it is so constructed that it is a base heater and air circulator. It is made with a large base to contain the base heating flues, which are arranged differently from those of the standard base burner and are claimed to be much more effective in throwing out heat near the floor. The stove is constructed with a movable magazine, to be used for hard coal and removed for soft coal or wood. An automatic attachment opens the direct draft damper when the feed door is opened for feeding soft coal. The stove is a base heater when used with any kind of fuel. The ventiduct is of large capacity and can either be used in heating the room containing the stove or an upper room.

* *

— A GREAT MANY familiar faces were missing, notwithstanding the large attendance at this convention. The strongest proof of the permanence of the organization is perhaps seen in this fact. An association which constantly receives fresh blood is in no danger of becoming moribund.

Foundry Cost.*

BY W. H. FFAHLER.

Mr. President: You have asked me to present for the consideration of the convention of the National Association of Stove Manufacturers a paper on foundry cost, forgetting perhaps that it was a subject which carried with it the entire scheme of foundry practice, and therefore can only be hinted at in a paper which must be brief, if it would deserve to be heard at a time when there are so many things else to consider.

I have said that foundry cost underlies the entire system of foundry practice, and yet, broad as the expression may seem, I mean every word of it. In outlining and establishing the foundry plant, the question of cost of plant must be considered in relation to value of output, as well as cost of receiving supplies and distribution of product. Cheap gas might induce the location of a plant in a locality where the only dividend would be gas.

In deciding upon the class and kind of stoves to be made, the cost of patterns must be carefully considered in relation to the quality and attractiveness of goods, as well as their adaptability to the purpose for which they are made, and their ability to compete on the line of progress with other makes. The stolen pattern may be cheap, but enduring prosperity seldom follows the pirate.

Having the plant and patterns, the cost of material and labor cuts a very important figure in placing a manufacturer in the line of success, and yet cost must be measured not only in price but in value received. How many of us

can testify to the saving of 50 cents per ton in the price of pig iron, and facing a loss of \$2 or \$3 a ton in the gangway.

The material purchased, the cost of labor is not always great because of high wages paid, when such wages produce more than lower paid help can accomplish; while it is equally true that high wages do not always guarantee profitable returns, therefore the greater necessity of measuring cost by results.

Having all these things, next is the cost of management, or superintendence. Do we ever make a change in this department because of salary paid? Or do we tire of paying a salary because we fail to get the desired results? If the latter, then cost of superintendence must certainly bear a just proportion to output or product.

Without going further, let us stop at the foundry door and treat only of the product ready for shipment, and leave the cost of selling for further consideration, because in this the merchant must take the place of the manufacturer, and when he does he only becomes a successful merchant when he can sell his goods at a price which will represent the three important factors of cost, selling expense and profit.

There is no other foundation upon which to build, and cost lies at the bottom, and this cost cannot be an aggregate or lump cost, but must be a specification, showing the individual cost of each article produced.

If your customer would buy from you a bill of goods consisting of:

1 base burner stove.....	\$30
1 round oak stove.....	18
1 cannon stove.....	10
1 box stove.....	6
Total	\$64

And because he had paid \$64 for four stoves, being an average of \$16 each, would make the selling price of each stove \$20, you would brand him as an idiot, and after he had disposed of the base burner and the round oak stove he would no doubt find out that you were right; at least, if he did not discover it you would when you attended the meeting of his creditors. And yet, foolish as this statement appears, it is no more foolish than the practice of the manufacturer who puts iron, sand, wages, patterns, mica, ash pans, postage stamps, &c., into his cupola, and then calls it all melted iron, dividing the cost by the number of pounds, and then again multiplying the weight of iron in the stoves he makes by the cost of iron per pound, without any regard whatever as to the relative value of all the different items entering into the cost of each separate stove.

I think that every manufacturer knows the cost of his product, if he keeps any books at all, just as a very estimable housewife once told me that she knew what it cost to keep house, because her husband gave her \$15 every Saturday and she spent it all and could get no more to spend. But in these times of competition it is necessary to know more than lump cost in order to learn which goods can be sold at a profit and to learn where saving can be made in the cost of manufacture.

It is because of my belief in the necessity of a practical knowledge of costs in detail, and because of the actual results obtained in the practice of determining a cost system in the business of the company whom I serve, that I plead for the more careful study of the subject, and trust that the facts which I may state in this paper may provoke a discussion leading to the

* Read at the convention of stove manufacturers held in Chicago, May 1, 1895.

further adoption of the cost formula prepared several years ago by the committee appointed for that purpose.

This committee gave to the work its most careful thought, and aided by the untiring energy of our lamented secretary, succeeded in securing its adoption in a large number of foundries, and I am pleased to learn from those who are using it that the results are a full compensation for all the labor and expense attending the work.

Value of a Cost System.

I do not think that there is room for an argument as to the value of a proper cost system, but I do think that we should lend our thoughts to the effort of simplifying our cost system so that it can be adopted by every foundry, whether large or small, and thereby secure a uniform system of figuring cost, which would without a doubt insure a uniform idea of value, and tend to a greater uniformity of selling price.

To this end I trust that every member of the National Association will, at this meeting, state fully the difficulty he may fear in adopting the formula, because I believe at the end of such discussion that your Committee on Costs can frame a plan which will fully meet the requirements of every member.

There are two classes of manufacturers, as there are two ideas of cost.

1. The one who wants to know his exact cost, and bases all his business upon it. For him there is nothing satisfactory but a system which will tell him facts, diversified and divided to any extent which may be necessary to the critical knowledge of every part of his product.

2. The one who does not care to know cost, which also includes the one who does not dare to know cost, and for his purpose imaginary cost is sufficient, and all his business is based on this system, the results of which are scattered all around us in demoralized prices and unnecessary addition to the value of goods without corresponding increase in price.

This second class of manufacturer thinks that he knows enough about cost when he imagines that he can sell his goods 5 per cent. below his neighbor because of some apparent difference in conditions. For instance, there are some founders who fondly imagine that their product, because it is made in a small foundry where the boss wheels his own iron to the cupola, must cost less than that made in a large foundry with a sufficient equipment of machinery; who, if results could be compared, would find that the percentage of unproductive cost as compared to the product was the larger in his case.

Again, they imagine that because they save the salary of a manager or superintendent their product costs less, but never stop to compare results obtained.

Yet again, they imagine that because they do not spend their money attending stove conventions they can afford to sell a larger stove than their neighbor for the same money.

I do not think that any of this latter class are ever quite satisfied that they are right, but they go on basing all their business on imagination because of their inability to compare cost with results, and for this reason I feel quite sure that no system, however simple, can be of service unless the diffused costs, which means all items that cannot be applied as specific parts of a stove, are so arranged that they may become a percentage addition to the known or specific cost.

The Percentage Question.

It has often been stated that the cost formula was not used because the percentage, as indicated in the examples shown, did not correspond with the experience of every member. The intention of the committee in publishing the examples in the cost formula was only to show the method of obtaining and using the percentage for foundry cost, and not to make a uniform percentage, because we found that by comparing results in different foundries the percentage would vary. But while this is true, the investigations made by D. M. Thomas during the past few years clearly demonstrate that the difference in foundry cost will not vary over 5 per cent. between any number of foundries, and to any one who will think of it this seems very reasonable.

To illustrate this is only one point: Suppose a small foundry makes only 1000 tons of castings per year. One of the partners is foreman in the foundry, another foreman of the mounting room, and each draws \$25 per week; the cost of management would be \$2600 per year, or \$2.60 per ton. Compare this with a foundry making 2000 tons of castings per year, who employ a general superintendent at \$2000, foreman of molding room, \$1200; foreman of mounting room, \$1200; total cost, \$4400, \$2.20 per ton.

Yet it very often occurs that the men in the first case named, because they do their own work, believe they are making goods at a less cost, and proceed at once to sell them at a lower price, to find out at the end of the year that they have not been able to make out of their business anything more than their wages, and that no more than they could have obtained for their services in any foundry, and without the risk and cares of conducting business.

Estimating Cost of Stoves.

The practice of estimating the cost of a stove can never be made of value, because the items which go to make up the cost are not all absolute and cannot be applied to that stove; in fact, there is not one item that can be called a fixed sum, and therefore a plan of applying a percentage which will cover all of the diffused or distributed cost is the only plan which will spread this cost over the entire plant.

If a foundry could be devoted to making but one thing or one size of stove, it would be very easy to determine by any method the cost of each stove produced. If there were 9600 stoves made in a year, and the foremen of molding and mounting rooms were paid \$1200 each, or \$2400 per year, then the cost would be 25 cents per stove, but when you attempt to divide the cost among stoves of all classes and sizes, it is simply impossible.

Now, if we suppose that the same foundry makes 9600 stoves of different sizes and styles, and that the value of iron, molding, mounting, bolts, urns, brick and other absolute items is \$28,000, then the cost of \$2400 for superintendence of molding and mounting room is 8.3 per cent.

Now, if the cost of labor and material is ascertained in each stove, no matter whether it is \$3 or \$30, when 8.3 per cent. is added, then that stove has borne its share of superintendence in just the same proportion as if they were all precisely alike; and at the end of the year the owner would find that his cost was provided for, instead of wondering why, after selling all his stoves at a supposed profit, he had nothing to show for it.

Illustrations could be multiplied to show the decided advantage of a percentage system, but I have never found any careful stove manufacturer who could dispute it, and therefore it seems to me that the subject to discuss is how to bring this system into general use, by making it so simple and flexible as to be adapted to the needs of every foundry, large or small. There must be a careful inventory, if true cost is to be determined, and the essential point in an inventory is to determine, in connection with the purchasing account, the exact cost of all material used.

If you find on hand at the beginning of the year 100 tons of pig iron castings at \$13 per ton, your account would show as follows:

On hand January 1, 100 tons at \$13.	\$1,300.00
Purchased during the year, 100 tons at \$12.....	13,200.00

Total, 200 tons.....	\$14,500.00
----------------------	-------------

On hand December 31, 90 tons at \$15.....	900.00
---	--------

Iron used, 110 tons.....	\$13,510.00
--------------------------	-------------

or an average cost of \$12.17 per ton. Now it does not matter what your cupola shows, or what your melter says, nor does it signify whether any of your iron was stolen or wasted; you have expended this amount of money for pig iron, and if you have purchased 1300 tons of perfect castings your cost of pig iron per ton of castings is \$10.40 per ton.

Starting with cost of pig iron, \$13.500, if we add cost of molding and mounting (the actual cost of pay roll), and all sums paid for nickeling, edge polishing, japsanning, mounting material, and every other item which can be made to apply to a particular stove, you will then have the fixed or absolute cost.

2. The main point is to determine the diffused or distributed cost, because this is the item which, if guessed at, will always produce errors in estimating prices, doubt in marking selling price and disappointment in profit at the end of the year.

It is safe to assume, and absolutely sure, that every dollar expended in your manufacturing department, other than the fixed items enumerated above, must be covered by adding them to the fixed cost before determining the selling price, or paid out of supposed profit, and when the total sum of money expended is ascertained, it is very simple to determine what relation it bears to the fixed cost and the proper percentage is found.

To follow the illustration from an entirely imaginary standpoint we will suppose that the absolute cost amounts to \$50,000; then if the general manufacturing expenses, which shall be the entire cost of manufacturing labor, superintendence, engine expenses, patterns, insurance, taxes, interest, repairs to real estate, &c., amount to \$20,000, the percentage of expense to be added to absolute cost on every stove would be 40 per cent.

Cost Register Book.

The book prepared by the committee was designed to be used and is very convenient for registering the cost of each stove, assuming that the books of the firm have been kept in such a manner as to obtain all items necessary to making up the percentage cost.

I think, however, that one of the main difficulties now seems to be the keeping of the account without great labor or expense, and believe it would be profitable for the association to prepare a book which should be a book of account, and which would only require

the entry of the items as they occur and simplify the account so that they could be used by any one.

It is presumed that in every business some one person has the final approval of payments, and under the direction of such person there would be no difficulty in having the entries made properly on the ledger.

For the firms who keep books by double entry it is entirely practicable to have all payments made by the proper officer and charged to an account called "Disbursement Account," regardless of what they are paid for. The bill or voucher, when approved, is marked for the department or item to which it should be charged and entered into a disbursement book, and at the end of the month the amount expended can be distributed by journal entry into each department account. I have placed on the secretary's desk a page from a book of this kind in use by our company, which reduces the work of dividing accounts to a very small item of labor, and yet has the strength of proof because the division of accounts must equal the entire amount of money expended if books are in balance.

For the foundry which keeps only simple books of accounts, a cost ledger, in which would be entered all money expended under three columns, one called absolute cost, the other called divided cost and the third called total cost.

This book on the desk of the book-keeper would make it easy for him to enter every payment at the time it was made, and at the end of the year, when the inventory was made up, he would have all the items needed to complete a cost account in a very short time.

Asking your pardon for the length of this paper, I can assure every member of the association, based upon the experience of our own company and supported by every firm who has adopted the cost formula, that the results obtained have in every case more than compensated for the cost and labor expended.

Obtaining Smooth Castings.*

BY W. HALES.

The question of how to obtain the smoothest face on castings is one that is not as easily answered as most foundrymen would like. There are many things to contend with which are perplexing even to the most experienced. To get a facing that is perfectly fire proof is almost impossible, owing to the nature of some iron and sand.

I have used iron that would (if improperly mixed) cut the best facing on the market, causing it to be condemned by those who thought themselves thoroughly acquainted with the business, when at the same time the fault did not lie with the facing, but with the man not knowing how to mix his iron. Then, again, I have seen foremen at sea with facing by reason of their sand being too open, not having enough body in it to hold the facing, being so open that both facing and sand would cut (or roll) before the iron, giving the castings a dirty appearance, as though so many worms had gone over the face.

A moderately close sand and a proper mixture of the iron will turn out a better looking casting with a medium facing than first-class facing, poor sand and badly mixed iron will do, the latter having a great deal to do in producing a smooth face on castings. A

foundryman had far better trust to experience than to knowledge gained from agents in regard to iron, sand or facing, or in fact anything in the business.

I prefer a good lead facing for first dressing, that is moderately pure—I say moderately, because it is impossible to get pure lead, it being mixed more or less with silica, iron, lime, alumina, &c., and also adulterated by the manufacturer. In second dressing, good charcoal, with a small proportion of good soapstone, ground together, will make a good return facing. The soapstone has a tendency to prevent charcoal from cutting, giving the casting a lighter and smoother appearance.

Some foundrymen use lime, others cement. Both are bad elements, and in either case will give the casting a rough appearance, but at the same time will stop the facing from cutting to some extent. I have used wheat, bean and pea flour with good results by shaking on after the mold is finished. The glutinous substance in the flour both molten and binds the facing, preventing it from cutting, leaving no bad effects, rough casting or bad marks, such as lime or cement will leave. Hard iron or iron improperly mixed will spoil a good facing. This is the cause in most cases. Get this right and the facing will be an easy matter to overcome. Iron should be mixed by analysis. Get a mixture that will give strength, face and color. Careful mixing will correct evils that are often supposed to be in the facing or sand.

I am a believer in both drying and bolting sand. There is so much vegetable matter in it that it sometimes works great injury to the face of a casting and should be taken out of it as far as possible. But the question arises, will it pay?

By the system that most foundries work under large quantities of sand are thrown into the gangway by the riddling process. In some cases it is wasted; others use it for the cupola bottom in place of new sand, and in my opinion it makes a better bottom; for, being mixed with the burned sand of gates and castings, it is rendered more open, allowing the gases to escape more freely than does new sand. My experience in drying sand is to place a quantity of heavy cast plates over flues in sand room, level with floor, put a moderate fire under them, throw sand over them and keep turning the sand to prevent burning. When dry, either roll or grind it; then screen it so as to get as much vegetable matter out of it as possible. This greatly assists in making a smooth face and also prevents loss of both sand and castings. Most of the loam and clay in the sand, after being dried or ground, passes through the riddle and is not wasted.

J. P. LINDEMANN & SONS, Milwaukee, Wis., are distributing among their friends in the trade a postal card calling attention to the New Gem gasoline stoves. Among other things the announcement printed on the back of the postal card says: "If you have not yet secured the sale of this celebrated stove and appreciate a specialty that is plastered over completely with patents and that your competitor can't get, you should lose no time in sending to us your name, with a request to send catalogues and prices." Lindemann & Sons are Northwestern agents for Dangler vapor stoves, made by the Dangler Stove & Mfg. Company of Cleveland, Ohio.

ODD PLATES.

THE NUMBER of foreign shipments of oil and gasoline stoves and of coal stoves of a character adapted to the requirements of what may be called tropical America is far greater than is generally known. It is claimed by some South American travelers that it would be found a profitable venture to send a competent representative salesman to this vast territory and deal direct with the merchants. The goods are now largely sold by importing and exporting houses as a mere incident in their general business, so that the foreign merchant does not come directly in contact with the American merchant and manufacturer. The advantages of such a business contact would be a more lively interest on the part of the American manufacturer and an increased confidence on the part of the buyer. It would enable the buyer to explain the special requirements which must be met to suit the peculiarities of his trade.

THE CLEVELAND FOUNDRY COMPANY, Cleveland, Ohio, have issued a neat catalogue devoted to their lines of lamp stoves and furniture for same. They state that their lamp stove furniture is interchangeable on their various lines of lamp stoves, and this important feature does away with the necessity of carrying so many lines of furniture in stock. Their pattern department is hard at work on new sizes and styles of register patterns, with which they are increasing their extensive line of these goods.

FRANK GROF, corner Seventh avenue and Eighth street, New York, makes a specialty of brass fire fronts and fire place trimmings. He either designs goods suited to finish and furniture of a house, or manufactures from special designs furnished.

WALTER S. STEVENSON and CLARENCE V. ROBERTS of Thomas, Roberts, Stevenson Company of Philadelphia, Pa., were granted on April 30 a patent for a design of a cook stove or range, among the special features covered being the elevated boiler shield, the front plate of the elevated warming oven, the door thereof and the lower warming oven door.

THE CARTON FURNACE COMPANY of Utica, N. Y., refer to the automatic electric heat regulator as a device which can be attached at small expense to any of the various heating systems. The apparatus is said to be free from complicated parts and requires no attention beyond winding once or twice a week. The company issue a fully illustrated and descriptive catalogue of the regulator, which they will forward for examination to those interested. The company are calling attention to this regulator by means of a neat folder printed in two colors.

LAZARD KAHN of Hamilton, Ohio, has assigned to F. & L. Kahn & Brothers of that place his interest in a patent recently granted for a gas stove. The device consists of a pair of vertical flues which are open below and form the end walls of an open front chamber. In this chamber is a gas burner, and over it is a horizontal pipe which connects the two flues mentioned. From this horizontal pipe and extending upward is also a radiating flue open at the top, while its base is in communication with the open front chamber. The stove is mounted on a leg base, and is surmounted by a hollow top or capital, having an outlet provided with a pipe collar.

* Read at the convention of stove manufacturers held at Chicago May 1, 1895.

WALTER S. STEVENSON of Thomas, Roberts, Stevenson Company of Philadelphia, Pa., has recently been granted a patent for a design for the front of a stove or hot air furnace, the special features covered being the top and side panels and the damper plate.

THE FOREST CITY STEEL RANGE COMPANY of Cleveland, Ohio, have recently been incorporated, with a capital stock of \$40,000. The incorporators are J. R. Couch, James E. Burdick, C. L. V. Evans, Norton W. Cope and John U. Helser.

THE CHAMBER OF COMMERCE BUILDING at Detroit, Mich., was opened last week with imposing ceremonies, a public reception being held in the afternoon and a banquet in the evening at the Hotel Cadillac. At the formal opening of the building the secretary read the historical sketch of the enterprise, which showed that the Detroit Chamber of Commerce was organized January 5, 1892, with 249 charter members, George H. Barbour being elected as first president.

THE MAY CALENDAR issued by the Joliet Stove Works of Joliet, Ill., is of the same general character as its predecessors. The blotting pad upon which the calendar is printed is embellished with a landscape scene and a marine view, together with some remarks relative to Moore's air tight heater. Special reference is made to 1895 pattern of this construction, which is said to be as far in advance of anything on the market as was the first Moore's air tight heater in 1891.

GEORGE WILLIAM GRAVES, 11 Chestnut street, Rochester, N. Y., issues a postal card calling attention to the concerns which he represents and the lines of goods which they manufacture. Special reference is made to the goods of Eugene Munsell & Co., Schneider & Trenkamp Company, the Steel Clad Bath Company and the Niagara Brass & Iron Works. The postal also gives a list of prominent dealers in Syracuse, Utica, Rochester and Albany, at whose showrooms samples of the Reliable gas ranges and gasoline stoves made by the Schneider & Trenkamp Company can be found.

A PRESS DISPATCH from Baltimore this week gives a horrid story of what was termed an explosion of a gasoline stove which resulted in injuries to a number of persons present. The "explosion" was described as happening in a "sweat" shop in that city. We have no knowledge of the facts of the case in this particular instance, but it strongly calls to mind an experience which we heard related not long ago. A person interested in the subject made an inspection of a number of buildings in Baltimore where fires from gasoline had occurred with unusual frequency. He found a number of stoves in use in sweat shops and on a visit to one of these places as he came from the room he noticed a small child carrying a basin in its arms filled with what appeared to be water. Theodor of the fluid, however, proved it to be something else, and investigation discovered that the child was carrying the supply of gasoline into the house for which he had been sent to a neighboring store. It need only be borne in mind that gasoline is highly inflammable; that its evaporation will be proportional to its exposed surface, and then the danger of carrying it into a house in an open basin, where very likely there is a fire of some sort about, will be readily appreciated. If that particular basin had caught fire and

resulted in the destruction of the building the newspapers would most likely have reported it as a "gasoline stove explosion."

THE CHICAGO & ERIE STOVE COMPANY of Erie, Pa., favor us with a copy of a pamphlet which they have just issued relating to various lines of Gas Helper ranges and heaters. Among the interesting features to which particular attention is invited is a canopy shelf which the company have just brought out, and which is so made that it can be attached to any of their gas ranges. In the back of the canopy shelf is a register opening connecting with the smoke pipe, for the purpose of carrying off the steam and odors arising from cooking operations. When the register under the shelf is closed the draft of the pipe is through the oven, the makers claiming that by this means the draft of the pipe may be adjusted either way, as desired. The company have also brought out for this season a water heater designed to take the place of water front in a range or cook stove, which may be used in connection with a range if so desired. The two sides and one end are made of two thicknesses of sheet steel with asbestos board between in order to prevent the radiation of heat. One end of the heater is cast iron and can be easily removed for the purpose of taking out the burner or reaching the coils, of which there are eight, composed of 1-inch pipe with $\frac{1}{2}$ inch connections. The "returns" on the water coil have "plugs" which can be opened to remove sediment from the pipes. The water heater has one large burner lighted by means of a pilot, and the makers state that a 40-gallon tank can be heated in one hour. Another novelty is the Gas Helper hot plate, fitted with four burners and intended to be placed on top of an ordinary wood or coal range for use in the summer months. It saves heating up the kitchen and can be removed at any time when the coal range or stove is needed for extra work. The 16 page pamphlet which the company have issued also shows an open front heater of nest design, known under the name of Invincible and intended for using both natural and manufactured gas. Various sizes of the Gas Helper range are shown and the pamphlet is likely to prove of interest to dealers generally.

THE HIGH VENTIL HEATER AND HEAT-REFLECTING COMPANY of New York has been incorporated to patent, manufacture and market heating apparatus, ventilators, reflectors, grates, &c., with a capital of \$50,000; the directors are: Spencer H. Hewlett of St. Louis, William Bryan of West New Brighton, William Langdon, John Cinnamon and Richard E. Van Ingen of New York City.

THE NOVELTY MFG. COMPANY of Jackson, Mich., are the assignees of a patent for an oil stove recently granted to Charles H. Boeck of that place. The patentable features consist in the peculiar construction, arrangement and combination of parts. The frame of the stove is of conventional design with an opening in the top. At the lower portion of the frame is supported an annular oil tank provided with a central burner tube which projects above and below the tank and which, with the tank, may be withdrawn laterally from the frame. Around the opening in the top of the frame of the stove is a depressed flange which supports a ring having short radial arms and which at the inner end carries a depending ring,

the latter having at its lower edge an inwardly extending flange. The lower end of the combustion chamber is provided with a cone which rests upon the top of the burner tube and forms a tight joint with it. The arrangement of parts is such that the combustion chamber may also be lifted out through the opening in the top by simply removing the inner griddle which supports the cooking utensil.

THE MICHIGAN STOVE COMPANY have issued another number of *The Garland Magazine*. This issue has a cover designed by Bradley, the famous Chicago designer of posters, which is printed in Gobelin blue on pale green paper. It is therefore a work of art which should be carefully examined when received. The magazine contains a great variety of articles calculated to amuse and interest every member of the family, including the musically inclined. The words and music of a waltz song, "The Roses are Blooming for You," are given. Scattered through the magazine are illustrations of some of the company's stoves, and the telling points of each are briefly enumerated. Both heating and cooking goods are shown. One who reads this magazine carefully will surely be converted into an enthusiast on the subject of Garland stoves and ranges.

ALBERT N. PARLIN of the Magee Furnace Company, Boston, arrived in New York late last week on the steamer "Columbia," from Southampton, England, and spent Sunday with John M. Sweeney, manager of their New York office at 242 Water street.

The Born Steel Range & Mfg. Company

of Cleveland and Galion, Ohio, have just issued from the press what is known as Catalogue F. It is a substantial volume measuring $7\frac{1}{2}$ x 11 inches, printed on heavy paper and bound in dark green paper covers with slide title in old gold. The goods illustrated comprise steel plate French ranges, broilers, carving and steam tables, pastry ovens, coffee and tea urns, laundry and tailor stoves, water heaters, &c. The volume is arranged with a great deal of care, and in connection with the illustrations is given ample descriptive letterpress so as to enable the trade to note the various features claimed for the goods. Among the more important points in connection with the steel ranges made by this company is the fire box, which is large and deep, ample direct flues, sectional top plate, drop oven door, top warming closet, oven bottom so made that all danger of warping is obviated and so simple in construction that any one can remove it in a few minutes without drawing the fire, and cased cement bottom which is used under the bottom flue. The body of the range is made of steel plate of heavy gauge, and in the ends and parts which are exposed to direct heat the plate is double thickness, with sheets of asbestos between, and all securely riveted together. The goods illustrated are made under the name "Born," and are adapted to meet requirements ranging from those of the small family up to the largest hotel. A feature of the catalogue are engravings representing the kitchen interior of a private dwelling and of the Kennard Hotel of Cleveland, Ohio. Complete kitchen outfits are considered in the closing pages of the volume.

TRADE REPORT.

The Iron Market.

The markets have been completely upset by the renewal of the labor troubles in the two valleys and the sudden outbreak in Chicago. The feeling in the trade seems to be that a higher range of wages is inevitable and that the buyer will have to stand the increased cost. So far the disturbances have been among the unskilled workmen, but it is evident that the Amalgamated Association is endeavoring to pull itself together in the West, and may succeed in causing widespread idleness a little later on. Even in works in which sliding scales are operative disappointment among the men at their slow upward movement may create trouble.

As regards the New York market, Northern furnaces have not yet advanced their prices, but they are doing a good business and find buyers more willing to pay the prices asked. We do not learn of any business at the advance for Southern Irons, which will have to wait until a higher level is reached by local Irons. The Lowmoor Company has advanced its prices 40¢ a ton, making their No. 1 \$13 and their No. 2 \$12. We quote \$12 @ \$12.50 for No. 1; \$10.75 @ \$11.25 for No. 2, and \$10.25 @ \$10.50 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.75 @ \$11 for No. 2; \$10.5 @ \$10.75 for No. 3; \$10.50 @ \$10.75 for No. 2 Soft, and \$10.75 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$10 @ \$10.25.

The Philadelphia Pig Iron market is reported in a very satisfactory condition from a seller's point of view. It is easy to do business at the old prices, and in some cases not difficult to get a small advance, but there is a considerable discrepancy in reports, and for that matter a considerable discrepancy in quotations. For the present Southern Irons are not in it alongside Pennsylvania Irons, prices for the latter remaining almost stationary, while the former are probably close on to 50¢ dearer. The result is that Southern Irons are not being sold to any extent, while Pennsylvania makes are very freely taken. It is understood that low priced contracts will all have expired by the end of next month, after which the higher cost of Pig Metal will necessarily involve a higher cost for the product. Sales have been on a large scale during the week under review. General quotations are as follows for Philadelphia and 30¢ @ 50¢ less for deliveries at points within 100 miles South or West:

Standard No. 1 Foundry X.....	\$12.00 to \$12.50
Standard No. 2 Foundry X.....	11.25 to 11.50
No. 2 Plain.....	10.50 to 10.75
No. 1 Soft.....	11.50 to 11.75
No. 2 Soft.....	10.75 to 11.00

In the Chicago market a healthy business has been done in local Coke Iron, but no large orders have recently been placed. An indication of the improved feeling is the occasional duplication of orders by recent buyers. Southern Coke has been comparatively quiet, yet a fair volume of business is reported. Lake Superior Charcoal ap-

pears to be moving in small lots only. Quotations are as follows, for cash:

Lake Superior Charcoal.....	\$13.00 to \$13.50
Local Coke Foundry, No. 1.....	10.50 to 10.75
Local Coke Foundry, No. 2.....	10.25 to 10.50
Local Coke Foundry, No. 3.....	9.75 to 10.25
Local Scotch No. 1.....	10.50 to 11.00
Ohio Strong Softeners, No. 1.....	12.50 to 13.00
Southern Silvery, No. 1.....	12.00 to 12.25
Southern Silvery, No. 2.....	11.75 to 12.00
Southern Coke, No. 2.....	10.50 to 10.75
Southern Coke, No. 3.....	10.00 to 10.25
Southern, No. 1, Soft.....	10.50 to 10.75
Southern, No. 2, Soft.....	10.25 to 10.50
Alabama Car Wheel.....	17.50 to 18.00
Jackson County Silvery.....	15.00 to 15.50
Other Ohio Silvery.....	14.25 to 14.50

In the Pittsburgh district furnacemen are asking about 25¢ more for their iron than a week ago. Foundry Irons are reported dull and neglected. Quotations are given as follows, for cash:

No. 1 Foundry.....	\$10.50 to \$10.75
No. 2 Foundry.....	10.00 to 10.25

A lull more or less pronounced has prevailed in the market for Pig Iron in Cincinnati during the past week. Buyers of Southern Pig have not followed the furnaces in the latest advance. Contracts for round amounts have been postponed, and orders for present delivery have been cut down to as low a point as possible. The market, however, is unsettled and new developments are expected at any moment. Taking into consideration the disposition of buyers and the attitude of sellers the volume of business has been quite satisfactory. No contracts embracing large amounts given on long deliveries are accorded, but the aggregate sum of small orders, for Foundry goods, Coke and Charcoal, Northern and Southern make, have been encouraging, as showing a fair industrial activity and a gradual increase in the smelting of Iron. Quotations are given as follows:

Southern Coke, No. 1.....	\$10.00 to \$10.25
Southern Coke, No. 2.....	9.50 to 9.75
Southern Coke, No. 3.....	9.00 to 9.25
Southern Coke, No. 1 Soft.....	9.50 to 9.75
Southern Coke, No. 2 Soft.....	9.00 to 9.25
Ohio Soft Stone Coal, No. 1.....	14.50 to 15.00
Ohio Soft Stone Coal, No. 2.....	14.00 to 14.50
Lake Superior Coke, No. 1.....	11.75 to 12.25
Lake Superior Coke, No. 2.....	10.75 to 11.50
Hanging Rock Charcoal, No. 1.....	11.00 to 11.50
Hanging Rock Charcoal, No. 2.....	10.50 to 11.00
Hanging Rock Charcoal, No. 3.....	10.00 to 10.50
Tennessee Charcoal, No. 1.....	13.00 to 13.50
Tennessee Charcoal, No. 2.....	12.00 to 12.50

The Pig Iron market in St. Louis is reported as being quiet. Most of the large consumers have their wants already supplied and the smaller trade are in much the same condition. The month of April was without doubt the best month so far as volume of business is concerned that any of the local agents have experienced for at least four years past. Notwithstanding the absence of any large business, prices are firmly maintained and furnacemen refuse to shade prices as quoted below. Efforts have been made to secure lower prices for good round lots, but they did not succeed. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry.....	\$10.25 to \$10.50
Southern Coke, No. 2 Foundry.....	10.00 to 10.25
Southern Coke, No. 3 Foundry.....	9.50 to 9.75
No. 1 Soft.....	10.00 to 10.25
No. 2 Soft.....	9.75 to 10.00

THE MISSOURI BRASS TUBE FOUNDRY COMPANY of St. Louis have filed articles of incorporation; capital stock, \$50,000; incorporators, C. A. Mennel, W. J. Kenefik, Frank Lehoag.

Metal Market.

Pig Tin.—Wholesale prices for both prompt and future deliveries have been carried higher during the week. It was only where special conditions, such as right of seller to double, that deals up to and including July delivery were made at less than spot price. Still, out of town trade has been accommodated at prices remarkably close to official quotations, and there is other evidence that some prominent holders have been quietly unloading Tin while not only supporting but nursing the higher level of values. Speculation otherwise has been moderate and mainly in the form of closing out old deals between prominent operators. Market gossip has it that there is a considerable short interest here and in London, and deliveries on contracts thus far this month, it is also noticeable, have been well taken care of. Behind this is the substantial fact that prices have been raised in both markets, in the face of what is considered a bearish statistical position. Jobbing business has been of very fair volume, while prices for small lots from store had advanced, in sympathy with the wholesale market, about $\frac{1}{2}$ ¢ lb, the current retail quotations being 15 $\frac{1}{2}$ ¢ for Strats Pig and 16 $\frac{1}{2}$ ¢ a 17¢ for Bara. Banca, in small lots, rules at 16 $\frac{1}{2}$ ¢ lb.

Copper.—An advance in price of Lake Ingot of about $\frac{1}{4}$ ¢ lb has taken place in the wholesale market, with a corresponding rise in Electrolytic and Casting stock. Speculation is accountable in a measure for the rise, but the substantial fact remains that consumption is heavy and that deliveries on contracts, while quite free, are well taken care of. There is an impression in the trade that late "bears" have turned "bulls," and there is some indication also that they have been instrumental in raising prices. Retail business has been quite fair, with good inquiry. While prices for small lots of Ingot are not notably higher, they are very firmly held and are expected to be advanced if the present rise in raw material here and abroad is maintained. Small parcels of Lake Ingot from stock rule at about 10 $\frac{1}{2}$ ¢ lb.

Sheet Copper.—The demand for manufactured Copper has displayed a considerable increase. Some good contracts have been placed within the week for Cornice Copper, and several heavy orders for this material will, it is believed, shortly materialize in this section. Consumers are evincing more interest in purchasing and inquiries are more frequently followed by actual business than has been the case of late. The outlook for a good summer business is regarded as bright. The probability of an early advance in the price of Manufactured Copper is discussed with considerable interest. Quotations on small lots of Sheet Copper from store are as yet unchanged at the net list rate of 14 $\frac{1}{2}$ ¢ lb.

Pig Lead.—Buying has been somewhat larger and chiefly by prominent consumers not far distant from cor-

roders. Naturally they kept as much pressure as possible to bear and dealers acted more or less in harmony. Prices for Common Western, both for prompt and future delivery, are, however, still at the same low level. The home consumption, by all accounts, is quite heavy, but export business is not as prominent a factor as it was a short time ago. Small business has been fair, with prices for moderate sized lots of American Pig from store unchanged at 33¢ @ 34¢ $\frac{1}{2}$ lb.

Lead Pipe and Sheet.—More favorable reports are gathered from the plumbers' supply trade than have been offered for some time past. All the factories are busy and orders are booked ahead for the coming two months. Inquiry is very active, and the indications are that stocks are being generally replenished. The present activity in the building trade in this section promises a large and increasing business in manufactured Lead in the coming months. Prices in this section are maintained on the list basis of 54¢ for Pipe and 54¢ for Sheet Lead, subject to a discount of 20 %.

Splter.—There has been more business, chiefly in carload lots for early delivery, and prices have hardened somewhat, although showing no radical change. Consumption is reported as being heavier, not only in the Galvanized Iron trade, but in Brass manufacture. Prices for small lots from store are steady at 34¢ @ 4¢ $\frac{1}{2}$ lb. for good Western brands.

Antimony.—Aside from ordinary jobbing movement there has been little doing and prices are still rather soft at about 8¢ for Hallett's and 9¢ for Cookson's, in small lots.

Solder.—Demand has been fairly brisk, while prices have advanced in sympathy with that of Pig Tin. Small lots are quoted at 14¢ for $\frac{1}{2}$ and $\frac{1}{3}$ guaranteed, and 9¢ @ 10¢ for No. 1.

Sheet Zinc.—A notable flurry has taken place in the market for this material within the last few days, owing to the increase in the volume of demand from consumers. Stocks in the hands of dealers have been allowed to run very low in the last year or two, and the sudden expansion in demand caught them in a condition of unreadiness to meet it. The supplying mills also seem to be short of stock, and it is said that one has been obliged to send to this city for a considerable quantity of Sheet Zinc of their own manufacture in order to meet a pressing order received at the mill within a day or two. Prices have advanced sharply, a rise of 3¢ $\frac{1}{2}$ lb having been made by the producers on Thursday. The advance in jobbing prices has been still larger, it being difficult to obtain 600 lb casks under 54¢ $\frac{1}{2}$ lb, while it is found utterly impossible to fill any orders of large size. Small broken lots from store rule at about 6¢ $\frac{1}{2}$ lb. Whether the advance will be permanent or whether it is merely a temporary flurry remains to be seen; but it is hardly thought that the present prices can be maintained after stocks are again filled up.

Tin Plate.—In the wholesale market a better business has been done in Cokes for future delivery. Spot sales of both Cokes and Charcoals have also improved to some extent. The movement of large business, however, is still only moderate, and hardly up to what might be looked for at this time of the year after the dullness experienced last month. Distribution has been, however, considerably larger in the retail

trade, where the aggregate of moderate sized orders has reached a very respectable volume during the week. Roofing Plates, both American and imported, have secured a considerably larger demand, and inquiry for all descriptions of Plates is noted by the jobbing houses to have been larger than for some time past. The outlook for business in Roofing Plates within the next month or two is held to be extremely good. The reduction in stocks abroad has caused a stiffening in the market for Welsh Plates, which is beginning to be felt in this market also. Stocks of imported Plates are not at all excessive, and the assortment is quite poor, a number of special sizes being almost entirely out of the market. American brands are, however, being offered in considerable volume, and at prices which compete successfully with foreign material. The market at the close of the week showed a better tone than it has displayed for the past two months, with prices firm at last week's quotations.

A special cable dispatch from London, dated May 8, to *The Iron Age*, reports on the British Tin Plate market as follows: Tin Plate has been steadier in price, but business has continued slow, and dealers are still cautious and purchase only for immediate wants. Offers are more plentiful, with rather higher rates in some instances, but the quantity of Plates booked was small, owing to curtailed production and light stock. Quotations, f.o.b. Wales, are as follows: Bessemer Cokes, 10 14 x 20..... 9/ @ 9/3 Siemens Cokes, 10 14 x 20..... 9/4 @ 9/2 Terns, 20 x 28..... 11/ @ 11/6 Charcoals, 10 14 x 20..... 11/ @ 13/6

Sheet Iron.—The activity in the demand for Black and Galvanized Sheets, referred to last week, has continued, and prompt shipments are almost impossible to be had from any of the mills, many of which are said to be filled up with orders as far ahead as July 1. Some of the leading manufacturers are not inclined to quote prices on Galvanized Sheets, but no increase in price has been agreed upon by the mills as yet. The jobbing demand for Galvanized Iron from the smaller roofing trade is larger than for a long time. Prices are held quite firmly, small lots of No. 27 Common Iron being quoted at \$2.70 @ \$2.75 $\frac{1}{2}$ lb Galvanized Sheets rule at 75 % and 5 % @ 75 % and 10 %, according to size of order and conditions of delivery.

Chicago Report.

Scrap.—Business has recently been less active in this vicinity. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton. Per lb
No. 1 Wrought Scrap.....	\$6.50
Machinery Cast.....	5.50
Malleable Cast.....	5.00
Store Plate (free of burnt).....	4.00
Burnt Iron and Grate Bars.....	3.00
Sheet Iron and Hoops.....	2.00
Plow Steel and Breaking Stock.....	4.00
No. 2, such as Shovels, Hoes, &c.....	3.00

CONDITION OF THE

Hardware Trade.

THE MARKET continues in about the same general condition as for the past week or two, but it is evident that there is a somewhat improved feeling in regard to the outlook for business. Trade is very fair in volume, and while merchants as a general rule are not disposed to buy beyond their requirements there are some lines of goods which are regarded as a safe purchase, there being, in the judgment of experienced parties, more probability of an advance than a decline. This has some effect in giving the market a better tone. It is also noticeable that prices on some goods are a shade firmer, and that the changes which are being announced are nearly always advances rather than declines. While these changes are not very important they are significant as indicating the tone of the market. In some lines of goods, especially seasonable articles, there is some delay on the part of manufacturers in filling rush orders, and on some staple goods the stocks in manufacturers' as well as merchants' hands are light.

Advices from Chicago.—The Shelf Hardware jobbers report a remarkably heavy trade now in progress. The copious rains which have recently prevailed through the West have done a great deal to improve the situation, as they have encouraged the farmers everywhere, and also caused dependent interests to look up considerably. The hot weather of the past week has also caused season goods to move much more freely. All kinds of summer goods are now in active demand, and stocks in jobbers' and manufacturers' hands are moving off rapidly. A feature of the situation is the improvement in mail orders. Merchants cannot wait for traveling men to visit them. They are in need of goods to meet the actual demands of their customers. Prospects are brighter than ever, many new stocks being in sight, and a disposition being shown by the established trade to anticipate wants for a reasonable time. The Tin Plate trade is very much better. The most important change in prices recently made is in Wood Screws. Manufacturers have advanced their printed prices to 87 1/2 per cent. The jobbers will probably make their bottom price

85 and 20 off. Important Government contracts for Indian supplies will probably be awarded in this city during the coming week. Competition for these contracts was vigorous and the result is awaited with much interest.

Notes on Prices.

Wire Nails.—As referred to in our last issue, the Wire Nail market is characterized by an improved tone. No conclusion has been reached in the negotiations with a view to improving the general situation and giving the market more regularity than has heretofore characterized it. The matter is still under advisement and some who are closely identified with the movement are hopeful that it may be successful. In the mean time the trade are purchasing quite freely, though there is little of the speculative element in it. Buyers are watching the market closely, so as to be in a position to place orders if there should be a marked tendency toward better prices. Manufacturers, on the other hand, are refusing to accept orders except for early delivery. Small lots from store are held at \$1.10 to \$1.15.

Advices from Chicago.—Manufacturers have enjoyed a very heavy trade since our last report. The situation has so decidedly improved that there are now very few sellers at the old basis for factory lots. Jobbers have advanced their prices to \$1. Joliet, for carload lots. This ends the long contest on Wire Nails, which began early in January.

Cut Nails.—The Eastern Cut Nail market continues as at our last report. The prices agreed upon by the manufacturers are quite well adhered to. They are as follows for small lots, on dock, 90 cents, and from store, in New York, 95 cents, the above quotations all being made on the basis of 60-cent average, with an advance in the base price where the average is less. The volume of business is fair, and the trade are anticipating that it may continue steady for some time.

Advices from Chicago.—The situation shows no change. Manufacturers report a continued fair trade running to moderate sized lots only. Small lots from stock are held at \$1.

Barb Wire.—The Barb Wire market is without change so far as prices are concerned, the quotation of \$1.80 for carload lots of Four-Point Galvanized at mill being a representative one, though concessions are sometimes made on attractive orders. An excellent demand is reported and the factories are making heavy shipments.

Advices from Chicago.—A much larger business has been done the past week, and second orders are now coming in from buyers in many portions of the territory covered from this district. All factories are extremely busy and are falling behind in their shipments. Quotations are unchanged. Small lots from stock are held at \$1.60 for Painted and \$1.95 for Galvanized.

Screws.—The Russell & Erwin Mfg. Company, New Britain, Conn., and New York, have issued under date May 1 a circular giving advanced prices on Wood Screws, the same as those announced in our last issue by the American Screw Company. The revised discounts are as follows:

	Discount per cent.
Flat Head Iron	87½
Round Head Iron	82½ and 10
Flat Head Brass	87½
Round Head Brass	82½ and 10

Flat Head Bronze Metal	82½ and 10
Round Head "	80 and 10
Flat Head Iron Screws, Blued, 5 per cent. advance on net.	
Patent Diamond Point, Oval Head, ...	87½, 10 and 10
Patent Diamond Point, Flat Head, ...	87½ and 10
Patent Diamond Point, Round Head, ...	82½ and 10
Flat Head, Nickel Plated on Iron	75
Round Head "	72½
Flat Head, Nickel Plated on Brass, ...	66½ and 6
Round Head, Nickel Plated on Brass	66½

The trade will be pleased to note this further indication of improvement in the condition of the Screw market, which is undoubtedly characterized by better tone than a few weeks ago. The American Screw Company and Russell & Erwin Mfg. Company are the only manufacturers who have up to this writing announced advanced prices.

Sea Green Roofing Slate.—John Galt & Sons, 253 Broadway, New York, are issuing a card of the prices for No. 1 Sea Green Roofing Slate, in carloads, adopted by the Vermont Slate Company on May 2. The prices, which are subject to change without notice, are as follows:

28 x 14	22 x 14	
22 x 11	16 x 12	
30 x 11	16 x 10	\$2.75
30 x 10	16 x 9	
18 x 10	14 x 12	
	16 x 8	
26 x 14	14 x 10	
24 x 14	14 x 9	\$2.25
24 x 12	14 x 8	
20 x 12	12 x 10	\$2.65
18 x 12	14 x 7	
18 x 11	12 x 9	
18 x 9	12 x 8	\$2.00
	12 x 7	

Spray Pumps.—In our issue of last week we illustrated a new line of Spray Pumps which F. E. Myers & Bro., Ashland, Ohio, are putting on the market. These Pumps are sold from the following list, subject to a discount to the trade of 55 per cent.:

Barrel Spray Pump, with strainer, agitator and air chamber	\$11.50
Imperial Brass Spray Pump	5.50
Knap sack Sprap Pump	5.50

Mop Holder.—The Arcade Mop Holder, described in *The Metal Worker* of 4th inst., and put on the market by the Arcade Mfg. Company, Freeport, Ill., is sold to the trade at \$1 per dozen, net.

Conroy Fastener.—The new automatic Refrigerator Door Fastener, manufactured by P. J. Conroy, Paschali, Philadelphia, Pa., is sold to the trade from the following list, subject to a discount of 40 per cent.:

Ornamental.	Highly Polished.	Nickel Plated.
Per dozen.	Per dozen.	Per dozen.
103.....\$12.00	\$14.00	\$15.00
104.....9.00	10.00	11.00
105.....7.50	8.00	9.00

Palm Oil.—The recent increase in the demand for Palm Oil for Tin Plate manufacturing purposes has caused a stiffening in the price of this product. The standard brands now in the market, with their prices, are as follows: Fancy Lagos, 5½ cents; Clarified Lagos, 5 cents; Accra, 4½ cents; Half Jack, 4½ cents per pound, in casks of about 1500 pounds.

Old Metals.—Business is fairly good, but enough material is offered to prevent any quotable advance in prices. Scrap Iron in this section has shown more activity during the past two or three weeks and higher rates are talked about, but have not yet materialized

in quotations. Dealers' purchasing prices for moderate sized lots, New York or Jersey City delivery, are about as follows:

Heavy Copper	7¢
Light and Tinned Copper	6¼¢
Heavy Brass	4½¢
Light Brass	3½¢
Lead	2½¢
Tea Lead	2½¢
Zinc	2½¢
No. 1 Pewter	10¢
No. 2 Pewter	5½¢
Wrought Scrap Iron, gross ton	\$7.50 @ \$8.00
Heavy Cast Scrap	gross ton 7.50 @ 8.50
Stove Plate Scrap	gross ton 5.00
Burnt Iron	gross ton 3.00

The Boom in Wall Street.

During the past week or two the attention of the business world in this country has been irresistibly attracted toward Wall street. The stock market, after two years of almost unexampled dullness and depression, has suddenly sprung into exuberant life and activity. Prices of securities have shot up in a remarkable manner, and the volume of speculation and investment business recorded day by day has, in some cases, exceeded anything of its kind known in this market for a number of years past. The responsibility for this change in the aspect of American securities is due mainly to enthusiastic purchasing by foreign investors. Nevertheless, a vast amount of domestic speculation has also figured in the market. Business, however, has been by no means confined to speculation simply, as a very large amount of sound investment buying is recorded. The return to subscribers of 40 per cent. of the amount paid out by the syndicate of bankers who purchased the \$62,000,000 of Government gold bonds three months ago has thrown a vast sum of available money on the market, which is now loaning at about the cheapest rates ever known. Naturally a considerable proportion of these funds finds its way into speculative business on the Stock Exchange, and this, with the other favorable occurrences before referred to, has sufficed to create the boom which has taken place on "the street." It is said that over \$80,000,000 of American stocks have already been placed abroad, and the appetite of English investors for "Americans" is by no means yet satisfied. A continuance of this movement will go far toward making up for the \$300,000,000 of our stocks and bonds which were sent back from abroad during the late depression. How long this activity in speculation will be kept up it is diffi-

cult to guess at. Some authorities assert that this is only the beginning of a revival in values which will continue through the summer. Others, on the contrary, incline to the opinion that the current boom is likely to be transitory, and that the present high tide will subside again before long. It should not be lost sight of, however, that there are a number of favorable features in the present situation which may very probably operate toward a maintenance of the present range of values in our securities. Railroad earnings are beginning to show a very decided improvement. Industries are resuming operations on every hand and are rapidly giving employment to the idle. Prices of staples, as well as of many manufactured products, are all tending toward higher levels. Wages are being advanced in many industries, and a comparison of the returns of bank clearings show that the general trade movement in the country is making very considerable advances. On the whole, it may be said that a general and substantial improvement in the business situation has set in, which, provided no unforeseen calamity, such as failure of crops, intervenes, should carry the country to as high a level of prosperity as it has ever reached before.

The Philadelphia Commercial Museum.

There has been established lately in the city of Philadelphia a municipal institution, under the name of the Philadelphia Economic and Commercial Museum, which in its scope and usefulness is of more than local interest. The museum, which is a purely public institution, is under the direction of a board of trustees appointed by the city. The personnel of this board is a sufficient guarantee of recommendation, including as it does some of the most influential and respected citizens of the Quaker City. The principal officers of the board are William Pepper, M.D., LL.D., president; Charles H. Cramp, vice-president; Clarence H. Clark, treasurer, and William T. Wilson, Sc.D., secretary and director of the museum. The declared aim and object of the museum is to further the interest of the American manufacturer and consumer, and in general to build up our foreign commerce. Its work includes the collection of natural products from all the countries of the world which have already entered our markets or which may be made available for them, together with samples of manufactured products from foreign countries which may serve as aids to our own manufacturers. The most important parts of the exhibits

from Mexico, Central and South America, Australia, South Africa and many Asiatic countries, at the World's Columbian Exposition, were, at its close, removed to Philadelphia, and they form the nucleus of the present collection. These exhibits, renewed and further extended, are to be permanent features of the museum; and similar products from all other countries are being rapidly added to the collection. In order to secure the best advantages for the American manufacturer and consumer these products are brought before them so that they may make the best selections of material for their own special interests.

A Boon to Manufacturers.

The directors of the museum propose further to publish all possible scientific and useful information concerning these products which may aid the manufacturer and consumer in their choice. A bureau of information has also been established, whereby useful information is furnished concerning all markets which it is thought our merchants and manufacturers can enter or control. Detailed information as to source, cost of production, selling prices, import duties, manner of packing, patent rights, &c., will also be furnished; and through the publications of this department co-operation and exchange will be effected with the leading commercial, scientific and educational museums of the world. The leading feature of the undertaking is the establishment of special periodical exhibits in various fields of trade manufacture. At the present time there is being displayed an exhibit of foreign wool, which is creating great interest among the members of the wool trade in the United States. The next large exhibit will be the hard woods of the world, which, it is said, will embrace the largest permanent collection of woods ever brought together.

According to recent European dispatches, M. Paschal Grousset has made a singular proposition in connection with the International Exposition, to be held in Paris in 1900. It is the digging of a pit 1500 meters deep, from which point borings would be made to the depth of another 1500 meters, with a view to ascertain if the center of the earth contains a large supply of stored up heat. This idea has caused a great deal of talk in Parisian scientific circles, and Professor Munier-Chalmas, director of the Laboratory of Geological Research at the Sorbonne, and M. Marcel Bertrand, lecturer at the Ecole des Mines, who are among the most eminent geologists of France, have declared themselves as distinctly favorable to the scheme.

THE LETTER BOX.

Expansion of Metals.

From A. H. J., *Beauford, S. C.*—Please answer the following questions in the Letter Box: What metallic wire is most susceptible to expansion and contraction during changes of temperature, and to what extent does the contraction go (costly metals not considered)? Given a wire of most susceptibility $\frac{3}{16}$ inch in diameter and 100 inches long at 100° F., what contraction would take place for each 10° reduction in temperature down to 30° F.?

Answer.—The common metal that has the most expansion and contraction is zinc, but we do not know whether our correspondent's purpose would be fulfilled by using a zinc wire. The expansion for each degree Fahrenheit in a zinc wire 100 inches long would be $\frac{1}{1000}$ inch, and as the ratio is constant, for 10° it would be $\frac{1}{100}$ inch. So in a wire 100 inches long at 100° F. the contraction would be to $99\frac{9}{100}$ inches at 90° F., $99\frac{8}{100}$ inches at 80° F., while at 30° F. it would be $98\frac{7}{100}$ inches. Lead wire has about the same expansion as zinc, being a trifle less. If, however, it is desired to use one of the hard wires, the greatest expansion is found in brass. In a brass wire the expansion is $\frac{1}{1000}$ inch in 100 inches for each degree of temperature. For each 10°, therefore, the reduction in length as the wire was cooled would be $\frac{1}{100}$ inch.

Is It Sanitary?

From H. B. J., *Birmingham, Ala.*—In reference to sketch of plumbing work submitted by "B. C. H." in *The Metal Worker* of May 4, I would say that there is nothing sanitary about it. In the first place, it should be back vented to take the back air out 6 inches above the urinal. Secondly, the stack of soil pipe should be carried through the roof the full size, which is 2 inches. As for its siphoning, it will not do so as long as the stack continues through the roof. Even if the regulations in any city should not require that the fixtures be back vented if they are within 5 feet of the stack, any sort of a plumber ought to know better than not to do it.

Quick Running Solder.

From H. O. I., *Kentucky.*—Please tell me how to prepare a quick running solder that I can use for soldering block tin.

Answer.—We believe the solder used for this purpose consists of the ordinary soft solder, to which is added a little bismuth. The proportions are variously stated; one formula which we have seen gives tin two parts, lead one part, bismuth one part. Sometimes, however, the amount of bismuth is increased up to as much as three parts.

A Balky Furnace.

From A. H. P., *Detroit, Mich.*—In answer to "J. H. W.," who makes an inquiry in *The Metal Worker* of April 20 as regards the solution of a balky furnace problem, I would suggest that, as he cannot change the location of the furnace, he could get good results by following the directions I have marked on the sketch. One objectionable feature of this job is that the pipes all run from one side of the furnace; and then, according to my ideas, his pipes which run to down stairs rooms are too small. I have marked the sizes which I would use and the sizes of registers. I think he will find it a very easy matter to run his furnace to the satisfaction of all

upward, so that it will run to the ceiling of the kitchen, where it should turn down and run to the boiler, connecting it at the top of the hot service. This method of piping will enable the water in the water back to escape to a higher point when it has become hot and make room for the water to flow into the water back from the boiler and thus start a circulation. If he desires a good circulation he should have a large water back and at least a 1-inch pipe and small boiler. The 1-inch pipe should be connected straight to the boiler, the hot water service pipe being taken from a T in the pipe. This method of piping is used often in hot water fitting when a stack of indirect radiation is located at some distance

A Balky Furnace.

concerned if he will return exhaust ducts from the hall, library and parlor, with the registers located as I have marked them on the sketch, and with pipes of the size shown.

Kitchen Boiler Below Range.

From SYPHON, *Newark, N. J.*—I notice the communication of "P. S. J." in *The Metal Worker* of May 11, and would advise that he find some place in the kitchen for the boiler. It is unreasonable to expect a plumber to supply hot water to a building unless he has a fair chance. It is unnatural for water to circulate freely through such a system as he has shown, and if a circulation can be started it will not be that free, frictionless circulation which will be inexpensive and satisfactory. As he requires help, however, I will make the suggestion that he disconnect the pipe from the side of the boiler and put a plug in the opening. The hot water pipe from the water back should turn

from the boiler and almost on a level with the top of it. In hot water heating an air valve is placed at the top of a siphon, but if any considerable pressure of water is carried on the system the air will be carried out of the siphon when hot water is drawn. In order to prevent the siphon becoming air bound it will be best to place an air valve at the top of it. If the siphon reaching to the ceiling does not secure the circulation it may be necessary to run it up higher. A rule for calculating the siphon height is to provide twice the head above the boiler of the drop to the fixture below it. Another method of piping would be to run the hot water service pipe from the boiler up along the side of the range to supply the second floor. Then the flow pipe from the water back may be connected into this pipe, avoiding the necessity of an air valve. The pipe from the water back to the boiler should be 1 inch in size, but the hot service pipe may be reduced to $\frac{3}{4}$ inch, or the size of the other service pipes, after

leaving the water back branch. The theory of the circulation in cases of this kind is that as the water in the pipe from the water back becomes cool from exposure it has no tendency to ascend, but rather to fall to the boiler, when the water rises in the other pipe to the water back and circulation is started. Such rapid circulation can never result, however, as when the water back is made the lowest point in the system, so that the cooler water will continually fall to it, forcing the hot water to rise.

From H. H., Boston, Mass.—I notice in *The Metal Worker* of May 11 the inquiry of "P. S. J." regarding a kitchen boiler below range. He does not say whether the system is supplied from a tank or from the city main. However, I will suggest, first, that the hot water supply from the range to the boiler should be fixed near the top of the boiler, say about 2 inches below the rivets; second, the system should be under city pressure, using a check valve in the cold water supply to the boiler and an expansion pipe from the top of the boiler, with a safety valve attached. Then the pipes and boiler in the basement should be covered or incased. His customer must not expect as good a supply of hot water as where the boiler is above the range; and he may also expect a little hammering on account of steam and vacuum occurring occasionally within the water back.

Dripping Pan Corners.

From A. W., Watertown, N. Y.—In answer to "A. C.," Milwaukee, Wis., who asked for a method of obtaining

Dripping Pan Corners.—Fig. 1.—Method Suggested by "A. W."

patterns for dripping pan corners, I would suggest the following: After laying out the lines for the bottom and sides of the dripping pan, with the gauge mark around the edge denoting the width to turn over for the wire and the miter line drawn through all the corners, set the dividers to the flare required. For example, if the pan is to be $\frac{1}{4}$ inches larger at the top than at the bottom let the dividers spread $\frac{1}{4}$ inch, and with A as center mark the point with a small arc on the gauge line, as shown at B of Fig. 1. From B draw the short beveling line through that part which is allowed for wiring. This is the mark on which to "notch in" for the wire. After all of the four corners have thus been laid out, draw a line at one of the corners from B to C, as indicated by the dotted line. Now, with the dividers set indefinitely, but less than the depth, and with C as center, describe a quarter of a circle commencing at the original miter line, as at D. Set the dividers from D to E,

swinging them around, and with E as center mark the spot on the quarter circle, as at F. Draw a line through this point from C, as indicated by the dotted line C F G. Now set the dividers upon C and spread them out to the point where the last dotted line intersects the gauge line at G. Swing them to the left and mark the spot upon all of the horizontal miter lines. This we will call H. There is nothing left to do but draw the lines from B to H on both sides of the original miter line, but in doing this, although the point H is correct theoretically, it is necessary to make a little allowance for shrinkage, caused by the doubling up of the iron or tin when the corners are turned. Therefore, the two lines from B intersect the original miter line a little outside of the point H, as shown in the drawing.

From W. N., New York City.—Replying to the correspondent "A. C.," Milwaukee, Wis., I desire to submit a method which is very simple and at the

Fig. 2.—Partial Elevation of Pan of Given Flare Accompanying Letter of "W. N."

same time accurate. In Fig. 2 let A B C D represent part of an elevation of a dripping pan with the flare indicated by D F. Having obtained the pattern for the corner so that when folded it will lie parallel with the wire, proceed as follows: In Fig. 3 let A B C D represent the bottom of the pan. At right angles to A B and A C lay off the stretchout of the flare D F in Fig. 2, as shown by E F and G H in Fig. 3. Through the points F and H and parallel to A B and A C draw lines, as shown by P K and K R, which intersect at K. Draw the diagonal line K A. Now extend the lines C A and B

Fig. 3.—Pattern for Dripping Pan Corner Submitted by "W. N."

A until they intersect the lines P K and K R at the point I and I'. Now take the distance of the projection of the flare shown in Fig. 2 by F E and place it as represented in Fig. 3 from I to J on the line P K and from I' to J' on the line K R. Connect the points J A and J' A, which will represent the miter lines, which will join together when the corner is folded. Now, with A as center and the diagonal line A K as radius,

describe an arc, as K L. Then, with J as center and J K as radius, describe an arc intersecting the one previously drawn at L. Make a line from A to L, intersecting the line K P at the point N; connect L and J. Then will the dotted triangle A J L represent the position of the corner if bent on the line J A and will project over the wire. In order that it may be parallel to the wire take A in Fig. 3 as a center, and with A N as radius describe the arc N O until it intersects the diagonal line K A at the point O. Draw a line from J to O and from O J'; then will P J O J' R C A B D represent the pattern for the corner corresponding to the flare shown in Fig. 2 of the sketches.

From F. M. C., Newark, N. J.—I submit a sketch, Fig. 4, and a description of a method of laying out dripping

Fig. 4.—Diagram Submitted by "F. M. C."

pan corners, for the benefit of "A. C.," who asks for assistance in *The Metal Worker* of April 23, and also for the benefit of the many other fellows who are struggling to make a living. Let the line 1 represent the top of the pan and the line 2 the bottom. The line 3 shows the flare. In making the pattern lay out the size of the bottom, shown by line 2; then add the height for the pan, as shown by the line 1. Lay out the flare for the corner, as shown by the sketch, by taking a bevel and placing one edge on the line 1. Adjust the other edge of the bevel to the line 3 very accurately. After setting the bevel, turn it over and again place it on the line 3, drawing the line 4, as shown. Add width enough to the line 1 to cover the wire which is used to stiffen the edge. This method will give a correct pattern, and is one which I have worked out and never found to fail, no matter what the flare or depth of the pan may be.

Gasoline Insurance.

From D. F. L., Montgomery Station, Pa.—I am glad to see the question of extra insurance for the privilege of burning gasoline in stoves taken up in *The Metal Worker*, as it is a matter of considerable importance to the gasoline stove trade. My customers—some of them, at least—are paying extra premium. I am myself doing the same for the privilege of burning gasoline in a soldering furnace in the shop. One agent asked me \$5 extra and another insured me for \$2.50 extra, which, in my opinion, is unjust. I hope the dealers in gasoline stoves will give this matter their attention, as it certainly does interfere with the sale of these goods.

Polishing and Buffing Machine.

In the polishing and buffing machine made by the Appleton Mfg. Company of Philadelphia the head is so designed that when used as a bench machine it may be belted to a countershaft above

Polishing and Buffing Machine.

or below, the belt to the countershaft below passing through a large opening in the center of the head and leading outside the head to the pulley. There are two styles of bases or mountings provided—a plain one when an overhead countershaft is to be used, and one with the countershaft attached when it is desirable to belt directly to the main shaft. A feature of the latter is the position of the belt leading to the main shaft, away from any irregular pieces being operated upon. The openings for the belt driving the spindle are through the head, as above stated, and through the rear wall of the base, leading outside over all. The boxes are thoroughly protected from dirt, are detachable and convenient for re-babbiting and are self aligning. The machines are furnished with spindles either for two or four wheels and with single, tight and loose or two-step pulley.

Work has been begun on the new East River Bridge which is to connect New York City with Long Island City by way of Blackwell's Island. The foundations on the eastern shore of Blackwell's Island are now in course of construction, and the coffer dams on the shores of the island and of Long Island City are all ready for work. J. Kennard Thompson is superintending the work of construction, with Charles M. Jacobs in charge of the engineering work.

The Old Soho Foundry.

The Soho Foundry, which was built by Matthew Boulton as a relief to the old Soho Works, so well known in every quarter of the world as the "Toyshop of Europe," is, after all, to go the

workpeople in princely style. Entering the foundry the old man addressed the people assembled there in these terms: "I could not deny myself the satisfaction of wishing you a happy and joyous day, and expressing my regard for all good, honest and faithful workmen, whom I have always considered as classed with my best friends. I come now, as the father of Soho, to consecrate this place as one of its branches; I come also to give it a name and my benediction. I will therefore proceed to purify the walls of it by the sprinkling of wine, and in the name of Vulcan and all the Gods and Goddesses of Fire and Water I pronounce the name of it Soho Foundry. May that name endure for ever and ever, and let all the people say Amen, Amen. This temple now having a name, I will propose that every man shall fill his pitcher and drink success to Soho Foundry."

After this remarkable utterance came the benediction: "May this establishment be ever prosperous, may no misfortune ever happen to it, may it give birth to many useful arts and inventions, may it prove beneficial to mankind, and yield comfort and happiness to all who may be employed in it. As the smith cannot do without his striker, so neither can the master do without his workman. Let each perform his part well, and do their duty in that state to which it has pleased God to call them, and this they will find to be the true rational ground of equality."

Vise Jaws for Tubing.

The Newark Machine Tool Works of Newark, N. J., are placing on the market a small and effective device for holding tubing or any cylindrical piece which is too delicate or too highly finished to be held in a pipe vise, as here shown. The jaws are made of the best vulcanized fiber, securely fastened to pieces of malleable iron, which have shoulders to catch on the jaws, as shown in the engraving. The two jaws are correspondingly bored, so as to form, when placed together, cylindrical openings of different sizes to receive the pipe to be held. The jaws nearly encircle the tubing, holding it so firmly

Vise Jaws for Tubing.

pleasant memories, are to be rased to the ground.

It is not often that we hear of "rearing feasts" nowadays; but in 1776, when the Soho Foundry was formally "dedicated," Boulton entertained his

that it cannot slip and with no danger of distorting the tube or marring the finish of the surface. The grooves in the jaws are made to order in any required diameter up to and including 1½ inches.

THE RETAIL STORE.

Equivalent Balance.

John Chatillon & Sons, 85-93 Cliff street, New York, have brought out the Favorite Equivalent Balance, as herein shown. This scale is designed to prove of great utility to manufacturers and dealers in ascertaining quickly and accurately the weight of 100 or 1 gross of a given article by simply weighing a single piece. This method guarantees against mathematical inaccuracies liable to occur, and takes cognizance of in-

to the dealer who remembers the average Lamp stock of a few years ago. Imported vases in delicate materials, elaborately cut Venetian and other glass, pottery from various quarters of the globe and various fine materials are continually being utilized for mountings by the Lamp manufacturer. While great advances have been made on the fine grades of Lamp, the average stock goods of spun brass or cast metal in a multitude of attractive finishes have been elaborated and beautified, and

shades of other delicate materials, these goods are suitable for retailing at from \$15 to \$75.

Among the tints in which shades are shown are Nile green, corn, pink, canary, light blue, sunrise, sunset, red, orange, red with black lace, and rose pink, at prices ranging from \$2 to \$25 each.

Other new patterns noted are of Venetian and medieval wrought iron, together with large assortments of regular goods.

They have brought out an addition to their line of Student Lamps, supplied with Juno or Miller burners. The Study Lamp referred to is double, with a reservoir capable of supplying both burners eight hours. The standard is 22 inches high and extreme width over all 18 inches. With the exception of the chimneys and shades the parts are all brass, highly polished and nicked. The arms can be varied to suit purchasers so as to take shades from 6 to 10 inches in diameter. This Lamp is especially recommended for double desks or where two are to be accommodated.

Triumph Self Wringing Mop.

Phoenix Mfg. Company, Cleveland, Ohio, are offering a self wringing mop, as here shown. The wire frame over which the mop is doubled is attached to a sliding ferrule. When wringing, the ferrule is pushed down on the handle and twisted, as illustrated in the cut. By sliding the ferrule up on the handle, where it is held by a spring, the lower end of the mop is

Favorite Equivalent Balance.

significant fractions of little concern in a unit, which in multiples of 100 or 144 would be important. Weights of dozens can be quickly approximated by dividing the gross total by 12. The inner row of figures on the dial gives the weight of one piece up to 32 ounces by $\frac{1}{4}$ ounce, the pointer simultaneously indicating the weight in pounds per 100 on the next circle and by the gross on the outer row. Adjustment is made by a thumb screw at the top.

The Lamp Trade.

Manufacturers of lamps are getting their new patterns ready for exhibition, and before the close of May lamps intended largely for the fall trade will be displayed in the various sample rooms for the inspection of critical buyers.

This season of the year in the Lamp industry, while passive with regard to the marketing of this important product, is practically the culmination of the designers' efforts in striving for substantial results in the way of advances on former creations. The immense displays of all kinds, styles and finishes in this important industry are a revelation

placed before consumers by the trade at a much reduced cost as compared with former prices.

Edward Miller & Co.

Edward Miller & Co., 10-12 College Place, New York, have completed the radical alterations and changes made necessary by the widening of College Place. Their front on the new street has been rebuilt, giving them five excellent display windows with single plates of glass. The interior has been thoroughly renovated and electrically lighted. Entire new lines of samples of Hand, Parlor, Banquet, Boudoir, Piano, Hall, Library, Student and other Lamps are elaborately displayed for inspection.

In their large Centennial show case, which is practically a separate room, they have assembled a number of fine examples of rich goods in Drawing Room and Banquet Lamps. The metal bases and heads are gold plated and mounted on vases of Royal Teplitz, Royal Worcester, Crown Derby and Baccarat Ware, richly decorated. There are also some unique specimens in onyx, and gold and silver finishes. Complete with chiffon and feather shades and

Triumph Self Wringing Mop.

brought near the mop head ready for mopping the floor. The design of the device is to avoid the necessity of putting the hands in scalding water to wring the mop, and to allow the use of scalding water, as being more effective in cleaning than water in which the hands could be safely immersed when wringing the mop. The Phoenix mop cloths are referred to as elastic, pliable, light and strong, as absorbing water like a sponge, and as also being adapted to use with any ordinary mop stick.

The Sterling Coal and Gas Range.

The increasing popularity of gas as a fuel for cooking in the summer season has led to the production of the Sterling coal and gas range by the Sill Stove Works, Rochester, N. Y. A sketch of this range, with parts broken away to show its special features, is presented herewith. The range has all of the qualities of a first class coal range. The fire box has a Dockash grate, so arranged that the entire grate can be drawn out through the front of the range in case repairs are needed. It also

is stated that when this range is used with coal and gas the cook has at command nine griddles, two large ovens and a large broiler. With this range the extra expense of a summer stove is unnecessary. It is stated that the gas cooking attachments can be connected with the range at any time, and it is not necessary, when undesirable, to purchase the complete combination.

Cream City Mug.

The Gender & Paeschke Mfg. Company, the well known manufacturers of tinware, at Milwaukee, Wis., are com-

This Sweeper is adapted for use in churches, lodge rooms, hotels and other places where large sized sweepers are required; and the offer of the fans is to aid the dealer in selling the Sweeper and at the same time give him a permanent advertisement.

Wire Broom Fly Killer and Display Stand.

M. D. Jones & Co., 368 Washington street, Boston, Mass., are introducing

The Sterling Coal and Gas Range.

has an end hearth with a patent lift cover and a large ash pan. The oven is large and provided with a transparent and ventilating double door. For coal it is provided with a reservoir when desired. The flues are arranged in a way that is said to insure successful baking under any conditions; and it is this coal range which has been made as a combination gas apparatus. At one side of the high hot closet a gas burner is arranged in the top for broiling, and at the other side a burner is placed both above and below to insure an even heat at the bottom and top of the oven for baking. All odors and steam that rise from cooking with the broiler and oven are carried directly to the chimney through flues. At the end of the range, usually occupied by a warming table or reservoir, three cooking burners are arranged in the form of a bracket attachment, which can be readily adjusted. A water heater is placed behind the range and connected with the water front in such a manner that they may be used alone or both together. When only the gas heater is used, it is recommended that a pipe shall be led from the side connection in the boiler to the hot water service connection at the top, to insure hot water being furnished in a short time after the burner has been lit. The burners used in the different appliances have been carefully graduated and constructed to secure superior results with the minimum consumption of fuel. It

is stated that when this range is used with coal and gas the cook has at command nine griddles, two large ovens and a large broiler. With this range the extra expense of a summer stove is unnecessary. It is stated that the gas cooking attachments can be connected with the range at any time, and it is not necessary, when undesirable, to purchase the complete combination.

Cream City Mug.

City mug, a cut of which is shown herewith. The article is described as well made and low priced and it is expected will have a large run during the picnic season.

BISSELL CARPET SWEEPER COMPANY, Grand Rapids, Mich., are offering to send free with each Bissell Grand Sweeper 50 Japanese Flat Fans with the dealer's advertisement on the back.

Fig. 1.—Wire Broom Fly Killer.

the Wire Broom Fly Killer which is shown herewith by an illustration one-third size. The article is a broom made of very light wire attached to a short handle by means of a metal ferrule securely pinned to the stick. The bristles are held in shape by a cord braided

Fig. 2.—Fly Killer Display Stand.

through, as shown in Fig. 1. The manufacturers claim that the broom kills but does not crush the fly or other insect. It cuts the air and gives the fly no warning of its approach, as is the case

with a newspaper. For hardware dealers the killers are put up one dozen in a box, and a display stand, as in Fig. 2, is sent free with the first order.

Nestable Strainer Pails.

The Nestable strainer pails herewith illustrated are offered by Sidney Shepard & Co., Buffalo, N. Y. The pail has

Fig. 1.—Nestable Strainer Pail.

a broad lip and strainer attachment, while the attachment is adapted to use muslin in addition to the strainer, if desired. It is explained that should customers object to the detachable strainer, it is arranged so that it can be readily soldered fast by a tinner in a short time. The nestable feature enables the dealer

Fig. 2.—Strainer Pails Nested.

to store a dozen pails in the space usually occupied by two pails. The manufacturers remark that they have not sacrificed the essential qualities which dairymen require, and that without taking into account the nestable features, they consider the pail unequaled.

ANNOUNCEMENT IS MADE that the American Wringer Company, 99 Chambers street, New York, have sold the patents and good will of their business in Cork Pullers, Milk Shakes, Lemon Squeezers and Ice Shaves to the Erie Specialty Company of Erie, Pa., who will hereafter manufacture this well-known line, including the Samson Cork Puller, Imperial Milk Shake, Imperial Ice Shave and Acme and Fifth Avenue

Lemon Squeezers. The Erie Specialty Company state that they will maintain the high standard of excellence which these goods have attained, and intimate that with their facilities for manufacturing they are in a position to give orders prompt and careful attention.

Polar Ice Pick.

The Dana Hardware Company, Boston, Mass., as selling agents for Estes & Co., Nashua, N. H., are introducing the Polar ice pick shown in the accompanying illustration. The action of this pick is similar to that of a nail puller. The head, which is heavy cast iron, slides down the steel awl $2\frac{1}{4}$ inches, thus mak-

Polar Ice Pick.

ing very little arm force necessary to be put into the blow. The pick is finished in nickel and japan.

MEMORANDA.

READING HARDWARE COMPANY, Reading, Pa., advise us that they are in receipt of many orders for Apple Parers, which they refer to as significant of a conviction on the part of the trade that the apple crop throughout the country this year will be a large one. In consequence of the increased demand for their goods and to avoid getting behind their orders the company have issued a circular to their customers in which they request an anticipation of their wants in this line, thus insuring prompt shipment and receipt of the goods.

THE LEACH ROASTER & BAKER COMPANY, Paxton, Ill., have changed their name to the Paxton Hardware Mfg. Company. They have also increased their capital stock from \$8000 to \$30,000.

THE R. H. GALE MFG. COMPANY, Duluth, Minn., have been incorporated, with a capital of \$50,000, with the following officers: B. Silberstein, president; Edward A. Silberstein, secretary and manager; O. C. Hartman, treasurer and R. H. Gale, superintendent. The company will manufacture the Nickeline

stove polish, the making of which was first commenced last October, with much enlarged facilities.

THEODORE PHILIPP, dealer in stoves, hardware and tinware, crockery, lamps and glassware, has sold out his business in Silver City, Idaho, and is at present building a store at Jerome, Arizona, where he will continue the same business. He is desirous of obtaining catalogues, prices and discounts of goods in the lines which he intends to handle.

THE COMSTOCK-CASTLE STOVE COMPANY of Quincy, Ill., have recently purchased the hardware and stove business of Seymour Castle, and will, about June 1, open a large store at 530 Main street, in the city named. The new store will be restocked with a large assortment of goods adapted to the requirements of the stove and hardware trades, and the establishment will be in charge of J. M. Welsh of the Welsh & Parish Hardware Company of St. Joseph, Mo.

THE CONDENSED CATALOGUE of factory and railroad milk cans is just received from the Buhl Stamping Company, Detroit, Mich. It is a handy little volume of 40 odd pages and gives all essential information concerning their extensive line of milk cans, stock and dairy supplies. Various forms of cans are illustrated and prices given, as well as lists of sizes. In all some 18 different styles of finish of cans are shown, while trimmings and parts are similarly illustrated and described.

JOHN W. SMITH & SON, 264 West Twenty-eighth street, New York, make a specialty of chimney sweeping in large buildings and fine residences. They have recently cleaned the chimneys of the Hotel Netherlands, Hotel Savoy and the Holland House, New York City, and are now busy in cleaning chimneys of some of the palatial residences in and near New York.

George Pinkham, Topeka, Kan., is manufacturing a pump which is designed to meet the requirements of those who are obliged to pump water for irrigating purposes. The water is lifted by rotating steel blades, and it is stated that a single horse working in a treadmill can raise an incredibly large quantity of water.

Building operations in Philadelphia during the month of April were the largest in volume reported for the last two years. The estimated value of permits and operations during the month was \$4,202,842, which was nearly twice the total for April, 1894, and one-third larger than for the same month in 1893. The most satisfactory feature of this exhibit is the fact that no great buildings have contributed to swell the total, new construction being almost entirely in the field of small dwellings, such as those which are inhabited by the wage earning class.

According to estimates just completed by the New York Board of Health, the population of the city now exceeds 2,000,000. The municipal census recently taken will shortly give the exact figures, which are not yet known.

The first bicycle ever brought to this country was, it is claimed, owned and ridden by Robert Center of New York, who was killed last recently while riding his wheel in Central Park.

The Merrell Nipple and Pipe Mill Machine.

The machine which we illustrate was designed and built with special refer-

chasing cutting any style or pitch of thread. In operating it is but necessary to insert the pipe, start up the machine, move the dog to close the vise, move the head to the pipe, and the machine does the work. This machine is made

The Merrell Nipple and Pipe Mill Machine.

ence to rapidity in the cutting and threading of pipe. The gearing is entirely protected from dust, being inside of the cone, and six different speeds are obtained with but a three-step cone. The pump is out of the way of the operator and can be changed so as to flood either the dies or the knife or shut off entirely while the machine is in motion. The head is adjustable, quick opening and closing dies, and is so swiveled that it can be reversed and the pipe cut off close to the grippers. The vise is opened and closed while the machine is in motion by the movement of a dog either forward or backward. The sleeve operating the vise is adjustable, and can be adapted to the wear consequent upon long usage, and also to the variation in the size of pipe. By the use of the nipple grips pipe of all sizes within the range of the machine can be threaded. The nipple grips can be closed on the threaded ends of the pipe without injury to the thread, thus avoiding the necessity of screwing the nipple into the grips after they are closed. This is stated to be a feature peculiar to this machine.

The machine will make left hand threads as well as right. With this machine is furnished a threading gauge which works automatically and releases the chasers when the desired length of thread has been cut. With this arrangement any number of nipples can be turned out duplicates of each other as to length and length of thread. The chasers are five in number and are set by graduation to any size desired. They are released from threading while the machine is in motion, opened to permit the pipe to pass through to the cutting off knife and closed instantly and positively. They can be sharpened by grinding and are readily replaced by

by the Merrell Mfg. Company of Toledo, Ohio, in two sizes, the first

Improved Hot Air Furnace.

A hot air furnace which embodies a number of interesting features of construction is just being introduced to the trade by S. J. Benedict of East Randolph, N. Y. Special attention is invited to the manner in which the products of combustion are taken from the fire pot and carried through long narrow slots into projecting pipes connecting with a low down radiator or smoke conveyer which extends entirely around the fire pot and which at the rear side communicates with the smoke pipe thimble and check damper. The arrangement of parts is such that all accumulations of dust or ashes can be readily removed by means of clean out holes and covers. Arranged about the fire pot is a series of vertical air flues consisting of the best quality lap welded tubes set in sockets at each end and thoroughly cemented. They are held rigid in proper position by means of rods or bolts which extend from top to bottom. In the accompanying illustration we show a view of this hot air furnace, with a portion of the side removed, so as to clearly indicate the internal arrangement. This furnace, we understand, has been thoroughly tested, the results showing it to be powerful and economical.

Dispatches from St. Petersburg assert that the Standard Oil Company and the Russian oil producers have definitely perfected an agreement whereby they will divide the markets of the world. The agreement, it is said, now only awaits the Russian Finance Minister's sanction before becoming operative.

Four new ironclads, of from 3400 to 4600 tons, are being built for the Dutch Navy. They are after the design of the

Improved Hot Air Furnace.

cutting from $\frac{1}{4}$ to 2 inch pipe inclusive, and the second from 1 to 4 inch pipe inclusive.

"Latona" and "Astrea" of the British Navy, carrying a crew of about 300 men.

PLUMBING and GAS FITTING.

Amendments to the Constitution.

Over the signatures of John Mitchell, president, and H. J. Pattison, secretary of the National Association of Master Plumbers the following amendments are being sent to the plumbers for consideration.

In accordance with the provisions of Article 15 of the constitution and Article 16 of the by-laws, prescribing that all amendments to the constitution and by-laws shall be in writing and in the hands of the secretary 30 days before the annual meeting, I have received the following, which I submit for the careful consideration of your association so that the delegates to the convention will know the wishes of their constituents:

Proposed amendments to Articles 2 and 3 of the by-laws, recommended by the National Executive Committee:

"The Executive Committee recommends to the thirteenth annual convention that Article 2 of the by-laws be amended as follows: 'The bond of the financial and recording secretary be increased to a sum not less than \$2000, as in the discretion of the Executive Committee may seem best, and that the surety be in a responsible guarantee company, and the fee for the same be paid out of the national treasury.'

"The Executive Committee recommends to the thirteenth annual convention that Article 3 of the by-laws be amended as follows: 'The bond of the treasurer be increased to a sum not less than \$5000, as in the discretion of the Executive Committee may seem best, and that the surety be in a responsible guarantee company, and the fee for the same be paid out of the national treasury.'

Proposed amendment to the constitution, providing for membership from the British Provinces, recommended by the Master Plumbers' Association of Boston and Vicinity:

"Resolved, That we urgently recommend to the favorable consideration of the members of the National Association of Master Plumbers that the scope of the organization be enlarged so that the master plumbers doing business in the British Provinces be admitted to membership."

Proposed amendment to Article 4 of the constitution, recommended by the New York State Association of Master Plumbers, through its president, Wm. J. McDermott:

"All local associations and individual members must be affiliated with their respective State associations, where same exist, in order to be recognized by the National Association."

Proposed amendment to the constitution to provide for a National Organizer, recommended by the Providence Master Plumbers' Association, through its president, Patrick Tierney:

"Resolved, That the constitution and by-laws of the National Association of Master Plumbers be and the same is hereby amended by the adoption and creation of an office to be known as the

National Organizer. Said office to be filled by a man appointed each year by the National Executive Committee at its first meeting, and to receive a salary not to exceed \$1500 per annum. It shall be the duty of the National Organizer to devote his whole time and attention to the advancement and organization of our trade through local and State associations in affiliation with the National Association. To adjust all differences of whatever nature referred to him by the executive head, acting at all times under and subject to the National Executive Committee. He shall make an annual report of his doings throughout the year to the next convention following his appointment. This resolution shall become a law and go into effect after its passage.

"Resolved, That the salary and travel expenses of the National Organizer, after being submitted to the Executive Committee and audited by the Auditing Committee, shall be paid from the general treasury, and that it shall be optional with the Executive Committee what charges shall be made to State and local associations (if any) for service rendered to them, by the National Organizer."

It may not be amiss to call attention to the fact that the last annual convention referred to a special committee on revision of constitution and by-laws the following, which will, no doubt, be reported to the convention:

"All local associations and individual members, in order to be recognized by the National Association, must be affiliated with their respective State associations, where such exist, by paying the per capita tax imposed by the State associations." This proposed amendment was referred to the committee on revision of constitution with instructions to revise Articles 4 and 5, affecting representation.

Amend Article 3 of the constitution by adding to it a paragraph to read as follows: 'The official year shall begin on the first day of June and end on the thirty first day of May. The president, financial and recording secretary and treasurer shall present reports at the opening of each annual convention of the association, showing their official transactions and the state of the association. The reports of the financial and recording secretary and treasurer shall be made up to and dated the day of the ending of the preceding association year.'

"That the special committee to be appointed on amendments to the constitution present amendments to provide for the appointment of a credential committee to sit at a time before the opening of the annual convention with a view of securing a report of the committee promptly upon the opening of the convention."

No amendments to the constitution providing for the appointment of a credential committee to sit before the convention meets, or a change in the fiscal year, would be necessary if local associations and individual members would pay their *par capita* tax when due, or before the convention meets; also, send in the credentials of their delegates. A

compliance with the above would enable the secretary to make out his report and be in a position to certify credentials and save the committee waiting for credentials to be passed upon by the secretary, which is impossible when members put off until the very last moment what could just as well be done two weeks before.

The Foreman Plumber.

BY SAMUEL A. HEINS, RONDOUT, N. Y.

I would like to say a few words through *The Metal Worker* on management of plumbing work and workmen. There is a great deal in managing workmen. In the first place the foreman should be a first-class mechanic and high up in sanitation. Some foremen are naturally fitted for this position. They have a genius for it; it comes to them by nature. With others it is difficult, their natural temperaments are against them; they are perhaps too self-conscious, a defect leading them, on the slightest occasion, to take offense; or they are liable to abstraction, which is another defect, preventing them from having their eyes open and taking a wide view. He must not be an absent-minded man. A foreman may possess more intellect, be a deeper thinker and have greater experience than his more successful brother, but lack the knack or tact of the other. While with some to manage men is a natural instinct, with others it is an art to be learned. Happily the art can be acquired, and in a less or greater degree all foremen should study to acquire it. Indeed, it is indispensable to success in the position he holds. The ability to manage men and the exercise of it smooths the thorny path of management. The wheels of the machinery run with less noise and friction; there are fewer back lashes to endanger the cogs and throw the pinions of life out of gear.

A judicious mixture of firmness, fairness and urbanity is needful for success in managing men. To be fair while you are firm secures confidence in your judgment and in your character for straightforwardness. One can be firm without bluster; urbanity is not a sign of weakness, and it sugars the pill of command. Our greatest generals have been men of quiet demeanor, not given to superciliousness. The order to do a thing should be given with a due sense and knowledge or belief that the person ordered is likely to perform the duty imposed upon him. An unreasonable order secures its own defeat, and it is more creditable to the person in command than to the servant.

A bond of sympathy should unite the manager and his workmen and it is the foreman who must weave it. Sympathy may well flow downward like water, but it also rises as water does when the tide is coming in. When the waters meet there is peace and a great stillness and a full sense of satisfaction. Where there is indifference the sympathetic waters recede and there is a barren strand littered with a noxious growth that poisons the air.

Local Associations.

PHILADELPHIA.

At a meeting of the Master Plumbers' Association of Philadelphia, Pa., held at the Builders' Exchange, the following persons were elected delegates and alternates to represent the association at the Thirteenth Annual Convention of the National Association of Master Plumbers, to be held on June 11, 12 and 13: Delegates, William McCosh, George F. Ueber, William H. Doyle, William S. Clark, William Harkness, Samuel W. Barnes, F. P. Brown, A. W. Hicks, John Gormley, J. S. Penock, John E. Eyanson; alternates, Robert Drummond, J. W. Smith, William Mentzinger, Walter Jones, A. G. Bond, Samuel Fleming, W. L. Owens.

BRIDGEPORT, CONN.

At a meeting of the Master Plumbers' Association of Bridgeport, Conn., held last week, the following delegates were elected to attend the National Convention of Plumbers in Philadelphia in June: H. B. Middlebrook, Thomas E. Logan, L. H. Mills, George E. Scofield; alternates, C. S. Eames, Theodore Fox.

PITTSBURGH

The Master Plumbers' Association, Pittsburgh, Pa., met last week in their rooms at the Builders' Exchange. Delegates to National Convention of Master Plumbers were elected as follows: C. H. Humbert, J. L. McShane, Joseph A. Weldon, J. J. Kennedy, T. B. Blythe, James Hay and R. J. Bradshaw; alternates, Frank McKnight, J. O. McGinness, Joseph Rice, S. W. Hare and George Addy. The matter of supervision of plumbing in Pittsburgh and Allegheny was taken up and a Committee on Legislation was created. It consists of James Hay, Joseph A. Weldon and J. L. McShane. This committee was instructed to draw up an ordinance for licensing all persons doing business as master plumbers, and the inspection of all work, old as well as new.

ALBANY.

The Master Plumbers' Association, Albany, N. Y., held a regular meeting last week in their new quarters, room 11, DeGraaf Building. In addition to the transaction of routine business the following members were chosen to represent the association at the thirteenth annual convention of the National Association of Master Plumbers, which meets at Philadelphia, June 11, 12 and 13: Delegates, Horace F. Westcott, Joseph A. Stahl, John E. Dugan, J. Edward Jones, Fred W. Ridgway; alternates, Timothy E. Kerwin, John J. Britt, Frank F. Schimpf, John H. Russell, Allen Gilmour.

CHICAGO.

The following delegates and members of the Chicago Master Plumbers' Association are to attend the convention of the National Association to be held at Philadelphia, June 11, 12 and 13: T. P. Culloton, J. H. Roche, J. B. Breen, J. J. Wade, J. DeVeney, M. J. Corboy, P. Sanders, C. C. Breyer, D. J. Rock, C. J. Herbert, J. G. Roland, M. L. Mandable, A. W. Murray, A. C. Hickey, C. J. Boyd, T. Conway, G. A. Larson, W. T. Geary, C. Byrnes, P. M. Murphy, Paul Redieske, Robert Griffith, Andrew Young. Alternates are T. C. Boyd, J. G. Webber, J. A. Voltz, D. M. Quay, J. L. Emblem, J. Degnan, R. B. Finn, J. J. Rourke, E. Baggot, J. Sanders, W. H. Cummins, D. Whiteford, J. J. Clark, J. H. Killian, R. Reich, J. J. Doyle.

NEW YORK CITY.

H. J. Pattison, vice president of the Master Plumbers' Association of New York City, gives us the following list of delegates who were elected last week to attend the National Convention of Plumbers to be held in Philadelphia in June: Gen. Geo. D. Scott, John Buras, John Mitchell, Henry J. Pattison, Henry G. Gabay, Frank Reynolds, J. S. Lindsay, Jos. W. O'Brien, Timothy Sullivan, Thomas J. Tuomey, E. J. Brady, James Muir, Cudwell Fraser, Thos. J. Cummins, Adam Huston, Wm. J. McDermott, M. J. McDermott, John Renehan, Michael Ryan, Charles Schloesser, John Regan, T. J. McCormack, William Young, Charles A. Walsh, James Fay, Isaac J. Brown, Jas. G. Collins, Wm. Kirchhof, Saml. Malcolm, John Yule, Thos. R. Delacey, Saml. Clark, A. H. Brown, John McCarron, Alexander Cameron, Thomas Martin, Wm. Montgomery and Alexander Bryant.

NEWARK N. J.

At the meeting last week the Master Plumbers' Association of Newark, N. J., elected the following delegates to the Philadelphia convention: Elias Berla, N. J. Steiner, C. Sullivan, Alex. Don, F. J. Sturn, Wm. Jacob, Wm. Zelfif, E. A. Bleything and Ira Budd.

TRAPS AND VENTS.

A NEW PLUMBING ESTABLISHMENT is to be opened in Stamford, Conn., by Jessup & Dunn.

THE FIRM of Smith & Son, plumbers, are erecting a three-story apartment building on the south side of Mahanogony street, Pottsville, Pa.

WM. STONEBACK and CHAS LEWIS have gone into the plumbing business at 31 North Seventh street, Allentown, Pa.

LUCKETT & FINDLAY, 98 Schermerhorn street, Brooklyn, make a fine line of gas, electric and combination fixtures. They also make a specialty of gold, silver and nickel plating.

AN ATTRACTION on the walls of the plumbing showroom of F. A. Hutchinson, 334 Myrtle avenue, Brooklyn, is a miniature piece of kitchen plumbing. Mounted on a panel 2 feet square is a copper boiler 1½ inches in diameter and 6 inches high. This is connected with a water back with ½-inch lead pipe. The service pipe branches immediately upon coming above what is supposed to be the floor. The main line runs up to an air chamber, a branch being taken from the side of this pipe below the air chamber to the boiler. The branch of the service pipe runs to the far side of the panel, and a branch is carried up to a small brass faucet over the sink, an air chamber being placed above the faucet. The supply pipe continues on and rises to supply the second floor, a stop cock being placed near the ceiling. From the top of the boiler the hot service runs to one side and takes a downward turn, with an air chamber above the turn. Near the floor a branch is taken to supply the fixtures on an upper floor, with a stop cock near the ceiling. The hot service continues by this branch to the brass faucet over the sink, with an air chamber above it. The pipe from the water back, after branching up and connecting with the bottom of the boiler, continues across the board and presumably connects with a sink waste. A stop cock, however, is placed in this pipe, and between the stop cock and the

boiler a pipe branches into it, which is the return circulation pipe from the fixtures on the upper floor. As a piece of plumber's handicraft this is a very creditable exhibit. The pipes all have neat bends, the joints being of good color and very perfectly shaped considering their small size.

THE W. C. VOSBURGH MFG. COMPANY, 269-281 State street, Brooklyn, have a large building devoted to the display of their line of gas, electric and combination fixtures. Different floors show different styles of goods, some being finished in Roman gold, old brass, silver plate and a steel finish. One room is devoted to a display of wrought iron chandeliers and library pendants. The company are about to bring out some new designs. One that is especially attractive is finished in Roman gold for electricity, the globe being a ball shaped opal instead of being transparent. One of their electric fixtures is a portable stand, which has flexible arms, so that the light attached may be shifted to several different positions within a given radius.

RONALDS & Co., at their Brooklyn factory corner of State street and Boerum place, have a large plant where they manufacture a varied line of copper and galvanized iron boilers. They also have their pipe presses, and here manufacture all sizes of lead, tin lined lead and block tin pipe. One portion of their buildings is devoted to the manufacture of bathtubs and another to the manufacture of lead traps. For the convenience of Brooklyn and Long Island plumbers a large space on one of the floors has been arranged as a show room for displaying their varied line of sanitary plumbing fixtures. Here are shown various styles of enameled cast iron bathtubs, with wood rim and with roll rim, also a variety of siphon jet and wash out water closets and lavatories.

HARRY SMITH, from Lewiston, Ill., has associated himself in the plumbing business with his brother Frank, at Oconto, Wis., the firm to be known as Smith Bros.

WARD S. GREGORY and RICHINGS J. SHAND have purchased the plumbing business of I. W. Springer & Co., on Water street, Rockford, Ill.

THE MASTER PLUMBERS of St. John, N. B., for some time have been discussing the advisability of organizing for the promotion of the general interests of the trade. With this in view several meetings were held and correspondence had with many plumbers. A general response was received and the association starts with a membership of 40 or more master plumbers. At the last meeting held considerable progress was made in forming a constitution, &c. The association is to be designated the "Master Plumbers' Association of the Maritime Provinces." Montreal has now a very large association, embracing Quebec and other cities, while Toronto is also in the field, making their presence felt by free lectures on sanitation, a spread of the knowledge of all matters appertaining to hygiene and plumbing, &c., while the matter of price-lists and indiscriminate sale of materials by dealers to inexperienced workmen and others is brought under consideration.

GILBERT B. Dow died at his home on Pearl street, Burlington, Vt., last week. He was born in Danville in 1825 and came to Burlington in 1844, engaging in the tinmith and plumbing business with Isaac Dow.

PRESIDENT McDONALD and SECRETARY NOBLE of the Master Plumbers' Association, Brooklyn, headed about 40 plumbers one morning last week who desired to protest against several sections of the new rules on plumbing and drainage just issued by the Board of Health. Commissioner Emery and Sanitary Engineer Johnson received the master plumbers. The principal objection of the master plumbers is to rule No. 40, which requires that they shall draw a map, showing where pipes of all kinds are to be located in new buildings. In the opinion of the president it will cost from 25 to 40 per cent. more and is almost an impossibility before the plumbing is put in. The Commissioner promised to consider their grievance.

THE ORGANIZATION of Montreal's plumbers has been followed by the establishment of plumbing classes at the Government trade schools, which are taught by a specially delegated master plumber and journeyman plumber.

CATHARINE McCUAIG has been registered proprietress of the plumbing business of Egan & Co., Montreal, Canada.

G. J. MORTON, plumber, Yarmouth, N. S., has admitted Harry A. Killam as a partner. The firm style now is G. J. Morton & Co.

BAILEY & STOWART of Middletown, Conn., plumbers, have dissolved partnership. J. W. Bailey will continue the business.

THE IMPORTANCE of Cincinnati, Ohio, as a center for the manufacture of plumbers' standard goods and specialties, is dilated upon at some length by a local paper.

THE BOARD OF EXAMINING AND SUPERVISING PLUMBERS, Binghamton, N. Y., held a meeting last week and C. H. Warner and John Lynch, Jr., were examined for master plumbers' certificates.

AN ENTERPRISE of which they are justly proud is reported by Thomas Kelly & Brothers, Chicago. They have recently made export shipments of some of their plumbing specialties to Berlin, Germany, and to Melbourne and Sydney, Australia. This speaks well for the sanitary furnishings manufactured in the United States. There is no good reason why a considerable trade should not be developed outside of the United States for plumbing goods. Some of the American houses already do a considerable trade in Cuba and in Mexico. Some drawbacks have been met in the attempt to introduce modern plumbing in Mexico owing to a want of a proper system of sewage. The City of Mexico, lying in a basin, has for years been troubled with the disposal of its sewage; but recently a large tunnel has been completed to carry the sewage through the hills intervening between the city and the water courses to a lower level. This should open up a field for an enterprising manufacturer of plumbing supplies and fixtures, as the city already has an abundant supply of excellent water.

THE FOLLOWING PLUMBING FIRMS have recently started business in Chicago: McIlvaine & Jordan, 704 1/2 Forty-third street; James C. Clinton, 1181 West Madison street; M. A. Berg, 364 West Taylor street; McGinty & Harper, 1050 Tripp street; John C. McCarthy, 4720 Wentworth avenue; George W. Palmer, 511 Wabash avenue; F. B. McCuren & Co., 3730 Cottage Grove avenue.

W. C. HAINES & BRO., are a new plumbing firm at 149 South Sixth street, Allentown, Pa., the members being W. C. and J. F. Haines.

A BROOKLYN PLUMBER has already been fined for violating the new regulations which went into effect May 15. He was doing work without having filed plans with the Health Department as required.

THE GUHEEN STRAUSS PLUMBING COMPANY of St. Louis have been incorporated, with a capital stock of \$5000. The incorporators are John Guheen, Gustave Strauss and W. D. Quigley.

THE CONTRACT has been closed between the East Moline Mfg. Company, Moline, Ill., and Lee J. Mittinger of Cleveland, Ohio, who represents a manufactory of brass goods, plumbers' supplies and stamped ware, of that city, for the transfer of their industry to Moline's new city of mills. It will employ over 100 men.

ROBT. CLARK, 100 Schermerhorn street, Brooklyn, is issuing to the trade a 16 page catalogue devoted to his lead, brass and nickel plated traps and plumbers' specialties. The first six pages are devoted to lead traps, showing bottle traps, bag traps, grease traps, running traps, round traps, Boston traps and the ordinary traps. These are shown with trap screws and with and without vent. The next six pages show nickel plated brass traps with waste pipe for lavatories, urinals and baths, the waste and vent pipes being either exposed or hidden. Another page shows a great variety of nickel plated and polished brass legs for open lavatories. A specialty is made of supplying flush pipes, tank and supply pipes and basin and bath pipes to order, and jobbing brass work and nickel plating. Another specialty of his business is lead burning, work being done at his shop, or expert lead burners will be sent where the work is to be done.

AT THE NEW YORK OFFICE. 92 Walker street, of R. M. Wilson, Rome, N. Y., a steady increase in demand is reported for their all copper sanitary bathtub. Some inquiries have been received for it from foreign countries, some sales having been effected in Italy and Japan.

G. F. HICKMOTT, representing the Birkery Mfg. Company, Hartford, Conn., is a visitor among the plumbing trade of New York City this week, and reports a general increase in trade. He has placed a number of good orders for the Birkery high pressure ball cock.

AT A MEETING of the Master Plumbers' Association of Hudson County, this week, a number of guests were entertained. The association is now thoroughly organized and has affiliated with the National Association of Master Plumbers. National President John Mitchell addressed the assembly, and among the other speakers were F. A. Smith, New London, Conn.; C. Sullivan, Alexander Don, Ira Budd and F. G. Sturn of Newark, N. J.

The climatic vicissitudes of Kansas were amply illustrated last week. In the middle of the week the inhabitants in the southwestern part of the State were sweltering under a temperature of 104°, while at the close they were experiencing heavy snow storms and keen northerly winds with a temperature close to the freezing point.

The Volume of Money.

It is an extraordinary thing, says *The Iron Age*, that there should be a tremendous agitation for a financial revolution resting entirely upon imaginary grounds. Desperate situations may justify desperate remedies, but they do not justify jumping from the frying pan into the fire, and our money situation is far from desperate. The disasters of 1893 and 1894 do not justify an agitation for the substitution of the silver standard in this country, which had been in progress for years before 1893, and is even growing more intense as the country emerges from two years of depression and heavy losses. For many years before 1893 the country was on the whole prosperous. It was not free from financial disturbances, and in some directions heavy losses were incurred, yet for a dozen or fifteen years business of every kind had expanded, wealth was accumulated, railroads kept in advance of population, and factories and mills multiplied on every hand. To revolutionize our financial system, under which till lately the country prospered, and under which it is giving evidence of recovery, and to revolutionize it in a direction condemned by reason and experience, is a course that cannot commend itself to sensible men, and least of all to men in business with large interests at stake.

What, then, is the excuse for the threatened revolution? It is an alleged contraction of the currency that has no existence. Neither the condition of the national treasury nor that of the banks indicates an insufficient volume of money. The volume of money in the country is much larger than it was 15 or 20 years ago. The much talked of circulation per capita has little significance, but the ratio of money to population has increased. The volume of gold money, and even its ratio to the population, has increased. The apprehensions of a gold famine are singularly out of season when the production of gold is greater than ever before and promises to remain for many years at about its present rate, when all commercial nations have increased their stocks of gold money, and when modern methods of banking and clearings and international exchanges have vastly economized the use of specie.

It is not even true that silver has been abandoned as a money, or that the monetary use of silver has been sustained in this country. The trade dollar, though not a legal tender, supplied employment for more than four times as much silver as had been used in making the legal tender dollar for eight years. The old dollar, whose further coinage was stopped in 1873, was revived with its legal tender qualities unimpaired in 1878, and for 15 years was coined in immense quantities, or the bullion was stored and represented in circulation by notes. The coinage of full legal tender silver money since 1873 has been vastly greater than it was previously.

The world at large has been increasing its silver coinage, and all the demonetization of silver that has occurred was the sale by Germany of a part of its silver coins. The amount sold was a little more than two years' purchases by our Government, under the act of 1890, and the sales were practically completed 16 years ago.

The grounds on which the country is asked to change its monetary system are irrelevant or imaginary, and the step itself would be worse than a leap in the dark; it would be a leap into obvious and unmistakable disaster.

ROOFING AND CORNICE.

Metal Tiles.

"Art in Metal Tile Roofing," which is the title of a pamphlet just issued by W. H. Mullins, Salem, Ohio, with eastern sales agency at 108 Chambers street, New York, is an exceptionally handsome publication. It is a pamphlet of the portfolio form—that is, the oblong sheets are held together at the back by a silk cord, and the binding is in parchment paper, the title on the front cover being raised and printed in green bronze. In the introductory note terra cotta roofing tile is alluded to, its merits are pointed out, but it is noted that in a climate of sudden changes this form of roofing has grave defects. The advantages of the sheet metal tiling are then compared and its advantages will be readily appreciated. The application of zinc to roofing purposes is likewise referred to in the introduction of the pamphlet, and readers are directed to the forms of zinc roofing that are illustrated. The entire introduction is compressed into a couple of pages, and following it immediately is the illustrated portion of the pamphlet. The first is a half tone full page engraving of Mr. Jefferson's residence on Buzzard's Bay, which is roofed with W. H. Mullins' patent copper tiles. Other handsome buildings and residences are similarly illustrated. The engravings that succeed are printed in brown ink, showing the detailed construction and the method of application of the various forms of tiles. These include Spanish tile, the Alcazar, the American, Saratoga, Scroll, Newport Shell, Columbian, Buzzard's Bay Shell and Atlantic Shell. Fancy ridging and hip moldings come next, with finials and terminals to match. The last three pages show Kinner's patent sheet metal roofing and stamped zinc roofing and stamped zinc roofing tiles. In addition to architects the roofing and cornice trades will value this publication.

The Berger Mfg. Company.

An attractive catalogue comes to hand from the Berger Mfg. Company, Canton, Ohio. It is a volume of over 100 pages, bound in a yellowish paper, with the name and address of the concern in raised red letters. The contents of the volume cover a most extensive assortment of roofing supplies, a great many new goods being included among the illustrations. This is the ninth annual catalogue and price-list issued by the Berger Mfg. Company, and in itself is a witness to the growth of this well-known concern. The first goods noted are the well known Berger slip joint eave troughs; Berger's combination roof gutter, followed by quarter circle, ogee and box gutters; Berger Imperial steel eave trough hanger, and the method of applying the adjustable hanger is shown. The Perfection wire hanger is another sort illustrated and Berger's patent adjustable irons are alluded to. Berger's corrugated expanding conductor pipe, round and square, occupies two pages; cast iron boots and sewer connections follow; then come 10-foot plain lock seam pipe, spiral lock seam

pipe, adjustable elbows, strainers, conductor fasteners, conductor books, rain water cut offs, speaking tubes, &c. Several pages in the middle of the book are given up to Berger's prepared American roofing plates for double seaming, put up in rolls 100 square feet to the roll. Allusion is made to the patent packages in which the rolls are sent, which insure the material being received in good condition. A number of ventilators are illustrated and the pages that follow are devoted to galvanized iron, ridging, cresting blocks and finials, of which a great variety are shown; galvanized iron crestings, malleable iron crestings and finials, &c. Cornices are illustrated in extensive variety, and then come hip caps and finials of galvanized iron, which occupy a number of pages. The second section of the pamphlet is entitled "Sheet Metal for Roofing, Siding and Ceiling," and gives practical information which will be appreciated by the trade. After the introduction come illustrations of various kinds of roofing, lock seam, standing seam and crimped edge. Corrugated sheets are noted at some length; cluster tiles or shingles, as well as the Cushman metallic shingle, are illustrated and described, and siding and ceiling follow, and then sheet metal ceilings, pressed brick, rock faced stone and other forms of rock faced materials adapted to fronts, cornices, pilasters, window caps, &c. A number of illustrations show the fronts of buildings made of this material. Various miscellaneous articles are alluded to at the close of the book, including iron doors and shutters, and at the very end is an alphabetical index.

FLASHINGS.

DISLEY & WEYAND, Waterbury, Conn., have another big contract for the Benedict & Burnham Mfg. Company for 3000 feet of copper skylights on the rolling mill, and also for a large number of galvanized iron ventilators.

THE PHILADELPHIA STEEL ROOFING COMPANY, Philadelphia, have placed their Boston agency in the hands of G. W. Van Horn & Son, 38 Kilby street, in that city.

D. B. HILTON, whose sheet metal working establishment on Clermont avenue, Brooklyn, was recently destroyed by fire, is now at 250 State street, where he has facilities for turning out cornices and skylights promptly. He contemplates making extensive alterations at his present location and will then have a fine shop with every convenience for his business.

THE COLUMBIA CORRUGATING MFG. COMPANY, Chicago, Ill., and Niles, Ohio, issue their 1895 illustrated catalogue and price-list. The first few pages give shipping directions and other information to buyers, and the catalogue proper opens with roofing tools, the Chicago patent roofing, both cap and folding cap. V-crimped roofing is similarly illustrated and described. Two tables of corrugated iron will be found very useful to the roofer. Rock faced

siding of various kinds is shown by fine engravings. Ridging strips, ridging caps, corrugated iron and roofing tools complete the first part of the pamphlet. Part second comprises conductor pipe, eave trough and galvanized sheet metal goods; also their patent lath and nested stove pipe, &c. Tables of sizes and prices accompany the illustrations. The manufacturers call the attention of users of these goods to the desirability of having them made of galvanized steel sheets. An alphabetical index, following a few pages for memoranda, completes the volume.

THE E. E. SOUTHER IRON COMPANY, St. Louis, Mo., issue their illustrated roofing catalogue for 1895, which is a pamphlet of 40 pages, bound in tinted paper and published in the interest of the roofing and cornice department of the company. An introductory page showing the method of laying corrugated iron is followed by illustrations and descriptive particulars of the various sorts of corrugated iron made by this concern. Curved corrugated iron for awning and other purposes is similarly illustrated. The application of corrugated iron to siding purposes is shown by the aid of cuts, and then various sorts of roofing are illustrated; also standing seam, roll and cap, V-crimped, &c.; sheet steel, pressed brick, beaded siding and ceiling and weather boarding. Then come flashings, combing strips and roll caps. Roofing sundries are noted, including paint and cement, roofing tools and galvanized iron, while the remainder of the catalogue is devoted to gutters, piping, cut offs, box gutters and metallic shingles. The company also issue a catalogue exclusively devoted to their gutter department.

T. W. ERWIN of Allegheny, Pa., has been awarded the contract for galvanized iron and skylights for the new plant of the Westinghouse Machine Company, at Brinton, Pa., on the main line of the Pennsylvania Railroad, about 11 miles from Pittsburgh.

THE FIRM of Ruth, Patterson & Ruth of Alliance, Ohio, have leased the glass factory buildings at Minerva, Ohio, and have reorganized into the American Mfg. Company, F. J. Ruth, president; C. C. Patterson, vice-president and treasurer; R. C. Ruth, secretary, and C. A. Smith, general manager. They will manufacture nested stove pipe, elbows and eave trough hangers, patents of Mr. Smith; also their Columbian combined snip and crimper, at Minerva, Ohio.

W. C. HOPSON & Co., Grand Rapids, Mich., manufacturers of and dealers in tinners' and roofers' supplies, are sending out to their friends in the trade a very attractive catalogue of the goods which they make and handle. Roll and cap roofing and folded standing seam roofing are first illustrated and prices given. Various forms of sheet metal for roofing and siding follow, including corrugated steel sheets. Pressed brick siding, rock faced siding and Eastlake shingles are illustrated and described. Ridge roll, ridge cap and

black and galvanized iron are noted. One page is devoted to their Superior New Method roofing plates, which is their own especial brand. Eave troughs, miters, eave trough hangers, gutters, valleys, conductor pipes, conductor hooks follow in the order named. Speaking tubes, gasoline soldering furnaces and ventilators are noted, one illustration showing Barker's chimney top and ventilator, a style of ventilator which is made in four sizes and from 6 to 10 inches. Galvanized iron skylights occupy a couple of pages. The remainder of the pamphlet is given up to steel ceilings, window caps, moldings, cornices, crestings, finials, blowers and exhaust fans.

THE CINCINNATI CORRUGATING COMPANY, Piqua, Ohio, issue an illustrated catalogue relating to their various Sheet Metal products. The front page of the catalogue is entitled "What We Make," and the list underneath includes Corrugated Roofing, Siding, Ceiling, Arches, Lathing, Shutters and Doors, V-Crimped Iron Roofing, Standing Seam Plain Roofing, Roll and Cap Steel Roofing, Outcast Elastic Joint Roofing, Metallic Weather Boards, Ridge Capping, Beaded Metallic Ceiling, Galvanized Iron and Roofing tin. They are prepared to furnish estimates and material for buildings, including Cornices, Gutters, Conductor Pipe, &c. An interesting feature of the catalogue is a map of the larger part of the United States, with Piqua in the center, showing its relationship with the other principal cities, and its accessibility from all parts of the country. The goods enumerated above are illustrated and described at some length in the pages that follow, and the tinner, in fact, will find the catalogue quite a handbook for much that comes in his line. Toward the close reference is made to Gutters, Ventilators, Conductor Pipe, &c., while at the very end is an index. The volume is bound in dark colored covers, with stamped gilt title.

AN ITEM in a local paper published in Leon, Iowa, states that Robert J. Collier has concluded to locate his cornice works in that city. His plant will be fully equipped to do all kinds of cornice work in iron or copper and general sheet metal work. The proprietor will also manufacture iron fronts, pediments, window caps, finials, skylights, ventilators, cresting, &c.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 14 for work including the roof of the United States Post Office Building at Richmond, Ky. Drawings and specifications may be obtained from the Supervising Architect, at Washington, or from the Superintendent, at Richmond.

The fire loss of the United States and Canada during April, as estimated from the daily records of the *Journal of Commerce*, amounted to \$11,018,150, as compared with \$14,239,300 in the previous month and \$11,540,000 in April, 1894.

The trustees of the Industrial School, South Third street, Brooklyn, have received a gift of \$25,000 from the widow of James W. Smith, the late president of the Consolidated Gas Company of that city. The money is to be devoted to erecting a memorial building connected with the industrial school.

Niagara Improved Slip Roll Former.

The Niagara Stamping & Tool Company of Buffalo, N. Y., have put upon the market an improved roll former, with upper roll arranged in convenient manner and, by quick acting mechanism, to allow of removing work of small diameter that has been formed around the upper roll. The left housing has a hinged cap for the journal of the upper roll, secured by a handle. In order to remove the work the handle is disengaged, and by an upward movement of the eccentric lever on top of the right housing one end of the upper roll is raised and held suspended. By releasing the eccentric lever the top roll is returned to its proper position and, after throwing back the cap of the journal and the handle the machine, is

Niagara Improved Slip Roll Former.

again ready for work. The lower front roll, as well as the back or forming roll, is adjustable by means of thumb screws.

Keen & Hagerty.

Keen & Hagerty, manufacturers of tinware, Baltimore, Md., are about to largely increase the size of their plant. Their factory is now located in the large building in the rear of the salesrooms on South Calvert street, but plans have been completed for the erection of a factory building on the lot bounded by Race, Ostend and Clement streets and the Locust Point branch of the Baltimore & Ohio Railroad. This lot is 800 feet long and 300 feet wide. It is proposed to locate the main factory on Race street. This building is to be 320 feet by 60, five stories high and built of hard brick. The engine house, from which the power for the machinery in the factory will be derived, will be a separate building, 35 x 48 feet, in the center of the lot. This will be equipped with a 100 horse-power engine and 120 horse power boiler. The retooling and galvanizing buildings, each 40 x 50 feet in size, will be adjacent to the engine house. The ceilings of the main factory building will be high, the first 10 feet, the second and third 14 feet and the fourth and fifth 12 feet each. Two elevators and two fire proof stairways will be placed in the building, and on the west side a fire escape will be provided from the roof to the ground. Each of the five floors will be fitted up with the latest and most approved machinery for the manufacture of different lines of goods, and all the goods which the firm handle that are made of tin will be manufactured under this roof. The buildings will all be well lighted, heated and ventilated, the architects having given particular attention to questions of sanitation.

The railroad company will run a side track along the main building, so as to afford facilities for receipt of the raw material and shipment of the manufactured product. The work of construction will begin as soon as the contracts are awarded. Bids are now being considered. The firm now employ about 400 hands, but expect, with the new plant, to give employment to several hundred more. They are desirous of having the new works in operation before next year.

A handsome publication is received by us from the Bigelow Company, New Haven, Mass., relating to their steam boilers, foundry cupolas, driers, coolers and digesters for packing houses, vulcanizers, tanks and plate iron work of every description, Evans & Burgess

water front forges, &c. The pamphlet is quite a sumptuous publication, measuring 9½ x 12 inches in size, and contains many handsome engravings of the goods alluded to. Tables of sizes and descriptions are given.

The G. S. Blodgett Company, Burlington, Vt., manufacturers of Patent Portable Baking Ovens, are making a special Oven for jappanning Bicycle frames and other parts, which, they state, is meeting with great favor among manufacturers of wheels and those dealers having repair shops. These Ovens are also extensively used for core baking, bluing, hardening rubber goods, bronzing and in the finishing of various Hardware specialties.

According to an extensive and careful investigation recently made by United States Consul H. J. Sommer, Jr., at Bombay, India, the results of which are contained in the latest volume of consular reports issued by the State Department, there are about 14,500,000 acres of cotton cultivation in India, the product of which is about 2,800,000 bales a year. Mr. Sommer reports that the cultivation continues, as for centuries past, with the most primitive methods, the industry being entirely in the hands of the natives. Fertilizers are not known, and the ginning is as primitive as the cultivation. The cost of gathering and cleaning the cotton ranges from \$2 per acre in the Madras Presidency to as high as \$8 in the Punjab, and the yield per acre from 37 to 54 pounds in Madras to 50 to 98 pounds in Bombay, 80 pounds in the Northwest Provinces and 96 pounds in the Punjab. The consul does not anticipate that the cotton growing industry of India will at any future time become a serious rival to that in this country.

STEAM AND HOT WATER.

Steam Fitting Class of the New York Trade School.

The proficiency which has been obtained by the class in steam fitting at

by the committee to be of the highest possible grade, surpassing much work which is seen in buildings where a heating plant of the greatest efficiency is installed. This is remarkable when the

one just from school and one who had been in the pickle business. The class has been entirely in charge of Thomas E. McNeill, who, in his lectures, began with fundamental principles, and was

Water Fitters' Association, which is composed of John J. Smith, J. D. Clark, Charles J. Gillis, James Curran, Enoch Rutzler and S. J. Geoghegan. The workmanship of the pupils is said

two young men who had worked at heating and plumbing, one engineer, one gas fitter, one who had been in the leather business, one civil engineer, one who had worked at preserving fruit,

engineer, and for years was superintendent in the shops of Gillis & Geoghegan of New York, where he designed boilers of different capacity and laid out heating plants which

show his ability by their satisfactory operation.

The instruction in mechanical work was given by Chas. Coolidge, an expert pipe fitter, who has acted as foreman for engineer Wm. J. Baldwin in some of his most important contracts. Mr.

and return bend coils, which were made by the pupils. In addition to this, specially prepared plans were given to teach the method of piping where both high and low pressures of steam are used, and of getting the condensation back to the boiler by means of a re-

to the thoroughness with which Mr. McNeill laid out the course and instructed this class its usefulness far exceeded the expectations of those who suggested it as one of the trades to be taught at the New York Trade School.

In Fig. 1 we show a view of the workshop, with the young men engaged in various parts of the work taught at the school under the supervision of Mr. Coolidge. At the extreme right of the picture Mr. Coolidge is shown watching the work of his pupils. Examples of the work done by the pupils are shown in Fig. 2. The principal features of the work are a gravity system, an automatic receiver for the condensation and a pump for returning water to a boiler under pressure. The illustration also shows an automatic boiler feed. At the close of the course a rigid examination showed that each member of the class was thoroughly familiar with the principle involved in the operation of all that is shown in the picture, and appreciated the importance of avoiding any air trap and maintaining a proper pitch in the piping.

Our pictures are reproduced from photographs taken by one of the members of the class, Herbert L. Moore, Cambridge, Mass., who had previously graduated from the plumbing class of the school, and has been working at the trade regularly for five years.

Figs. 3 and 4 are reproductions of the plans of a school house with the heating system laid out, which were given to the pupils after they had sufficiently advanced in their course to erect the heating system in the workshop. These plans were exactly the same as would be furnished to a journeyman steam fitter working on a job. The young men took all the measurements, cut the pipe, made the header and return bend radiator coils, and erected the plant ready for operation. They worked in pairs, dividing the work between them, Mr. Coolidge taking no part in it except to pass the work when correctly done or to condemn it when defective on any cause. This work is now on inspection at the school, and it will readily be seen from its character that the graduates are well qualified to begin their career as steam fitters, under the instruction of a competent foreman, and are capable of excellent work.

NEITHER ordinary live steam nor "superheated" steam, says an English exchange, will heat a pipe thick and strong enough to convey it to a degree sufficient to produce a fire on wood, however dry. It will not even set charcoal aglow or in a blaze. But dry charcoal, when the heat is removed from it, being nearly pure carbon, will absorb oxygen from the air under favorable conditions so rapidly as to produce active combustion—that is, a glow or a blaze. The process of the origin of a fire from a steam pipe is: The heat from a steam pipe will in the course of time char or, as the chemists say, carbonize wood in contact or close to it. When this charring process extends to any depth in the wood it presents a surface full of fissures and cracks, thus exposing a large section to the action of the air. This process of charring drives the oxygen out of the charred portion and keeps it out while the heat is kept up. When the heat is removed the charcoal reabsorbs oxygen from the air, and if this action is rapid enough in a dry atmosphere combustion is the result. This explains why fires in steam plants and buildings heated by steam that

Fig. 3.—Basement of School House, with Boiler and Piping.

Coolidge impressed upon his pupils the necessity of working to an exact measure in all cases, and emphasized the fact that the proper pitch of pipes could only be determined by the spirit level. Mr. McNeill visited the class frequently, and when they had acquired sufficient

ceiver and a pump, and by a trap, hot well and pump, and for supplying the boiler with water by means of an automatic feed.

At the end of the term each member was examined individually, and it was highly gratifying that all of the class

skill in cutting and running pipe, he furnished them plans of buildings with the piping laid out just as it is received by a heating contractor. A boiler was located at a given point, and the mains and returns were run from it exactly according to the plans, connections being made with manifold coils, miter coils

who received certificates had become thoroughly acquainted with the methods mentioned. It is said to be the intention of the Trade School Committee to supply boilers for the class next year, so that after the boilers are piped they may be fired and the different systems may be seen in full operation. Owing

originate from steam pipes always occur after the pipes have cooled, generally during the night.

The Holly Gravity Return System for Utilizing Water of Condensation.

Through the courtesy of the *Electrical Engineer* we are enabled to present the following description of the system of returning water of condensation from engines and piping of steam plants devised by E. F. Holly of the Holly Steam Engineering Company of 344 Butler Exchange, Providence, R. I. The system has been installed in connection with a number of large steam plants, among others, quite recently, in the power house of the Broadway cable road in New York City, and further below we describe the equipment of the new Baltimore tunnel power house with the same system.

The Holly gravity return is a device employed to return water of condensation and entrainment back to the boiler

pipe, I, leads to a controlling valve, I', which is a small size of the reducing valve, Fig. 2, to be described presently. At the bottom is the return pipe H' leading to the boiler or boilers, if there are more than one. H² is a valve opening from H' into the sewer pipe. Between H' and the boiler there is a gate valve and a check valve in the order named.

The stand pipe separator is placed well above the water line of the boiler, the required distance varying under different conditions. It will be seen that if steam at practically boiler pressure is admitted to the separator and a means provided for raising the water of condensation from a receiver, a column of water will be formed which will rise to such a height above the water line in the boiler that its weight will be sufficient to open the check valve and the water will flow into the boiler. Returning now to the receiver, the operation of the device is as follows: All condensation is brought to the upper inlet of the suction T, which must be at a point below all pipes or separators to be drained. Steam, at as near boiler

ter from the steam as it is delivered from the receiver. The amount of steam flowing from the stand pipe is regulated by the reducing valve I' to a quantity just sufficient to raise the amount of condensation in each special case. This quantity of steam is so small as compared with the amount of water returned that the loss may be disregarded. If it is desired, however, this loss may be obviated by connecting the discharge from valve I' with a heater or radiator. The distance of the receiver below the boiler, or the linear distance of receiver and stand pipe separator from boiler, within limits which would be likely to occur in practice, does not interfere with the satisfactory working of the system in any way whatever.

One of the most interesting details of this system is the reducing valve referred to above and shown in section in Fig. 2, and known as the Holly Simplicity reducing valve. It consists of two chambers, A and B, screwed together as shown. A valve disk, C, is held in position by a guide and piston, F. Water collects in the space under F, and the piston with its surrounding

THE HOLLY GRAVITY RETURN SYSTEM FOR UTILIZING WATER OF CONDENSATION.

at the initial pressure, or less, and where the boiler or generator is located above or below the points or elevations at which the steam used is condensed, without pumps, traps or any similar device, and actually return the water by gravity. This is done by maintaining a column of water higher than the water line in the boiler, from which the condensation from all steam using devices will be continuously returned to the boiler. This is carried out in practice by means of a properly arranged receiver and stand pipe separator and suitable boiler connections, which will be readily understood from what follows.

The receiver, Fig. 1, is a cylindrical pipe provided with heads and a discharge neck shown at the right. The water of condensation enters through the suction T at the left hand, establishing a low water line, the position of which depends on the amount of work to be done in the receiver. The head at the right is provided in the center with a series of holes vertically arranged, their combined area being equal to that of the pipe G, which is the riser to the stand pipe separator, Fig. 4. The separator H is made either of 4 or 6 inch pipe, and is usually about 2 feet in length, and provided with caps at top and bottom. The riser G from the receiver enters the side, ending in an open T as shown. From the top a small

pressure as possible, is brought to the lower inlet. This steam acts as in an injector, to draw the water into the receiver, and also to maintain boiler pressure in the same. In starting the device the valve between return pipe H' and boiler is closed and valve H² opened. Steam at once flows from the receiver up the riser G to the separator and through the valve H² to the sewer, carrying the water of condensation with it in finely divided particles. This result is brought about by the peculiar arrangement of the holes in the head of the receiver. As soon as a steady flow of steam and water from receiver to stand pipe is obtained, the valve H² is closed and the valve between H' and boiler opened. Steam will continue to flow from the stand pipe through the small pipe I and reducing valve I', while the water which is brought up with the steam will fall to the bottom of the stand pipe, forming a column, which will soon reach a sufficient height above the water line in the boiler to overcome the resistance of check valve, plus the difference in pressure between stand pipe and boiler; and a return flow of water to the boiler is established which is continuous, requiring no further attention. This "working water line" in the stand pipe is somewhere in the vertical pipe H' and does not rise to the enlarged portion H, which is simply a separator to divide the particles of wa-

ter from the steam as it is delivered from the receiver. The amount of steam flowing from the stand pipe is regulated by the reducing valve I' to a quantity just sufficient to raise the amount of condensation in each special case. This quantity of steam is so small as compared with the amount of water returned that the loss may be disregarded. If it is desired, however, this loss may be obviated by connecting the discharge from valve I' with a heater or radiator. The distance of the receiver below the boiler, or the linear distance of receiver and stand pipe separator from boiler, within limits which would be likely to occur in practice, does not interfere with the satisfactory working of the system in any way whatever.

The flow of steam is allowed to continue until the pressure in the coils reaches the desired point, when the stem H is carefully lowered, letting the disk fall and thus reducing the flow of steam to a quantity just sufficient to maintain the pressure desired. The valve is now set, and all further regulation is automatic. The disk is balanced between the terminal pressure acting on its entire upper surface and the initial pressure acting on an area equal to that of the orifice D plus some reduced pressure between the disk and its seat acting on its lower surface. If

for any reason the pressure in chamber B should fall the disk would no longer be balanced and would rise, thus increasing the flow of steam and bringing the pressure up to the required point again. If, on the other hand, the pressure in B becomes too high the disk is forced down, the flow of steam diminished and the pressure reduced, and thus a constant ratio between the initial and terminal pressure is maintained at all times.

After the valve is once set for a certain ratio of reduction under the given conditions it requires no further regulation.

Fig. 3 shows an elevation of the system as it is being placed in the new

diameter. Included in this system are eight separators and two large expansion joints to be drained.

Beginning at the right, two lines of 2 inch pipe are carried for a distance of about 90 feet toward the receiver; to these return mains, four of the separators are joined by $1\frac{1}{2}$ inch pipe provided with suction T's. The object of the suction T in this connection is to insure a positive flow from the separator to return main, even though the pressure in the separator be slightly less than that in the main. For the remainder of the distance to the receiver the return is carried through a single line of pipe; the diameter being $2\frac{1}{2}$ inches to the point X and 3 inches

line in the boilers, where it terminates in an open T, inside the short 6 inch stand pipe separator H. At the top of the stand pipe separator is a $\frac{1}{2}$ -inch pipe, I, extending down to a point about 5 feet above the boiler room floor, and there provided with a $\frac{1}{2}$ inch Holly controlling valve for regulating the flow of steam from stand pipe, as previously described. As an indication of how little steam is necessary for this controlling feature it is only necessary to state that, if condensed, it would amount to about 600 pounds of water in 24 hours, as a maximum.

Assuming the evaporation of the boilers to be 8 pounds of water per pound of coal, we have 75 pounds of coal at,

Figs. 3 and 4.—Elevation of System in Baltimore Tunnel Power House and Detail of Stand Pipe.

tunnel power house of the Baltimore & Ohio Railroad Company in Baltimore. It is erected in combination with the duplex system of steam delivery which is to be used, and will continuously receive and deliver to the boilers all condensation and entrainment in the system between the large overhead separators at the left and the extreme ends of the high pressure mains A and A', which terminate in separators at the right, a distance of about 200 feet.

From the under side of the elbows on the vertical risers of steam mains A and A', $1\frac{1}{2}$ inch pipe is carried to the 3-inch return main in the engine room, to which it is connected by a suction T. This serves the double purpose of returning the condensation from the steam mains and furnishing steam at boiler pressure to the receiver. The receiver C is located, as shown, in a pit, walled with brick laid in cement; its dimensions are 6 feet long by 14 inches in

from there to the receiver. This return pipe is much larger than would be required to convey the water of condensation alone, but it is given this extra size to better utilize the slight grade obtainable and to insure a more perfect equalization of pressure throughout the entire system. The remaining separators are joined to the return main by $1\frac{1}{2}$ inch copper pipe, making long sweep bends to allow for expansion. Starting from the steam mains in the boiler room, a $2\frac{1}{2}$ -inch equalizing pipe, J, is run to the extreme end of the return main at the right, furnishing the latter with steam at practically boiler pressure.

The discharge pipe or riser G from the receiver is connected to the discharge neck at the end opposite to the return pipe B'; and rises above the engine room floor; then diagonally upward through the partition wall into the boiler room. It then ascends vertically to a point about 25 feet above the water

say, \$3 per ton, which equals 12 cents—the cost of returning more than 30 tons of water to the boilers. While the quantity is not great, it must be positive, continuous, and contain all the air entering the receiver. All pipes in the system including the stand pipe separator and receiver are to be covered with magnesia sectional covering and molded fittings.

While the Philadelphia Master Steam Fitters' Association is not included in the National Association, some of its members are independently connected with the larger organization.

AT THE COMMENCEMENT EXERCISES of the Technical School of Newark, N. J., a steam fitters' graduating certificate was awarded to John Cavanaugh and a plumbers' certificate to Edgar A. Metz.

Theoretical Velocity in Circulating Pipes—Hot Water Heating.

BY R. C. CARPENTER, ITHACA, N. Y.

The following discussion gives the velocity of circulation in hot water pipes from a purely theoretical standpoint. No allowance is made for friction or other losses.

Regarding the theory of motion in pipes for hot water heating, it may be said that this motion can be entirely explained by the effect of heat in expanding water, and thus causing the warmer liquid to ascend and the cooler liquid to descend. There is no doubt but that, in many cases, circulation is much accelerated by the formation of bubbles of steam in the heater, which lessen materially the weight of the heated column and cause it to ascend with great rapidity. This case is not, however, considered in this article.

There are two methods of considering the circulation, one of which neglects the mass of moving water and considers

moved, would be equal to the velocity which a body would acquire in falling through a distance of 1 inch. And similarly, in every case, when applied to a closed system, the velocity of water in the moving pipe would be the same as that of a body falling through a head equal to the distance between the heights of the heavier and lighter fluid in feet.

It is hardly necessary to point out that this proposition from a theoretical standpoint is erroneous, since it entirely neglects the consideration of the mass of water moved. It is a fact certainly known to all that the same force will not produce an equal velocity in bodies of different weights; thus, the force which will move 10 pounds at the rate of 5 feet per second will certainly not move 100 pounds at the same rate, and yet such is the supposition made in the formulae and rules of Mr. Hood. To be concise, he has held that the laws of statics are applicable to dynamics.

It is, I believe, quite easy to compute the exact rate of motion which bodies of different weights will pro-

duce, twice the force into the height. Or in the shape of a formula *

$$(2) v = \sqrt{\frac{2g(B-A)h}{B+A}}$$

h being the height fallen through.

In other words, if f equals the falling force, we have by proportion
